Austrian bakers are now compelled by law to use at least thirty per cent potato meal in making their bread. The bureau of chemistry's potato meal bread has been baked with from 25 to 50 per cent potato meal and the remaining percentage wheat. The most satisfactory loaves in combining economy and appearance were those made with the minimum percentage allowed in Austria or less. The loaves made with more than 30 per cent potato meal were not so satisfactory as they were heavier and less attractive in form. The bread has a rather coarse texture and dark appearance but possesses a distinctive and agreeable flavor. It also retains moisture for a much longer period than ordinary wheat bread.

The bureau of chemistry used the imported "potato flake" in some of its experiments, and in others, meal made by slicing, milling and drying potatoes on a small scale in its laboratories. It should be added that such ordinary "potato flour" as is on our American markets is not the same as the German "potato flake" or Walzmehl which has given such satisfactory results in the experiments.

The question has been raised as to whether the ordinary cooked potato might not be satisfactorily substituted for the prepared potato meal. The experimenters believe that it might serve the same purpose if used in just the right proportion, but this would be difficult for the average housewife to determine as there is great danger of using too much and producing a very soggy loaf. However, the custom of adding a very little potato is already used by many housekeepers to keep their bread moist and this practice can very well be recommended for more general use.

New Ways of Using Potatoes

Cultivator Monthly Household Help Contest Proving More Popular Than Ever

Potato Soup

Four medium sized potatoes, one-half a small onion, one pint of milk, one tablespoon of butter and one heaping teaspoon of flour. Pare the potatoes, cut in cubes and cook until tender, in plenty of water. Slice the onion very thin and add to the potatoes. Drain off half the water and add the pint of milk, also the butter. Rub the flour smooth with a little of the cold milk and when the potatoes are boiling, thicken. Add salt and pepper to taste and send to the table as hot as possible. This will serve six people.—Mrs. Willis A. Grove, Inglewood.

Potato Biscuit

One cup cold boiled potatoes mashed, two cups flour, one cup sweet milk, one tablespoon shortening, one tablespoon sugar, one teaspoon salt, three teaspoons baking powder. Roll and cut as for other biscuits and bake in hot oven—Mrs. F. Dahlstrom, Fairoaks.

Southern Potato Biscuit

Bake four good sized potatoes well done. Remove from skins and mash well. Add a teaspoon each salt and sugar and two-thirds cup lard and butter mixed. Beat well then add one egg well beaten. When cooled to lukewarm add one yeast cake dissolved in half cup of warm water, stir well and then add flour to make stiff batter. Set in a warm place to rise. When raised add more flour and let rise again. About two hours before a six o'clock dinner add flour to make like biscuit dough, roll out and cut into biscuit. Grease muffin rings, place one biscuit in ring, dip one in melted butter or lard and place on top of other. Repeat until all are in pan. Set in a warm place to rise. Bake in moderately hot oven. Always put two in same ring, one on top of the other. Set about 10:00 a. m. for six o'clock dinner.—Mrs. A. L. Vandiviere, Moreno.

Potato Doughnuts

Five good sized potatoes boil and mash, one teaspoon butter, two cups sugar. Mix while hot and beat well. Let cool, add three eggs (beaten), one cup sweet milk, pinch of salt and nutmeg, five teaspoons baking powder in a little flour. Flour enough to roll out, and fry in hot grease.—C. A. C., Loomis.

Potato Biscuit

Into one pint of hot potato, mashed smooth, mix one teaspoon salt, two tablespoons butter, one pint sour milk into which has been stirred one teaspoon soda, and flour enough to make a soft dough. Make into small biscuits, let stand in a cold place for an hour, and bake in a quick oven.—Elma Iona Locke, Santa Monica.

Potato Puffs

One cup cold mashed potatoes, one and one-half tablespoons cooking oil (or melted butter), one-fourth cup sifted flour, one cup yellow corn meal, one-half cup milk, two eggs, two teaspoons baking powder, one level teaspoon salt. Drop into hot greased gem pans and bake about 25 minutes. —Mrs. C. D. Luedke, Tropico.

Potato Hotcakes

A German dish. Take seven fair sized potatoes, peel and grate them raw, also peel and grate two fair sized onions with potatoes, then add three tablespoons of flour, two eggs and salt to taste, mix all well, and bake in a griddle pan, a spoonfull at a time, just as you would hotcakes. Pan should be well greased, and cakes fried to a nice brown. Eat with apple sauce or anything preferred.—Mrs. L. S., Escondido.

Potato Pancakes

Two cups mashed potatoes, two cups milk, one cup flour, one egg, one

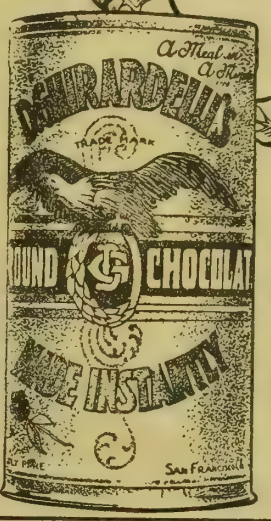
One egg; one cupful milk; one teaspoonful corn-starch; one-half cupful sugar; two teaspoonfuls of Ghirardelli's Ground Chocolate; one teaspoonful vanilla. Scald milk and add the corn-starch which has been dissolved in a little of the cold milk; beat egg and add to the mixture with the sugar, chocolate and vanilla.

Chocolate Sauce

There is nothing that adds so much to a pudding, blanc-mange, custard or cake as a delightful chocolate sauce made with

Ghirardelli's
Ground Chocolate

The rich flavor of this most palatable, most convenient, most economical form of chocolate has made it the standby of good cooks for over sixty years.



As a nourishing, healthful, economical beverage for daily use Ghirardelli's Ground Chocolate is pre-eminent.

Its healthful purity is retained in hermetically sealed tins.

teaspoon baking powder, one teaspoon salt. Stir the potato, milk and beaten egg thoroughly together. Put the flour, baking powder and salt in the flour sieve and add last. Bake like pancakes on a hot, well-greased griddle until a light brown. This is an excellent substitute for breakfast bread and is an economy, in that it utalizes small portions of left-over potatoes.—Caroline M. True, Lancaster.

Potato Pancakes

Pare and grate six medium sized potatoes. Drain off the liquid and add two teaspoons salt. Beat the yolks of two eggs and fold into the potatoes. Whip the whites until quite stiff and add last. Grease a griddle pan lightly and pour from the spoon into cakes the size desired. The potatoes may be ground, but better results are obtained by grating them. This recipe makes a good sized batch, and many prefer the cakes when warmed up the next day.—Mrs. D. M. McPherson, Los Angeles.

Potato Pancakes

Peel and grate raw potatoes until you have one quart. Add one pint of milk, three eggs, salt and baking powder, and enough flour to hold together. Beat vigorously. If you have a large family you will need double the recipe.—Mrs. A. L. Dupray, Carpinteria.

Delicious Potato Pancakes

Peel and grate enough raw potatoes to make one pint. Add one teaspoon salt, three well-beaten eggs, one-half cup milk, two teaspoons baking powder, and one-half cup flour, or enough to make thick as any pancake batter. Bake same as any other pancakes.—Mrs. J. F. C., Hemet.

Potato Bread

In the afternoon or evening make a sponge as for any white bread. In making this sponge I boil three or four good-sized potatoes. When done drain the water off and mash potatoes thoroughly and salt as for table use. I use a tablespoon heaping full of the potato and the water in which they were boiled, adding enough warm water to make three pints with the water in which the cake of yeast is already soaking. Add two tablespoons of granulated sugar and two rounding teaspoons of salt, or to suit taste. Then stir in white flour enough to make a stiff batter. Beat well. Set in a warm place to rise over night. If it is cool weather I warm the flour. In the morning I remash the remainder of the potatoes cooked the previous day.

For each pint of sponge allow four heaping tablespoons of mashed potato, two rounding teaspoons of shortening, one tablespoon level full of sugar, soda size of a large bean, with or without one egg.

Mix well with a spoon and stiffen with equal parts of graham and white flour, well mixed. Knead and set in a warm place to rise. When light make into loaves. Let rise again and bake as white bread.

We find this excellent, especially when made into toast, with butter, for breakfast.—Mrs. J. F. Delzell, Lindsay.

Potato Bread (Sponge Method)

One cake yeast, one quart lukewarm water, two tablespoons lard, one tablespoon salt, four quarts sifted flour, two tablespoons sugar, one quart mashed potatoes. Dissolve the yeast and sugar in one quart water, and add to it the potatoes and one quart flour. Beat well. Cover and set in a warm place to rise. When well risen, add to it the lard and salt and remainder of flour, or enough to make a moderately firm dough. Knead thoroughly. Place in a greased bowl, cover, and let rise until light; mold into loaves, filling pans about half full. Set in a warm place and when light bake 40 to 50 minutes, reducing the heat after the first ten minutes.—Mrs. Minnie Claussen, Fallbrook.

Potato Doughnuts

One cup sugar, shortening about the size English walnut, two well-beaten eggs, cream together. Add one cup hot mashed potatoes, one cup milk, two teaspoons baking powder sifted with flour enough to make soft dough. A little salt, any flavoring desired. Fry in hot cottolene.—Mrs. L. L. Wilcox, Banner.

Delicious Sponge Cake With Potato Flour

Yolks five eggs beaten, one cup sugar, two teaspoons flavoring, five whites beaten stiff, one-half cup potato flour, one-half teaspoon baking powder (level measure). Beat the yolks until thick and lemon colored. Add the sugar gradually, continue beating until all is added. Add the flavoring, fold in the stiffly-beaten whites and the flour mixed with the baking powder. Bake in an angel cake tin.—Mrs. H. W. Schroeder, Marshall, Minnesota.

Potato Cake

One cup butter, two cups sugar creamed, one cup mashed potatoes, one cup seeded raisins, one cup blanched almonds cut coarsely, one-fourth pound finely chopped citron, four eggs beaten separately, one teaspoon soda, four cups flour, two teaspoons baking powder mixed with flour, lastly add beaten whites of eggs and flavor with one-fourth teaspoon bitter almond extract. Bake in loaf pan in moderate oven.—Kathryn Jones, Chicago Park.

Potato Spice Cake

One cup butter and two cups sugar creamed, one cup mashed potatoes, four eggs beaten, one-half cup sweet milk, two cups flour, two rounded teaspoons baking powder, one-third teaspoon cinnamon, one-third teaspoon cloves, one-third teaspoon grated nutmeg, one cup coarsely-chopped walnut meats. Beat vigorously. Add to above batter two-thirds cut bitter chocolate filled to top of cup with hot water and blend evenly. Bake in bread pan in moderate oven. —Mrs. Burle J. Jones, Nevada City.

Potato Cake

Two-thirds cup butter, two cups granlated sugar, two cups flour and pinch of salt, two cups mashed white potatoes, one-half cup chocolate, two cups chopped walnuts (if preferred), four eggs, two teaspoons baking powder, one-half teaspoon ground cloves, one teaspoon cinnamon, three-fourths teaspoon nutmeg. Cream butter and sugar and add yolks of eggs beaten light. Add milk and mash potatoes, which have been beaten light with a little milk, spices and chocolate, which has been melted. Sift baking powder and salt well with flour. Beat the whites of eggs stiff. Put in flour, then whites of eggs, one teaspoon of vanilla and lastly nuts. Bake in loaf. —Helen Palla, Linne.

Chocolate Potato Cake

Mix together one cup cold mashed potatoes, two cups sugar, one-half cup butter, three well-beaten eggs, one cup sweet milk, two tablespoons grated chocolate, two teaspoons of a mixture of ground nutmeg, allspices, cloves and cinnamon and two teaspoons baking powder sifted in a tablespoon of flour, add two more cups of cold mashed potatoes. Beat well, mix in half a cup of chopped walnuts and one cup of stoned raisins. Bake in a moderate oven for 30 minutes, placing the cake pan in center of oven. This recipe never fails if directions are closely followed. Be sure and let it bake until done.—Mrs. Jenny Cummings, Turley, Oklahoma.

Potato Cake

One cup butter, two cups sugar, four eggs, one-third cup sweet milk, two cups sifted flour, four tablespoons grated chocolate, one teaspoon cloves, one teaspoon cinnamon, one teaspoon nutmeg, two teaspoons baking powder, one teacup cold mashed potatoes, one cup chopped nuts. Bake 45 minutes.—Mrs. Ora Jackson, Modesto.

Potato Caramel Cake

Two-thirds cup butter, two cups granulated sugar, two cups flour, one

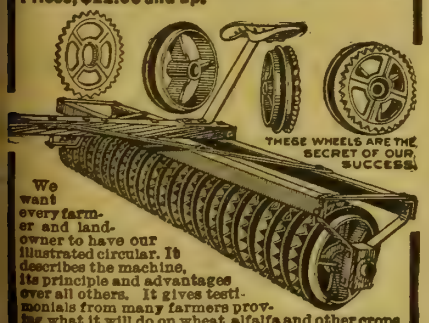
3 MACHINES IN 1

A perfect seed bed is as important as to sow or plant. The Western Pulverizer, Packer and Mulcher makes a perfect seed bed and leaves a loose mulch on top to retain the moisture in one operation. It will double profits on crops. Made in 8 sizes, 1 and 3 sections. Sold direct to you on one year's trial. Prices, $22.00 and up.



We want every farmer and landowner to have our illustrated circular. It describes the machine, its principle and advantages over all others. It gives testimonials from many farmers proving what it will do on wheat, alfalfa and other crops. It contains valuable information on how to prepare the soil for better results. Send for this circular today, whether you want to buy or not.

Orange County Dedication day at e Panama-Pacific is April 19.

cup mashed potato, one-half cup sweet milk, four eggs, two teaspoons baking powder, one cup grated chocolate or two squares melted, one cup chopped walnuts, one teaspoon each of cloves, cinnamon and nutmeg (half as much if preferred). Cream the butter, sugar and yolks of eggs. Add the milk, mashed potato, spices and chocolate. Sift the flour and baking powder and beat the whites of the eggs to a stiff froth. Sift the sifted flour into the batter and lastly beat in the whites. The nuts are added just before the cake goes into the tins. A nut cake is always finer if the nuts are put in the last thing. This makes a large loaf.—R. Ferris, Woodlake.

Potato Cake

One scant cup butter, two cups sugar, one cup hot mashed potatoes, four well-beaten eggs, one-half cup milk, one teaspoon vanilla, two cups flour, two teaspoons baking powder, one and one-half cups walnuts ground fine. Bake in either layers or loaf. Use chocolate frosting.—D. E. C., Hemet.

Potato Gems

One egg beaten well, to which add one cup of sweet milk, then one cup of cold mashed potatoes. Sift in one cup of flour in which is a rounded teaspoon of baking powder and one-fourth teaspoon of salt. Beat for several minutes, pour in greased hot gem pans and bake in a quick oven.—Mrs. H. P. Dralle, Sanger.

MARCH PRIZE CONTEST

A splendid response has come to the Cultivator's request for recipes telling how to use potatoes otherwise than as vegetables. We have recipes for potato bread, potato biscuits, potato pancakes, potato doughnuts and potato cakes which everyone of our women readers will be eager to try.

Request has been received that the March contest be for rice recipes. How do you cook rice?

For best recipe, $2.00 cash; for second best, $1.00; for all published, six months' subscription to the California Cultivator.

Recipes should be in this office by the morning of Thursday, March 11, Write on one side of paper only. Send name of member of your family now receiving the Cultivator that the six months' extension of subscription may be credited to that name.

PRIZE WINNERS

Winners in the potato recipe contest for February: First prize, Mrs. J. F. Delzell; second prize, Mrs. C. D. Luedke.

HOUSEHOLD QUERIES

Canning Pimientos

The Cultivator has request for information as to canning pimientos. Several subscribers will appreciate information regarding canning both pimientos and chiles.

Pickled Limes

Can you tell me how to pickle limes?—Subscriber, Pasadena.

Lemons or limes may be pickled as follows: Use three ounces of chillies, four ounces of garlic, four ounces of turmeric, three ounces of green ginger. Pack the lemons or limes in a jar, sprinkle thickly with salt, cover and let stand for one week. Pound the garlic, chillies and turmeric together, and add the ginger sliced; add just enough vinegar to make a paste. Stuff this into the limes, tie them together and stand in glass or stone jars for one month, when they will be ready for use.

NO NEED

"Won't you look at some nice ties, sir?" said the clerk.

"What do I want with ties?" replied Smith. "Can't you see that I'm letting my beard grow?"

Try this New Blackberry At Our Expense

TO CULTIVATOR SUBSCRIBERS ONLY—To have this New Macatawa Everbearing Blackberry tested in as many localities as possible, claiming it to be the sweetest and best table berry on the Coast, the propagators of this berry have made us a proposition for supplying same in shipments of 6 plants each by parcel post, all charges paid.

Their description of the Macatawa is as follows: "It is a cross between the true Giant Himalaya and the Eldorado. The fruit is very large and sweet, in fact, it is the sweetest blackberry grown. It is coreless and almost seedless; very solid, jet black when ripe and can be shipped 1000 miles without bruising. The shape is oblong, very uniform, averaging three and one-half inches around one way by three and one-fourth inches the other way. The bloom is almost semi-double, about the size of a silver dollar. So far all who have tested this berry say it is the sweetest and best flavored berry they ever tried."

DO YOU WANT SIX OF THESE PLANTS? If so send in the regular subscription price for one year's subscription to the Cultivator, new or renewal; add 25c to cover cost to the nursery of postage and packing, and the six plants will be carefully packed and mailed you promptly without additional charge.

REMEMBER—The regular price of the 6 plants alone is $1.00 postpaid. Only one shipment will be made to a customer, but subscriptions and plants may be sent to different addresses.

Citrus Fruit Market

LOS ANGELES, February 17, 191[illegible]

With continued wet weather in orange growing sections and a generally improving market, the fruit now on track is offered a very good opening. Compared with other years the present prices are fully as good or a little better than average. With this condition as soon as the rain ends and picking conditions are improved, every packing

house will be worked to the limit. Florida's crop is somewhat over two-thirds marketed. Lemons show no material change and a disposition on the part of the grower is noticed to hold for better prices when warmer weather comes.

NEW YORK, Feb. 15.—Twenty-four cars navels, one mixed car and two cars lemons sold. Market firm on navels, slightly better on lemons. Partly cloudy.

NAVELS—	Avge.
Mahala, L.V.W. Brown	$2.50
Swastika, L.V.W. Brown	2.25

Pansy, M.O.D. Colton, and Silver Foam, ch. (straight car)	$1.25
Baseball, Ball & T., Downey	1.10
Green Banner, Suth. Ft. Co.	1.32½

CHICAGO, Feb. 15.—There is a brisk trade in apples. Not much storage stock left, and supplies are coming out of coolers freely. Apples, boxes, western stock, 1.50@2.25; barrels, out of coolers, 2.25@2.50; some finer grades up to 4.00. Oranges, boxes, California, 2.00@2.50; Floridas, 1.50@2.00; Tangerines, straps, 2 boxes, 1.75@2.50. Lemons, boxes, Californias, 2.75@3.35. Kumquats, 12½@15 per quart. Limes, barrels, imported, 12.00. Grapefruit, receipts slackening, but supply ample, box, 1.75@2.00. Strawberries, supply well cleaned out at 30@35 per quart.

The Silva Bergtholdt Company is sending out a final "teaser" in a stock list with attractive prices which shows this concern to be carrying an immense stock of fruit trees. The planting season is drawing to a close.

Burpee's Seeds Grow

THE truth of this famous slogan is proved by thousands of pleased and permanent customers. The Burpee Idea of Quality First—"to give rather than to get all that is possible"—combined with efficient service, has built the world's greatest mail order seed business. We deliver seeds free by parcel post, and have not advanced prices because of the war. Write today for **Burpee's Annual, *the* "Leading American Seed Catalog" for 1915.** It is mailed free.

Studebaker

WAGONS BUGGIES HARNESS

A STUDEBAKER THAT HAS SAVED MONEY FOR ITS OWNER

I bought my Studebaker from your agent, D. M. Smith, at Flint, Mich., in 1876, and have used it continuously on my farm.

I have a farm of 140 acres, with good buildings, and this wagon hauled all the material.

Two years ago my son put on three tons of sugar beets and hauled it over frozen ground to the scales.

Last summer we hitched a loader behind it and drew our hay to the barns.

The wagon had not been sheltered half the time for the last twenty years yet has never broken a wheel or an axle.

John H. Wood,
Flushing, Mich.

Hitches other wagons to his 37 year old Studebaker

A WAGON thirty-seven year old that can stand the strain of having another laden wagon hitched to it might be called a remarkable example of wagon building.

But it is a Studebaker—and Studebaker wagons are built to withstand any reasonable strain; and to last, not ten or twelve years, but a lifetime.

An investment that pays

Think what it means to get 37 years and more of work out of a wagon.

Cuts down the cost—doesn't it?

Especially if you compare 37 years with the 12 years an ordinary wagon lasts.

Studebaker wagons last a lifetime—because they are *built* to last. Wheels, body and gear are the work of experts. Air-dried lumber, tested iron and steel make for strength and lasting qualities.

Don't be imposed upon by the wagon salesman who wants to sell you a farm wagon "Just as good as a Studebaker."

Remember this—a Studebaker farm wagon is sold as cheaply as it is possible to sell a *good wagon*.

Studebaker Buggies and Harness are also built to last.

Little Stories of Success

No. 3

Paul Talbott of Kings City ordered another Caterpillar last June. He already had two, but he found he needed another to farm his 4,000 acres. He knows tractors, too, as he tried a 100-h. p. round-wheel gas tractor first, and then went back to horses. Then he bought a steam tractor to run his stationary thresher and found it wouldn't steam on the short straw we had two years ago. Then he bought a Caterpillar. That Fall he ordered another one. This June he writes: "In the past two years these two Caterpillars have saved me about $16,000 over the old way of farming. I have now placed my order for a third one."

Mr. Talbott has proved for himself what a steady, powerful motor the Caterpillar has for belt work, as well as the saving of time and money in traction work.

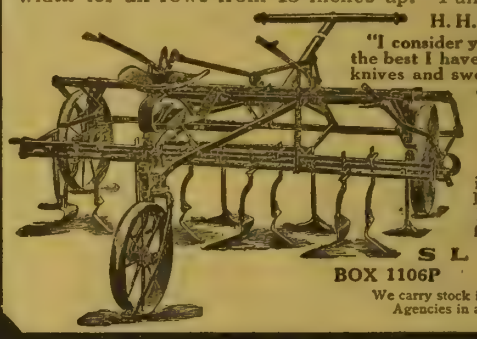
Planet Jr. Beet Cultivator

The greatest time- and labor-saver ever invented for beet and bean cultivation is this **No. 3 Planet Jr 4-row Sugar Beet and Bean Horse Hoe.**

Especially adapted to western requirements by a practical farmer and manufacturer who studied the vital needs among largest beet-growers. Cultivates four rows of beets at a time, 18 to 22 inches apart. Works equally well for beans. Equipped with patent hoes that hoe close at surface and curve away from roots. Front of hoe acts as leaf-guard. Two-wheel seat rig for 3-row cultivation. Wheels are changeable in width for all rows from 18 inches up. Fully guaranteed.



H. H. Castwood, Oxnard, Cal., writes: "I consider your No. 3 Beet Cultivator by far the best I have ever seen or used. I think the knives and sweeps as near perfection as they could be made."

New 72-page Catalog (168 illustrations) **free**

Describes over 55 tools, including Seeders, Wheel Hoes, Horse Hoes, Harrows, Orchard- and Beet-Cultivators. **Write postal for it today.**

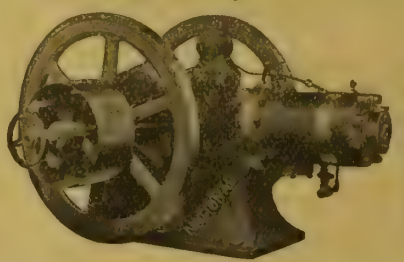
National Oil Engine

An engine which will burn fuel costing three cents per gallon, and at the same time is an engine with 90 per cent less parts, is the engine for the rancher to buy.



A LETTER FROM A USER OF THE NATIONAL OIL ENGINE

Kingsburg, Cal., Dec. 19, 1913.

National Steam Pump Co.,
Los Angeles, Cal.

Gentlemen:

I bought the first NATIONAL Oil Engine sold in this State. Any one wanting an engine let them come and see my 15 H. P. pulling a 6-in. centrifugal pump lifting thirty feet throwing two cubic feet moving one foot per second, using low grade fuel. I will answer any letter.

Truly yours,
(Signed) L. E. HURLEY.

We guarantee the saving in fuel expense and purchaser's own judgment will tell him that in doing away with 90 per cent of the small, delicate and complicated parts, springs, gears, etc., that he is getting away from engine trouble when he invests in a National. 1915 catalog now ready.

Leading Oakland Superiorities

Great Strength with Light Weight

High Speed Motor with Great Power

Low Center of Gravity with Usual Road Clearance

Flying Wedge Lines with Least Wind Resistance

Economy with Luxury

And Each One Spells Economy

Economy is a result of the Oakland's great strength with light weight—economy in fuel, in tires, in upkeep.

Economy is a result of the Oakland's high-speed, balanced motor with great power—economy in the even flow of gases, in reduced wear and strain, in added efficiency.

Economy is a result of the Oakland's low center of gravity with usual road clearance—economy in sure, safe, steady going and the sturdy, compact construction of every unit of the car.

Economy is a result of the Oakland's flying wedge body lines—economy in the reduction of wind resistance and decrease of fuel consumption.

Economy is an ever-present feature of Oakland service; and Oakland service is complete, as a demonstration will show you.

Economy in upkeep throughout—but luxury in appearance, in appointments, in riding qualities.

The Oakland dealer near you will take you for a ride. Write for his name and address. Illustrated catalog free.

Rural Californian combined with California Cultivator

Vol. XLIV No. 8 LOS ANGELES: THURSDAY, FEBRUARY 25, 1915 One Dollar Yearly

Opening Day at the P. P. I. E.

Greatest Number of People Ever at any Such Event. The Panama-Pacific International Exposition Opens at San Francisco February 20. Opportunity for an Education, Especially in Agriculture and Horticulture, at This Great Fair. Editorial Correspondence

IT'S Open.

The "Ohs!" the "Ahs!" the 'What do you think of thats?" have been said. The cheers have been cheered, the songs have been sung, the flags have been waved and unfurled. The fountains were loosed, the bombs fired and the many colored lights flashed and man said, "It is finished." All because the President of the United States, 3,000 miles away, pressed an electric button—also because man, man in blue overalls, has done his work and done it well.

"It" means, of course, "1915", "The Fair," "The Jewelled City," "Fairyland of Color," "The $50,000,000 Show" or, more properly and officially, "The Panama-Pacific International Exposition."

Adjectives have all been worn to a frazzle and as there are none of sufficient super-superlativeness to fit the case, perhaps "It's open" is an all sufficient announcement to Cultivator readers. All are going and that's better than reading descriptive stuff as to what the other fellow saw.

But about the opening day. It opened showery. However, the "pilgrimage" started. The pilgrimage was made by the president's representative, Franklin K. Lane, Governor Johnson, Mayor Rolph, exposition officials, newsboys and some thousands, or tens of thousands and even twenties of thousands, of others. Everybody walked. It wasn't any common affair where some big one was pulled in a coupe by the "populace." We were all populace. It was our show.

Naturally it was the greatest ever. St. Louis, Chicago, Buffalo and all other world's fairs' first day records fade away. Even first week's records in former shows barely reach "our" record of well up toward a quarter million. As one lady said, "Honestly, I didn't suppose there were this many folks in the world that I didn't know." She was sitting on a rubbish can waiting for her husband to return with something to eat. The crowd was so thickly massed he failed to arrive near enough to the Frankfurter sandwich foundry to get a supply.

It was like the movement of a mighty glacier. When one got into it he moved and as "it" directed. Where the directing force was it was impossible to see. I wondered why some did not go into the buildings. There are hundreds of them and nearly all were open. I soon drifted into and part way through the Palace of Machinery—eight acres in it. Then I wondered why some of the people didn't get out. I did as soon as I could and found a breathing spot on a velvety lawn with a "keep off the grass" sign. This morning—the morning after—these lawns on which McLaren and his great force of gardeners have worked for months and all for this day, were a most pitiful sight, tramped into mud with little semblance of velvety green, at least in many spots.

This crowd was scattered everywhere over the 600 acres. The grounds are two and one-half miles long, though in some portions quite narrow.

The showers with which the day opened continued occasionally till about an hour before the moment of unfurling and official opening. The clouds then broke away and almost as if by magic the burst of sunlight flooded the jewels of the great 435-foot tower and the sparkling pendants answered back to the thousands of waving flags, pennants, hats, umbrellas and handkerchiefs. In fact, everything movable got into action at 12 noon.

Then the crowd broke up or tried to, but couldn't get away from itself. Everyone staid till evening to see the illumination. That's when the exposition shines. A battery of a half a hundred searchlights from Fort Moro with scores of others on other vantage points plays on different parts of the grounds, but always some of them are on the Tower of Jewels. Then when some dozens or scores of electric bombs are used to bombard the sky and searchlights with color screens of red and green, orange and purple and various shades are used to bombard the smoke drifting over the buildings, the effect is—but I find the desire to

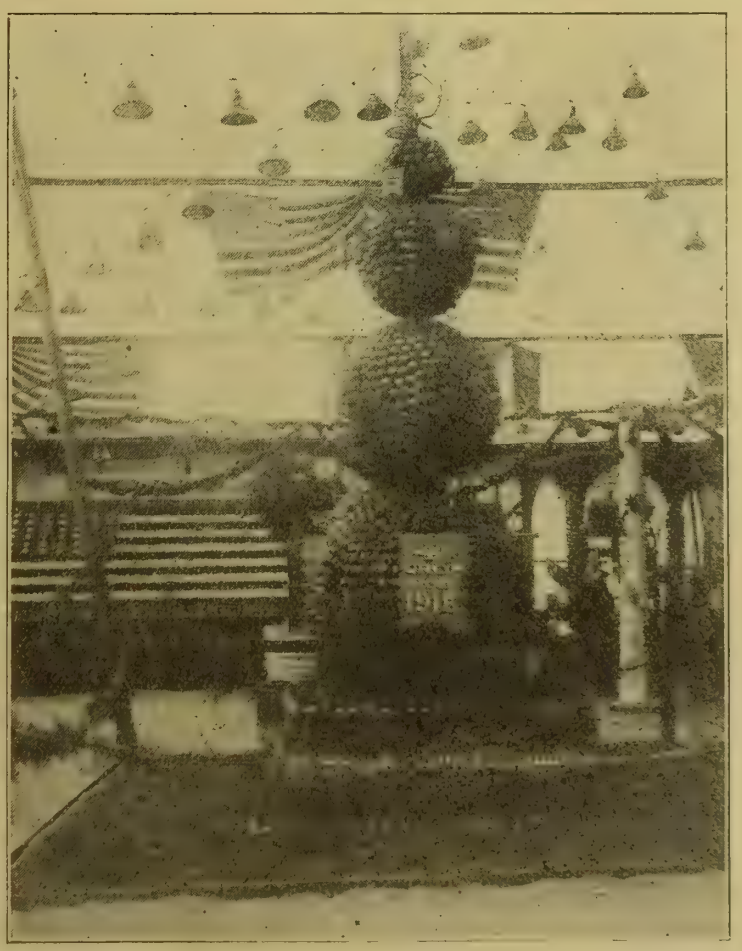
The National Orange Show

The National Orange Show Draws Out Large Attendance. Finest Exhibit Yet Made of Citrus By-Products. Fine Fruit, also Many Orchard Appliances and Accessories Exhibited

IN the by-products and household booth of the National Orange Show, just held at San Bernardino, were to be seen exhibits of orange bread, cake, pie, cookies, tarts, pudding, salad, sauce, marmalade, jam and preserves, jelly, candy, candied peel, ades and punches, extracts, pastes, orange puffed rice, in fact, I believe nearly everything edible unless it was soup—the first course of the meal only seemed to have been left out—but certainly the housekeeper's section of citrus California did itself proud in its effort to show what could be done with oranges, lemons, limes and grapefruit in a culinary way. Nor should we overlook the citrus face cream, which formed a part of the exhibit. What is better, this section was more crowded than any other.

By the way, it is in order to refer to the announcement made during Orange Show week that the by-products of the citrus are to be a factor which will add materially to the citrus industry of the future. The exchange, or rather the members of the California Fruit Growers' Exchange, are organizing a concern to handle low grade citrus fruits in a way which will make them bring more money and take them from competition with better grade fruits in the markets.

This is the fifth of the National Orange Shows, the biggest, and in many respects the finest. Various citrus growing sections are not so generally represented in the feature exhibits as in some former years, but there is a finished look to those which



RIVERSIDE'S EXHIBIT PORTRAYING THE FOUR DECADES OF THE WASHINGTON NAVEL ORANGE

are there and a quality of fruit in all the exhibits which has never been equalled. I do not believe that finer lemons were ever exhibited. Montecito, Santa Barbara County, has one of the very finest exhibits along this line. We were assured that the fruits had not been waxed, oiled, or even rubbed, but were exactly as they had come from the packing house, having only been through the washing room.

One of the most striking exhibits was that of Riverside, erected in honor of the fortieth anniversary of the navel orange in California. The exhibit consisted of a series of four globes made of oranges, and in varying size from top to bottom. The small globe at the top represented the first decade of the navel industry, the next the second decade, and so on to the fourth, many times the size of the small one at the top. It is very probable that when the fifth decade is added it will still be immensely larger, and such exhibits as this one just noted at San Bernardino will aid in advancing the industry. It will aid not so much because of the advertising in attracting attention to the industry as in calling attention to methods of packing and methods of food preparation and methods of utilizing the by-products until the wastes will be saved.

The box exhibits from the fruit quality and commercial pack standpoint were almost perfect. The judges , State Horticultural Commissioner A. J. Cook, B. A. Woodford, former manager of the California Fruit Growers' Exchange, and Mr. W.

Citrus and Tropical Fruits

THE OAK FUNGUS DISEASE OF FRUIT TREES

By W. T. Horne Before State Fruit Growers' Convention

THE oak fungus disease or fungous root rot caused by the fungus, Armillaria mellea is a very common and a very serious disease of orchard trees in California. Its most striking characteristics are its marked localization and slow progress. The fungus which causes it probably existed in the roots of wild trees, attacking living roots but working so slowly that vigorous trees were not killed, and also persisting in the dead wood, causing roots to decay. It appears that many wild trees are infected in nature and I do not have sufficient evidence to say that oaks are more subject to infection naturally than other trees. Not all roots in the soil are infected, so that we can not say that because an oak tree grew in a given place oak fungus will appear there.

When the roots of a fruit tree come sufficiently near to infected wood in the soil fungus grows over and attacks the living roots. We must believe that this may happen long after the original clearing, because the fungus will not die out of the soil until the root in which it lives is very completely decayed. It is probable that new infections have appeared ten years after planting an orchard.

The course of the disease is now well understood by fruit growers. Often several trees have died before particular attention is given to the trouble. It is then found that two or three trees nearest to those which have died are dying or diseased. The trouble can be recognized with certainty only by an examination of the roots. Usually two or three years will elapse after the first signs of weakening have appeared before the tree dies, and after the first collapse some part of the tree may start up and continue to grow for an indefinite time, finally to be blown over by the wind or to die completely if it does not first exhaust the grower's patience and get pulled out. Two or three years or more may pass before the disease spreads to the next tree. It is thus seen that the rate of spread is slow but we have maps of spots in citrus orchards 15 years old where 25 to 30 trees have been lost. In some cases practically whole orchards have been swept over. Some have not been replanted. Others have been replanted, part of the replants living and others dying, so that the result is very discouraging. After the disease has become well established occasional new centers of infection appear. It is believed that probably such new infections arise from a diseased root being carried along and, before it dries, plowed under near a healthy root. I have picked up from the moist cover crop a piece of diseased root which had fallen from the cart in which a dead tree was being hauled from the orchard. If this root had been plowed under so as to come near a healthy root the fungus would almost certainly have grown over into the healthy root and in a few years another tree would have died and a new center of infection would have been established.

Toadstools or mushrooms appear during early winter about most of the sick and dead trees. These toadstools may continue to come up on some stumps for at least five years. They are light tan color and are found in large clumps. They arise directly from the diseased roots and are the fruiting bodies of the fungus. White spores are found on them in immense numbers but probably these spores do not cause new infections in living trees, although we have repeatedly grown them artifically. They might easily infect a decaying stump.

If we examine carefully a root newly killed by this fungus we see that its bark is somewhat puffed and when cut into is soft and moist. By care we can separate it into layers exposing white plaques of fungus which are soft and felty and tend to radiate out in fan-shaped bodies. The appearance will vary somewhat according to the kind of tree. The odor is a sharp, sweet mushroom odor and not putrid or sour. Precisely such bodies are found in artificial cultures. Sometimes the bark is cracked and fungus bodies pushed out into prominent ridges which are black on the surface but white below. Roots which have been attacked for some time will be found to have the wood with a white decay working in from the surface. After a time the wood becomes very soft and moist and finally almost completely disappears.

Dark brown to black shining root-like structures coming out of the diseased bark and running along its surface are often found. These are the rhizomorphs; they resemble roots but have a different structure, the center being composed of soft white fibers. They give the fungus the power to go several inches from one root to another. When the tip of the rhizomorph comes to a healthy root the very small microscopic threads of which it is composed seem to loosen like the cut end of a rope and the individual threads penetrate into the bark and start a new infection.

Prevention

It is often recommended to take great expense to get out all roots from new land before planting. Evidently the fewer roots left in the soil the less chance there will be of infection. However it is not within the limits of practicability to get out all roots from wooded land. A good practice would be to clear the land, cultivate thoroughly, then keep it several years in alfalfa before planting the orchard. However in view of the scattered nature of infections and the impatience of planters it does not seem worth while to insist on such a program.

Treatment of individual trees may have a certain value but usually will be disappointing and is doubtfully worth while for orchard trees. If the crown of an affected tree is uncovered and by a generous amount of digging all diseased roots are removed or the diseased bark scraped off and the wood treated and the place allowed to dry out well, the remaining roots will grow freely, provided the tree has not been girdled by the fungus. By repeating such treatment and by keeping the crown as dry as practicable it is entirely possible that a tree may be kept alive for many years.

Treatment of Spots

We have insisted that two problems are involved: First, checking the outward advance of the fungus so that new trees will not become affected and second, treatment of area already infected.

Treating the margin of the spot has

Here's What Satisfied Customers Say About "R&W" ORANGE TREES

Read This:

"Exeter, Cal., Nov. 27th, 1914.

"Gentlemen:—

"In 1906 I purchased from you 2160 Washington Navel Orange Trees and planted same on my 20-acre place 1½ miles southeast of Exeter. My orchard has made a remarkably fine growth and the fruit is not only the very finest type of Washington Navel, but my trees have borne regularly and they produced oranges, most of which have been marked as extra fancy.

"The trees came into bearing three years after they were planted, and they have done so remarkably well that it is always a pleasure for me to recommend any of my friends, in case they want trees, to buy Roeding & Wood stock.

"As I have stated before, the quality of my fruit has been the very best, but this season, now that the trees are practically at an age where you might say they are in full bearing, I am not only very proud of my orchard, as there is none better in the country, but I am confident that I will receive returns from the fine crop of golden globes that I am getting that will repay me handsomely for the care that I have given this orchard. **I estimate my crop this season at six to seven thousand packed boxes.**

"Yours very truly,

"(Signed) L. L. THOMAS."

CITRUS Trees —the finest stock ever grown.

We have for this season's planting a splendid assortment of all the leading varieties of oranges, lemons, pomelos, limes, etc., and can fill your orders complete with almost any quantity. Our stock is all grown in the choicest spots of California, under ideal soil and climatic conditions, from buds of select strain—the kind that produces premium fruit.

In addition to citrus trees we also make a specialty of Olives—Manzanillos, Mission, etc. Ask for prices.

Olives

We can supply you with all the leading varieties of deciduous fruits such as apples, pears, peaches, plums, etc., as well as ornamental stock.

Deciduous Fruits

ROEDING'S FREE ADVISORY SERVICE

We offer to every purchaser of our nursery stock a special service to aid in the growing of premium fruit. Our Mr. Roeding has had over 30 years' experience in California horticulture, and you receive the benefit of his advice free when you purchase from us. Write for further details—or ask for our 1915 Illustrated price catalog.

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FIVE YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

been practiced, I understand, in German forests by digging a ditch about the affected area so as to enclose all the fungus. The fungus travels along the roots and a ditch makes a space which it has no way to pass. We have some experiments under way to test this method. Our orchardists object to an open ditch, so we allowed the ditches to be refilled. One spot ditched was in an orange orchard in good mellow soil, trees good and more than ten years old. There were two dead trees and two infected at the root but with the tops still fine. The ditch was made three to three and one-half feet deep, no wider than necessary for digging. It seemed to have cut all the roots. Infected roots could be readily recognized. As finished it was believed that no diseased orange roots crossed outside the ditch. A layer of tarred building paper of good quality was put against one side of the ditch to prevent new roots from crossing back into the diseased area.

After a little more than two years the ditch was reopened. The building paper was worthless for stopping the roots as they grew through it very readily. The rest of the experiment was highly encouraging. In repeated cases a root from which a piece had been cut out could be recognized unmistakably on the two sides of the ditch. The place within the diseased area would be in an advanced condition of decay with the fungus, while the end toward the unaffected trees and outside the diseased area would be entirely unattacked and putting out numerous roots. There could be no reason to doubt that if the ditch had not been made the fungus would surely have followed the root and there would have been no hope of saving the tree. Around this area which included four diseased trees, no less than five good trees were saved from infection. If once opening the ditch will save the sound trees from infection for two years there is no reason why the thing can not be done again in the same place and the spot permanently restrained to its present area.

Several points in the work should be noted. In one case unintentionally a diseased piece of root was thrown back into the ditch. The new roots which had grown out from the healthy side had come in contact with this and were already diseased but this infection had not gone far back toward the good tree. I believe we succeeded in removing all of this infection.

It should be pointed out that many new roots were getting close to the infected areas and would soon have become infected, so that if the ditch is made once and not reopened the trouble will be only slightly delayed and the work will hardly be worth while. Some orange roots which were cut off in working the ditch remained alive in the soil for more than two years and were pushing out growth from the cut end which might have become a leafy shoot. This is an important matter because it shows that a long time must elapse before roots will be entirely decayed in the soil.

Treating Diseased Area

It would not seem to be a difficult matter to find some substance which could be put into the soil and kill everything. Carbon bisulfid is the most promising material thus far suggested. If used properly and in sufficient quantity I feel sure it will do the work. It is simply a matter of studying out the method and counting the cost. I feel rather doutful if it will be possible to kill the fungus and not kill good roots lying in the soil, because the fungus penetrates into the wood and part of it is deeply buried, while the living part of roots is the cambium layer just between the bark and wood. The way carbon bisulfid spreads and works in the soil may be illustrated by one experiment. A row of holes was bored with a small soil auger one foot apart and about 14 inches deep. One ounce of carbon bisulfid was poured into each hole, and it was filled and tamped with the heel at once. This row of holes passed just at the edge of the branches of a good orange tree.

After a little more than two months part of this row of holes was dug out. Roots near the surface of the ground were found dead a little more than a foot on each side of the holes while the deepest roots (less than three feet) were killed nearly three feet

Does It Pay to Raise Apples?

Go to the nearby store, get the prices of first-class apples—

"The Big Red Apple"

the kind grown in the Yucaipa Valley—and figure whether growing the king of fruits is a paying proposition. After doing so write the Redlands & Yucaipa Land Co. and get printed matter explaining fully the best apple, pear and peach land in California. Or come to Redlands and let us take you to Yucaipa and show what we have.

Yucaipa is 2400 to 3000 feet above the sea, eight miles from Redlands. Land is selling at $285 per acre, on easy terms, one share of water stock in a Mutual Water Company goes with each acre. This is the time of year to plant deciduous fruits.

Redlands & Yucaipa Land Co.

DIKE & LOGIE, General Sales Agents

209 Orange Street REDLANDS, CAL.

I Want to Show You This 40 ACRE EQUIPPED FARM

LAND: Level, clean, strong; no brush or stumps; ready for plowing; between two railroads and within 1½ miles of stations on Southern Pacific and Western Pacific. In the Upper Sacramento Valley.
SOIL: Deep San Joaquin loam.
WATER: Unlimited water at 20 to 25 feet.
EQUIPPED: with a plow, a harrow and a cultivator, a pumping plant complete, trees and seed.
SPECIAL: This land is absolutely above all flood from rivers; the titles are clear and guaranteed; there is no bonded indebtedness; there are no reclamation or irrigation assessments. This is clean, strong land without incumbrance of any kind.
THE PRICE is $150.00 per acre with equipment, or $125.00 for the bare land. Terms, ¼ cash, balance 6 equal annual payments, 6%. I want to show you this specially selected piece of land.

from the holes. There was no way to guess how deeply the material was effective but evidently it would be for a good way. Wetting or covering the soil after injecting the carbon bisulfid will probably be more important than the amount used. We have taken a treatment of injecting 1½ ounces at 1½ feet each way as a sort of standard for experimental purposes. I am convinced that the treatment is worthless if the material is injected into dry loose soil. I do not yet have a precise method worked out which can be depended on but there is much hope of getting such a treatment in the future.

Ways of utilizing the infected areas are by planting annual crops or resistant trees if they can be found. Such areas have sometimes been used by well-meaning growers for nurseries. The nursery would probably grow very well so far as could be observed, but it will be clear that such planting is highly undesirable. I have found spring replants badly infected the following fall. Of resistant trees the pear is decidedly the favorite in California and I have no definite data to oppose to this view. However, I understand that the pear is not entirely immune in the states north of us nor east of the Rocky mountains. Black walnut, cherry, apple and fig probably all possess decided resistance. I can only advise caution in replanting diseased areas with supposedly resistant trees. The strain of heavy fruit bearing and occasional bad seasons may reduce resistance in some cases. I would urge at least that a large hole should be dug and the soil not used to fill the hole, but spread out to dry around it and all roots gathered up. The best quality of soil free from pieces of sticks or wood should be used to fill the hole in which to plant the trees. The fine roots I believe are less liable to infection than the larger ones, so that in this way resistant roots will be given the best chance to escape infection.

I cannot close this paper without calling to your attention that there has been suggested, on the basis of experimentation, one definite way, the ditch method, for stopping the spread of oak fungus disease. The work suggested is not unduly difficult nor expensive and should be practicable under some conditions. We hope in the next few years to be able to suggest treatments more adaptable for large trees such as walnuts.

In starting in to treat an oak fungus area, first, make sure that the oak fungus is present and that you can recognize it on the roots. A piece of suspected root may be sent to the university if there is any uncertainty. Next, make a map of the area and locate every tree which has the disease and indicate these on the map. Conditions of the trees should also be indicated. Then the map can be studied and it can be decided exactly what should be done. I advise deliberation. The problem is one which may take years to solve, but if worked at consistently I believe may be solved in time and without extraordinary expense.

As we go to press Prof. Wm. T. Horne sends the following warning:

Small nursery blocks are a legitimate source of income to the fruit raiser, but where set in open spaces in orchards they are in particular danger of armillaria or oak fungus. An open space in an orchard often means that the trees died out with oak fungus.

Armillaria areas in orchards are very common in the best fruit sections but often the fact that the ground is infected is not known to the present owner.

All nursery trees grown in armillaria spots should be condemned because they may establish new spots when set in good land.

Inspection cannot be trusted to discover all attacked trees, because the rhizomorphs may be brushed off and infection remain in the root in an invisible condition.

Everybody should do his best to avoid this misuse of the infected areas of orchards and should help his neighbor to avoid it also.

Anyone insisting on planting nursery in armillaria land should be reported to the local quarantine officer.

TOADSTOOLS OF THE OAK ROOT FUNGUS ARMILLARIA MELLEA. THESE SPECIMENS WERE ABOUT EIGHT INCHES TALL.

PRICE OF OLIVES

Calling attention to the answer to an olive query in a recent issue of the Cultivator Mr. Henry S. Gane of Santa Barbara writes that this season's olives have brought practically nothing. Many producers are complaining that there is absolutely no market and we regret that what Mr. Gane writes is practically true, for the buyers appear to be afraid of touching the olive at any price this year.

In addition, Mr. J. C. Ramsdale, who has had many years' experience with olives in California, writes:

"Just now there is a craze for olive planting and I feel there ought to be a pretty thorough investigation before any extensive acreage is set out. I was out of the game for two seasons and I find that there is not the demand and consequently not the price that there was two years ago. With the large number of trees set out in the past four years, some of which are just coming into bearing, it is a question whether or not olives will pay as well as they have for the past few years.

"This year a lot of growers could not dispose of their fruit at any price. I know of one firm of packers which bought olives at $25 a ton delivered at their plant, payment to be made inside a year. This was oil olives but I bought pickling olives at $60.00. I know a large grocery firm which is selling olives in gallon cans at 50 cents. It costs 25 cents to pack so this leaves 25 cents for the packer's profit and the grower. It seems to me it is very doubtful if the prices will go back to $150.00 for olives. I know your paper works in the interest of the grower, so I am giving my ideas which you can take for what you think they are worth. Personally I have always advocated planting olives if the grower is willing to give them the proper care. But while I am in the industry and expect to stay I believe there will be disappointment unless the grower knows that he has a market.

Deciduous Fruits

REMEDIES FOR "DAMPING OFF"

COMMERCIAL sulphuric acid has been found by the United States department of agriculture to be an effective remedy for the loss of pine and spruce seedlings from "damping off." It is quite common for the soft tissues of these young seedlings to decay so rapidly soon after sprouting that they disappear sometimes before the nurseryman knows that there is anything the matter with them. So common indeed is loss from this source that many nurserymen import their seedling stock from Europe. This however is not only troublesome but dangerous. The white pine blister rust has already been introduced into this country in this way and continued importations of seedlings are certain to result in the establishment in the United States of other foreign pests.

For this reason the department attaches much importance to the recent investigations of possible disinfecting agents which will rid the soil of the parasitic fungi which cause "damping off." Of these agents the most satisfactory for commercial use in the majority of cases has been found to be sulphuric acid. Treatment with this acid not only reduces losses from "damping off" but increases germination.

The number of seedlings in treated beds may be from one and one-quarter to ten or even twenty times as great as in untreated beds, depending on how serious the disease is in the untreated beds. At most nurseries the treatment also decreases the number of weeds and causes the pines to make a better growth during their first season. At one nursery jack-pine seedlings have grown three times as high in acid-treated beds as in untreated beds.

The treatment is not expensive, for commercial sulphuric acid can be purchased in quantity at very low rates. At one nursery where careful accounts were kept it was found that the entire cost of the treatment, including labor, materials, and extra waterings, was less than $5.00 per thousand square feet of bed. On the other hand the saving in the cost of weeding alone, which the treatment made possible, amounted to $5.30 per thousand square feet.

The sulphuric acid is dissolved in water and applied to the beds with a paraffin-coated sprinkler just after the seed is sown and covered. From one-eighth to three-eighths of a fluid ounce of acid should be used per square foot of bed, dissolved in enough water to make one and one-half or two pints of solution. At some nurseries it is also necessary to water the beds once or twice daily during the germination period to prevent chemical injury to the seedlings. Individual conditions must determine for each nursery whether or not this frequent watering is necessary and exactly how much acid should be used.

Sulphuric acid is now in regular use on the seed beds at nurseries in four Western states, Nebraska, Kansas, Colorado and New Mexico. Considerable quantities of carbonates, however, are contained in some soils in these states, their presence being indicated by vigorous effervescence or bubbling when a strong solution of acid is applied. Where this is the case sulphuric acid is not likely to be effective. In one nursery in Kansas zinc chloride and copper sulphate have been found satisfactory substitutes when used in the same way as sulphuric acid. For zinc chloride one-half ounce avoirdupois is used per square foot, and for copper sulphate three-eighths of an ounce or less. The chloride is less apt to injure seedlings but is more expensive than the copper sulphate. Despite its greater cost, however, it is possible that the zinc chloride may be preferred both to sulphuric acid and to copper sulphate even on soils which do not contain carbonate.

APPLE HOLDINGS AND THE MARKET

Although dealers generally report that the holiday demand for apples did not prove to be as expected, the result of investigations conducted by the office of markets of the United States department of agriculture would indicate that the movement of cold storage apples during the month of December was satisfactory under the conditions. Three hundred and six firms reported for January 1, of which number 231 reported for December 1. If the average condition for this number of storages situated in all parts of the country is a criterion, approximately 13 per cent of the total cold storage holdings December 1 were marketed prior to January 1. The decrease in barrel holdings was much greater than for boxes. After analyzing the movement it is seen that during the month of December 16 per cent of barreled apples were moved as against 4.2 per cent of boxes.

The percentage of movement in December for box apples was small, but it is to be remembered that large quantities of this pack are held in common storage in the box-apple producing areas and that box apples placed in cold storage under conditions existing this year were held largely for the later winter markets.

Remembering that cold storage apples met with heavy competition in the distribution of common storage stock, it is apparent that the movement of barreled apples in December, as indicated by the above recapitulation, was liberal. It being understood that common storage apples are chiefly marketed prior to January 1 and that the entire common storage holdings as a rule are out of the way by February 1, those interested in the cold storage deal should not be discouraged in so far as the future is concerned. This does not mean that high prices can be expected, but rather that the fruit ought to move gradually to meet the heavy demand which has been created during the past few months as a result of bountiful supply and low prices. With common storage apples out of the way, the demand for cold storage stock will increase proportionately.

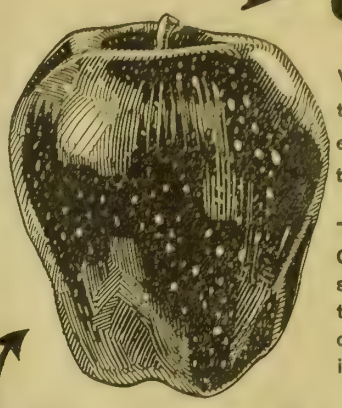
The cold storage holdings of apples are admittedly large, and a regular, vigorous movement throughout the remainder of the season may be necessary to prevent disaster in the spring. Growers and dealers are urged neither to dump their holdings nor to stand for arbitrarily high prices. Panicky selling usually means grief, but all concerned should seek to move cold storage apples gradually and with such rapidity as the market allows, so that the deal may be wound up in relatively good shape.

VALUE OF STRAW AS FERTILIZER

A large amount of straw is shipped from a county in Missouri to a nearby paper and strawboard factory. This straw brings the farmer about 50 cents per ton. A county agent recently found a pile of about 1,000 tons ready for shipment. He computes that as a fertilizer this straw is worth $2.50 per ton in addition to its value as a means of adding organic matter to the soil. He is making a campaign of the county in an attempt to show the inadvisability of the farmers selling their straw and urging its more extensive use as bedding in stables and feed lots. Straw used as a top dressing on fall wheat has been found to practically insure a good stand of clover on lands where clover is otherwise grown with great difficulty.

The Madera County farm bureau suggests the advisability of holding a Madera County fair on the 1st and 2nd of October.

Roeding's True TREES
TAKE THE RISK OUT OF PLANTING



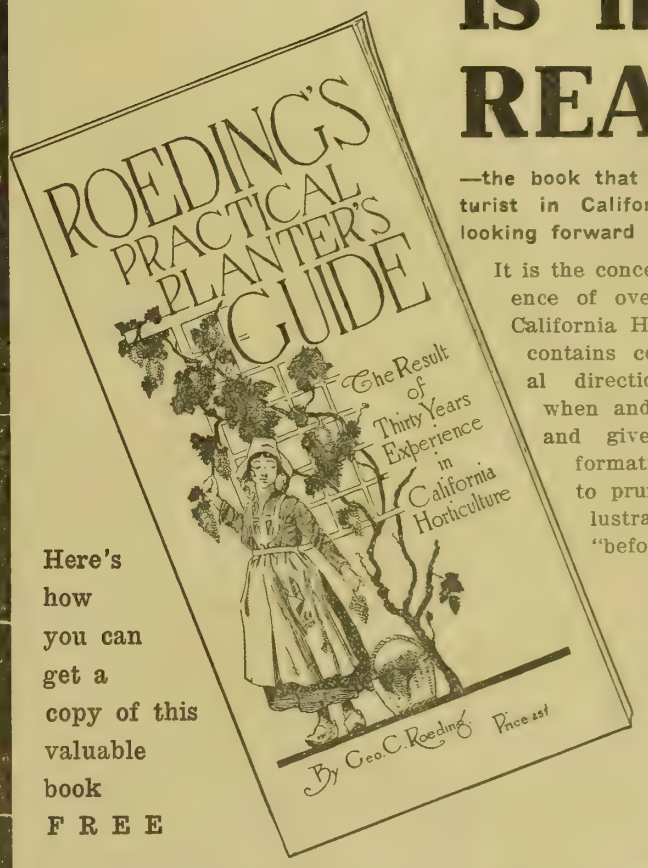
When you buy from us you get the finest trees that time, money, brains and experience can develop—trees that will grow true to name and produce profitable results.

Two thousand acres in the very heart of California's most fertile valley, used exclusively for the growing of Roeding true fruit trees, vines, shrubs and plants, as well as ornamental stock. Millions of trees grown in a scientific way.

We Grow Everything that Grows

It makes no difference what you may have in mind to plant—whether it is citrus or deciduous fruit or ornamental trees, vines, plants, etc.—we can supply you in almost any quantity and with the most magnificent stock ever grown in the State of California. If you haven't already received a copy of our 1915 illustrated price catalogue, we will be glad to send you a copy free on request.

Our New Book is now READY



—the book that every horticulturist in California has been looking forward to for years.

It is the concentrated experience of over 30 years in California Horticulture and contains complete cultural directions. It tells when and how to plant and gives detailed information in regard to pruning, with illustrations showing "before" and "after." It is a complete text book of 48 pages. Price 25c postpaid.

Here's how you can get a copy of this valuable book FREE

Send us a list of whatever you intend to plant this season—unless you have already placed your order. Tell us what varieties you expect to plant and how many of each and give us an opportunity to figure with you on your requirements. We have set aside a limited quantity of these booklets for prospective Fancher Creek customers and will be glad to send you a copy free of charge if you will send us a list of what you expect to plant this season. The supply is limited. Write us now.

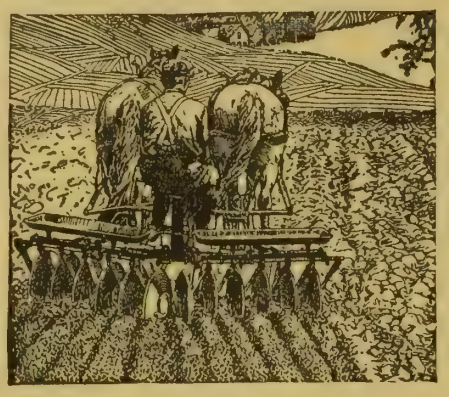
International Harvester Tillage Implements



EVERY year we learn more about the proper preparation of our seed beds—every year as a result the profits from farms have grown greater. Nowadays, careful farmers would as soon do without binders as without adequate tillage implements—such as they find in the I H C line.

International Harvester disk harrows, for instance, work wonders when properly used—aerating the soil, pulverizing it, breaking up clods of dirt, forming a moisture-holding granular mulch of dirt.

When you know disk harrows fully you will know that proper harrow use means the purchase of an implement from the I H C line. The frame is strong and well-braced, to stand the strains of disking sod before plowing, and for work in rough, hard ground. The chilled bearings with large bearing surfaces are practically dust-proof. The set levers keep the gangs to their work at even depth.

The full International Harvester line includes disk, peg and spring tooth, and smoothing harrows, drills, seeders and cultivators. The line contains the best in tillage implements. See the I H C local dealer, or write us for interesting catalogues.

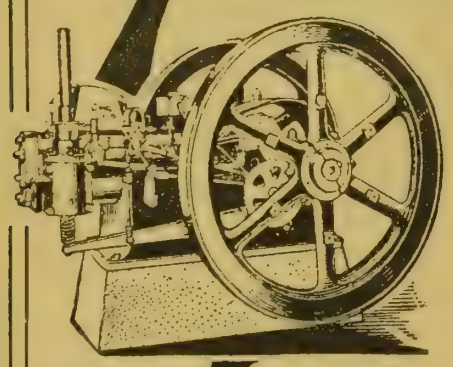
STEADY AND QUIET ECONOMICAL OF FUEL

Western Gas Engines consuming special gas oil at 2⅝c per gallon, cost one third of a cent per HP. per hour to operate.

All our years of engine building experience are concentrated in the new model WESTERN GAS ENGINES. We have left out every unnecessary part. Wearing parts could not be made better. We have built leng life and supreme satisfaction to engine users in every WESTERN GAS ENGINE we are turning out. Compare these engines point for point with any on the market, then decide for yourself. We build them every part alike and standardized, on the very finest automatic machinery, with the highest class of skilled labor, under the supervision of master mechanics. WESTERN GAS ENGINES are built in one of the finest equipped factories in the country by master engine builders. The many orders we are now receiving proves that the WESTERN GAS ENGINE is the ideally all-round, all-purpose engine for ranch work.



Before you buy an engine send for our catalogue—free to all who write for a copy.

General Agriculture

FOUNDATION STONES FOR SUCCESS IN AGRICULTURE

CONTINUING the series published in the Cultivator of February 4. In these brief summaries different experts of the college of agriculture of the University of California have set forth the basic principles of their various specialties.

FACTORS OF GOOD FARMING

By John W. Gilmore, Professor of Agronomy

Soil preparation, tillage, drainage, a good supply of organic matter in the soil, and applications of mineral fertilizers, including lime, enhance the yield and the quality of the crops.

Crops and animals bred for high production and quality lessen the cost per unit of production.

Good crops and animals generally make for better men; they increase man's appreciation and broaden his sympathies.

Rotation of crops tends to promote the crop producing power of the soil, to equalize labor distribution, to destroy pests, and to balance animal and crop production.

A legume should be grown upon land at least one year in every four.

The judicious use of mineral fertilizers combined with manures (both green and yard) will, under proper culture and tillage methods, maintain the crop producing power of the soil.

With crop producing power maintained, a proper balance between crops produced for sale and for feed, and animals fed, brings the largest returns per labor unit.

Man and horse labor should be employed constantly throughout the year.

A proper balance should be maintained in each type of farming between building, implement and working live stock equipment and land area.

Location and receptivity of the market are factors to be considered in planning and executing a cropping system.

An adequate system of cost accounting reveals the amounts and sources of income. Maintenance of crop producing power and maximum yields and quality per unit of labor expended should be the aim rather than these maxima per unit of area.

FEEDING FARM ANIMALS

By F. W. Woll, Professor of Animal Nutrition

Feeding stuffs contain three groups of components of special importance in the feeding of farm animals: 1, protein; 2, carbohydrates and fat, and 3, mineral matter.

Protein is required by the animal for making muscle and body substance of similar composition.

Carbohydrates and fat supply energy for the production of body heat and fat and for work.

Mineral matter is necessary for the building of the bone structure and for supplying ash materials in milk and other animal products.

Farm animals should receive rations containing all three groups of feed components, but the proportions of each will vary according to the kind and age of animals kept, and the character and cost of the available feeds.

Young or growing animals, cows, sheep, and poultry, require a larger proportion of protein in their feed than full grown, fattening, or working animals.

The feed requirements of the animal body for maintenance must be met before production can begin; liberal rations containing a considerable proportion of feed available for production, therefore, yield the largest and the most profitable returns.

A portion of the feed of heavy producing animals should be in concentrated form.

The more important protein feeds in this state are alfalfa, clover, peas, beans, and various oil meals.

The more important carbohydrate or starchy feeds are wild, mixed, or grain hay, cereal grains, sorghums, and dried beet pulp. The mill feeds and many other factory by-products contain a medium amount of protein.

Succulent feeds are beneficial to milk secretion.

Alfalfa is best supplemented by corn silage and grain feeds, or both, in feeding dairy cows or fattening steers.

Grain hay is best supplemented by a mixture of mill feeds, oil meals, and similar protein feeds.

THE USE OF FERTILIZERS

By John S. Burd, Professor of Agricultural Chemistry

Fertilization should always be accompanied by proper cultivation of the soil.

Fertilizers may be used to advantage: On soils which are naturally deficient in one or more of the commercially important plantfoods (nitrogen, potash, phosphoric acid). When the soil has been grown to a single type of crop for many years. When growing high priced crops. When labor is the principal factor in the cost of production.

The kind of fertilizers to apply: The one which contains the kind of plantfood in which the soil is deficient. The one which experience has shown to produce the best results with the given crop.

The form of plantfood to apply: The one which experience has shown to be best adapted to the crop (soluble phosphoric acid rather than bone phosphate for turnips, for example). The one adapted to the type of soil. The one adapted to the stage of growth of the crop.

In the application of fertilizers: Easily soluble substances may be applied as a top dressing. Less soluble substances should be worked into the soil. More than one installment may be frequently used to advantage, depending on its nature and that of the soil and crop.

FORESTRY

By Walter Mulford, Professor of Forestry

Forestry, man's dare of the forest, means the management of permanent crops of timber and the best means of utilizing those crops.

Large forests on the mountains mean more water in the irrigation ditches.

Small forests in the valleys mean local supplies of fuel and posts, and often mean more moisture in the fields because of checking hot winds.

On the mountain and in the valley the forest should be a wholesome recreation ground.

Nature's methods of maintaining forests are wasteful and shiftless; without help from man nature is unable to meet the demands which are made upon the forest by civilized man.

The forest crop will respond to man's care by greatly increased quantity and much higher quality of the product.

The control of forest fires is the first step in forestry.

Forest fires can be controlled when public sentiment insists upon it.

Leaf mulch on the forest soil serves as the fertilizer, the cultivator, and irrigator of the forest; without a leaf mulch, the forest suffers severely.

Proper thinning increases the rate of growth of timber.

The axe and saw are frequently the only planting tools needed in the forest; skillful cutting of the ripe timber is often all that is necessary for starting a desirable young crop.

The forest must pay for itself, either directly or indirectly; forestry is a business proposition.

DESIGN IN LANDSCAPE GARDENING

By John W. Gregg, Professor of Landscape Gardening and Floriculture

Simplicity is the prime element in pure beauty and in landscape design is the opposite of extravagance. In-

tricacy is the soul of landscape and is the opposite of blankness. Convenience produces a feeling of satisfaction by making every interesting feature comfortably accessible. Compactness economizes space and labor, creates the appearance of order, and renders each feature a part of the combined whole. Seclusion produces a feeling of ownership and privacy, and is in accord with good taste. Snugness involves shelter, protection, warmth, shade, and a play of sun and shadow. Unity adapts in a pleasing way the several parts of a design to the whole. Blending artistically distributes plants and groups and other features of a design so as to do away with an extreme continuity of lines. Symmetry preserves balance of parts. Graduation permits a gentle transition of parts into others without conspicuous breaks or marked interference with harmony. Richness produces a feeling and appearance of refinement by tasteful selection of all elements of design. Variety adds refined spice, freshness, and power to a design. Contrast seeks to distinguish the more important episodes and detached accessories without destroying harmony. Finish demands good plant forms, cleanliness, and completeness. Order produces a regularity and presents the appearance of substantialness, and denotes the production of a master mind.

ENTOMOLOGY

By C. W. Woodworth, Professor of Entomology

Standard insecticides are best. Secret remedies are usually fraudulent. New remedies against insects are frequently humbugs. Much of the money spent in treating insects is wasted. Losses in insecticide work are chiefly due to unwise treatments. Attempts to eradicate a pest always involve a money loss. Time of treatment is important for peach worm, codling moth, and many minor insects. High-pressure spraying is chiefly valuable because of the increased quantity applied. Fumigation is much more efficient than spraying in dense foliage like that of the orange. The question of the amount of chemicals to use per tree is more important in fumigation than in spraying. Treatments are not made unprofitable by a neighbor's insects. Most of the profit in treating insects is made in controlling half a dozen insects. Houseflies and mosquitoes are not necessary evils, they can be suppressed. A few hives of bees are profitable on nearly every ranch. The use of frame hives always pays.

MODERN CITY AND TOWN PLANNING

By John W. Gregg, Professor of Landscape Gardening and Floriculture in the University of California

Conserves human energy and protects life, especially child life.

Fosters economy and introduces a scientific reality into a definite scheme of orderly development.

Results in a material saving in the cost of all public improvements.

Correlates various activities.

Encourages commercial activities.

Preserves historic buildings and sites.

Prevents mistakes which make inevitable other mistakes which cannot be corrected.

Provides for a well-developed system of streets.

Regulates the location and grouping of public buildings.

Reserves space throughout the city for playgrounds, parks, public gardens, and athletic areas.

Provides for the democratizing movements of social centers.

Regulates and locates industrial and residential districts.

Provides areas for beautiful homes, depopulates the slums, and provides comfortable environment for the poor.

Provides for proper housing facilities.

Limits the height of buildings and the proportions of lot areas to be built on.

Establishes zones or districts to be developed in different ways.

Regulates the plotting of suburban areas in harmony with the general plan.

Controls the development of privately owned public utilites and the location of works.

Saves time, motion, health, happiness, children, and a great deal of waste and haste.

It's just another of the ways that Studebaker MAKES SURE. You see, steels are so important in the building of a car that Studebaker takes no chances. When designing the car, before it ever gets as far as the shops, Studebaker metallurgists study the duties of *each* of the parts, and decide just what kind of steel is BEST to use.

Then the steels are made just as they specify. And they come to the plant and are tested—time after time. And THEN, when the drop forgings are completed, they go thro' not one, but a whole series of HEAT-TREATING operations, like the one pictured here, that give them that tough, tensile, LONG-lasting quality that Studebaker Cars are famous for.

It's expensive, to be sure, but it gets into this FOUR quality that gives the car extra safety and makes replacements rarely necessary. It makes the car BETTER. And you know, as your fathers knew, how eager Studebaker is to go to any expense that will make Studebaker products BETTER.

So when you come to see this FOUR at your local Studebaker dealer's please STUDY its whole construction, and see how Studebaker, with its close knowledge of what the farmer needs, has built this car to give day-by-day SERVICE and convenience on *country* roads.

Study its balance, its alignment that makes the car EASIER riding and so EASY to drive that it answers to the touch of *two fingers* on the wheel. Study that long-stroke, high-speed motor with its over-abundance of POWER.

Get the dealer to tell you of the National Service organization that Studebaker has built up, so that wherever you drive you can always get Studebaker Service. Study every little detail—and be CRITICAL.

Consider how much you get for $985—and then, decide if this isn't the car *you* want

—because it's a

Small Fruits Vegetables

BLACKBERRY PLANTING

UNDER good management an average yield of 2,300 quarts of blackberries per acre can be expected, according to a recent publication issued by the United States department of agriculture. Where the soil is very deep and rich and the best moisture conditions are found this may be increased to 5,000 quarts, and certain varieties on the Pacific slope have even given 7,000 quarts an acre. The last census showed that approximately 50,000 acres were devoted to blackberry plantations in the United States. This acreage is distributed over practically the entire country.

In selecting a site for a blackberry plantation the most important considerations are the moisture of the soil and the accessibility to a market. The blackberry is a tender fruit, the keeping qualities of which are seriously affected by jarring over rough roads. It is moreover essential that the berries should be placed on the market as quickly as possible after they are picked if they are to command a good price. The best land is a deep, fine, sandy loam with a large supply of humus and abundant moisture at the ripening season. On the other hand the plants are often killed if water stands on the plantation during the winter.

The year before the establishment of the blackberry plantation the land should be planted with a cultivated crop. This will help to destroy the cutworms and other insects injurious to the young plants. The soil should be plowed to a depth of about nine inches in the spring and a thorough harrowing should be given the whole field before the plants are set.

During the first summer some inter-crop may be grown between the rows, which will greatly reduce the cost of the berry field that year. This should be one that requires constant cultivation and at the same time one whose growth will not be large enough to shade the blackberry plants. Such truck crops as cabbage and potatoes are excellent for the purpose, while corn and small grains should be avoided. By the second summer the plants will be large enough to occupy all the space and an inter-crop will not be possible.

In both summers cultivation should begin early in the spring and be continued at intervals of from one to two weeks throughout the season in order to provide a dust mulch for the retention of moisture and to keep down suckers and weeds. Suckers are apt to spring up from the roots at various distances from the parent plant, especially when the roots are cut. Digging up these suckers is a favorite way of securing new plants, but this practice, interferes, of course, with the yield of the berries.

Blackberry roots live for many years, but the canes—excepting two varieties—bear only in their second year. After the fruiting season, therefore, they should be cut out and burned. The one-year-old canes may usually be left to themselves throughout the winter. Not more than three or four new canes should be left to each plant, however, and the others should be thinned out at the same time that the canes which have fruited are thinned. In some cases it will also be desirable to train the plants in order to facilitate cultivation as well as to prevent them being damaged by winter snows. A wire trellis may then become a profitable investment. The simplest form of such trellis consists of a single wire attached to posts set at intervals of from 15 to 30 feet in each row of plants. The canes are tied to this wire about two and one-half feet above the ground. Another method is to nail cross pieces to the posts and stretch two wires from the ends of these cross pieces, which form a support for the blackberry canes on each side. Varieties that grow somewhat like grape vine require a much higher trellis with two wires; one about five and one about three feet from the ground.

One hundred and forty different varieties of blackberries are now recognized, divided into three classes—the hardy, the half hardy and the tender. The hardy variety should be able to withstand a temperature of 30 degrees Fahrenheit as well as the sudden changes of temperature in the Western states. The half hardy class is more susceptible both to cold and

to change, and the tender variety can only grow where mild winters prevail. More detailed information in regard to blackberry culture is contained in Farmers' Bulletin No. 643, which has just been published by the United States department of agriculture.

BETTER POTATOES

Mr. E. H. Grubb, a large Colorado potato grower, while making a friendly call at the Cultivator office recently, when asked about his hybridizing and producing new potatoes, said that was something in which he had never engaged. He simply took the best potato he could find and selected from it until he had secured a strong growing, productive strain of potatoes. He had preferred the Peachblow and took up that potato when it was supposed to be almost entirely "run out." He has built up a strain of stock which is in demand the world over. The town of Carbondale, which he has made famous as a potato growing center, has a population of a little over 300 people, but the little valley of which it is the center, and which has a total length of only about ten miles and a width of less than two, is noted as one of the greatest potato producing sections.

Mr. Grubb selects his seed, not from the bin but from the row, and the individual potato must not only be perfect in size and shape but it must come from a hill which showed great productiveness. The old time method of using nubbins or weaklings for the next year's crop has passed and Mr. Grubb's method of work has taken its place.

GOOSEBERRIES

Mr. E. C. Hall, a Monterey County subscriber, writes regarding gooseberries which have done exceptionally well in that section. Gooseberries are not considered adapted to the warm interior valleys but it is very probable that farther north and near the Coast sections they may be grown very profitably. Mr. Hall says:

"There are several kinds that do well in some of the coast counties; namely, Downing, Houghton, Red Jacket, of American varieties, and May Duke, an English sort. Red Jacket and May Duke are my choice for home use on account of their fine flavor, containing less acid than some others. The gooseberry is fine for pies, for a tart jam unexcelled, and for sauce just try a dish with good rich milk. The bushes do not need much pruning for two or three years, all they need is clean cultivation and plenty of fertilizer."

SAUER KRAUT

One method for preserving cabbage for use during the winter when fresh vegetables are scarce is to make it up into sauer kraut. This German dish may be eaten raw, fried, boiled with pork with onions added, or with wienerwurst sausage and browned in oven, or cooked with spareribs.

The department's assistant in girls' demonstration work, who is endeavoring to aid the young women in rural communities to get the most good out of their vegetable products, recommends the following recipe for preserving cabbage in this manner:

Sauer kraut or "crout."—Use one to three quarts salt to 20 gallons shredded slaw. Remove outside and hard core of cabbage. Shred finely. Line the keg with the larger leaves on the bottom and sides as you fill it. Put in a three-inch layer of shredded cabbage and sprinkle with four or five tablespoons salt. Repeat this process, lining with the large leaves. Pound it all down well until the cask is full and covered with the brine. Cover with the large leaves and a board cover to fit inside the cask. Weight this cover down with heavy weight so it will keep the cover level. It is necessary that all the cabbage be covered with brine at all times. Keep in a cool, dry cellar three weeks to a month. Remove the scum and see that the kraut is well covered with juice. When the weather is warm the kraut will cure in 16 to 18 days, when it is ready for use or for canning.

HERCULES POWDERS

Tested for Uniformity

IF you have handled a shotgun much, and have studied the question of shotgun powders, you know that uniform quality in the powder you use is absolutely essential for consistent shooting either in the field or at the traps.

You get this uniformity when you shoot shells loaded with

Infallible
Smokeless Shotgun Powder

Day after day, in the ballistic house of the Hercules Powder Company, at Kenvil, N. J., Infallible is tested for uniformity in velocity, uniformity in pattern, and uniformity in recoil and breech pressure.

As a result every grain of Infallible is just like every other grain. You know that there will be no variation in your shooting due to a variation in powder.

Infallible Smokeless Shotgun Powder gives unusually high velocity, even patterns, and light recoil. Furthermore, it is absolutely unaffected by water. If you have ever had a box of shells fall overboard or have shot in a pouring rain you know what this means.

The next time you buy shells ask for those loaded with Infallible. It is supplied in all standard makes.

If you are a trapshooter write us for a book called "Trapshooting." It may give you some pointers even if you are an old hand at the game.

NATIONAL ORANGE SHOW

(Continued from Page 227)

A. Moulton, certainly had a task in reaching a decision as to the prize winners. These judges have nothing to do with the feature or community exhibits. At this writing the names of the judges of feature exhibits are not announced.

The first tent, upon entering, is given over entirely to citrus fruits and feature exhibits. In the center of this mammoth tent, however, is the pool where the diving girls draw the crowd. The management insist that the vaudeville stunt is necessary in order to make gate receipts. It certainly aided in this case for at the time of the diving attraction the crowd massed around the pool was immense.

Next to this tent is the one containing orchard and other appliances, manufactured products of the citrus, fertilizers, spray materials, etc. In this tent was observed the newly constructed fumigating machine. A similar machine has been manufactured and is working very successfully in many Southern California orchards, though some have felt that it had certain faults and they have been working to produce a more perfect machine if possible. The machine consists of a large drum or container within which are three chambers. In one of these is a solution of cyanide of sodium, in another a solution of sulphuric acid and water, with a third chamber for bringing proper proportions of these mixtures together. There is an automatic mixing appliance by which the operator simply moves the gauge to the proper point according to the size of the tree and with one push of the lever throws the two fluids together, and the result is instantaneous generation of the gas. This amounts almost to an explosion, and the entire volume of the gas is instantly forced into the tent. The machine then passes to another tent, throws the supply tube underneath, the two movements complete the work with this tree and the machine passes on along the entire length of the orchard. The machine does away with the weighing and measuring of cyanide and acid and probably will lessen the number of men required or perhaps rather increase speed of the fumigating operation; it has been tried out in orchard practice and except for a few faults, which have been discovered and are now being remedied in the construction of another machine, it is almost perfect in operation.

A detailed description of the various orchard appliances on exhibit would be impossible in this article.

Next to the appliance tent is the amusement tent, containing dancing floor, vaudeville stunts, etc.

Chairman Haven of the publicity committee has said regarding the modern day citrus fair: "Citrus fruit shows were held in San Bernardino and other Southern California cities 25 to 30 years ago, but the exhibitions of those days were of a very different type from their counterpart of the twentieth century and would now appear as very tame entertainment for the horde of visitors who annually throng the gates of the National Orange Show."

The first of these National Orange Shows was held in February of 1911. As a rule, most unfavorable weather has been given and this has prevented the complete financial success which was desired. However, San Bernardino has pluckily stuck to the proposition and pulled for its fair regardless of weather conditions, and we trust it will continue to do so.

AWARDS

SWEEPSTAKES. Best 24 boxes Washington Navels—1, Lindsay B. of T.; 2, Etiwanda Citrus Fruit Assoc; 3, Victoria Avenue Citrus Assoc.

Best general display oranges, 48 boxes or more—1, Etiwanda Citrus Fruit Assoc.; 2, Lindsay B. of T.; 3, Cucamonga Citrus Fruit Growers' Assoc.

Best general display lemons, 48 boxes or more—1, Etiwanda Citrus Fruit Assoc.; 2, Riverside Orange Co.; 3, Corona C. of C.

Best eight boxes Washington navels—1, Pachappa Hill Groves; 2, Lindsay B. of T.; 3, Etiwanda Citrus Fruit Assoc.

Best eight boxes of sweets—1, Etiwanda Citrus Fruit Assoc.

Best four boxes Washington navels—1, Sierra Vista Packing Assoc; 2, Lindsay B. of T.; 3, Victoria Avenue Citrus Assoc.

Best four boxes sweets—1, Etiwanda Citrus Fruit Assoc; 2, Lindsay B. of T.; 3, Fontana Citrus Assoc.

Best four boxes St. Michael's—1, Fontana Citrus Assoc; 2, Cucamonga Citrus Fruit Growers' Assoc.

Best four boxes of seedlings—1, Lindsay B. of T.; 2, Fontana Citrus Assoc.; 3, Pachappa Hill Groves.

Best four boxes tangerines—1, Alta Cresta Groves; 2, Victoria Avenue Citrus Assoc.; 3, Cucamonga Citrus Fruit Growers' Assoc.

Best four boxes Valencias—1, Whittier Chamber of Commerce; 2, Lindsay B. of T.; 3, Charles Cowles, Lindsay.

Best four boxes Malta Bloods—1, Pachappa Hill Groves; 2, Riverside Heights Orange Assoc; 3, Cucamonga Citrus Fruit Growers' Assoc.

Best four boxes Thompson Improved Navels — 1, Sierra Vista Packing Assoc.; 2, Alta Cresta Groves; 3, Arthur Brown, Riverside.

Best four boxes Ruby Bloods—1, Mr. Cole, Lindsay; 2, Lindsay B. of T.; 3, Mrs. Cora B. Ocheltree, Riverside.

SWEEPSTAKES. Best 24 boxes of lemons—1, C. D. Hubbard Fruit Co., Carpinteria; 2, Etiwanda Citrus Fruit Assoc.; 3, Whittier Citrus Assoc.

Best four boxes lemons—1, C. D. Hubbard Fruit Co.; 2, Etiwanda Citrus Assoc.; 3, East Highlands Assoc.

Best four boxes seedless grapefruit—1, George Sparks, Lindsay; 2, Victoria Avenue Citrus Assoc.; 3, Lindsay B. of T.

Best four boxes seedling grapefruit—1, Lindsay B. of T.; 2, Fontana Citrus Assoc.; 3, Placentia C. of C.

Best commercial pack one box of Washington navel oranges—1, Lindsay B. of T.; 2, Victoria Avenue Citrus Assoc.; 3, Alta Cresta Groves.

Best commercial pack one box lemons—1, Riverside Orange Co.; 2, Corona C. of C.; 3, Bloomington Fruit Assoc.

Plate or table displays

Washington Navels — 1, Etiwanda Citrus Fruit Assoc.; 2, Victoria Avenue Citrus Fruit Assoc.; 3, Pachappa Hill Groves.

Best cluster oranges—1, Del Rosa C. of C.; 2, California Portland Cement Co.

Best cluster grapefruit—1, Placentia C. of C.; 2, Etiwanda Citrus Fruit

HERCULES POWDERS

Farming with the Help of Dynamite

ON the modern farm, and by progressive farmers, dynamite is used to serve a multitude of purposes. Whenever it is properly used it increases efficiency, increases crops, decreases labor, and decreases expense. It has proven its ability to do these things in almost every field of agricultural labor.

HERCULES DYNAMITE

is used extensively for subsoiling, tree planting, stump and rock removal, ditch running, the blasting of cisterns, and other work of a similar nature.

Probably the results produced by sub-soiling and in tree planting are the most interesting because they are the most remarkable. Very often the crop yield from a sub-soiled field will more than double that from the same field before sub-soiling was done—an increase of 100 per cent. This has happened with corn, wheat, rye, hay and other crops. When trees are planted in a dynamited instead of a spade dug hole they develop more rapidly, are stronger and bear more heavily.

Sub-soiling gives new life to the ground. It breaks up the hard sub-soil thereby improving drainage and giving the crop new and untouched plant food.

You should write for the book, "Progressive Cultivation." It tells how, when and why to use dynamite on the farm. To many, it has proved an eye opener and a money saver.

MORE SANITARY CONDITIONS ON FARM

In an address before sanitary engineers Mr. Hyde R. Russell, speaking on rural sanitation, its interest and value to residents of cities, puts the farmer as a class in a not very desirable light before his city audience. He compared the great efforts on the part of the city to protect its food and water supply and to secure for itself the best of sanitary conditions with the usual slipshod methods of the ordinary Eastern farmer. He spoke of the auto party often wishing for fresh air and a drink of pure water and a bit of farm cooking taking a trip to the country and stopping at some resort or possibly a farmhouse and being served with polluted drinking water and possibly milk and food which would never pass inspection in the city market, this because of the carelessness of the individual farmer or resort keeper. This carelessness is most evident in the arrangement and location of outhouses. Referring to one resort he says:

"I will relate in connection with the summer vacation an interesting experience and investigation of last summer. I stopped at one of the best and highest class summer resorts, in other words, a hotel noted for its sanitary protection. It was found that the drinking water used in this hotel was brought from many miles away on account of its unquestioned purity. The milk supplied was beyond question, and in fact is seemed to the ordinary observer that every modern protection was taken to quard the health of the guests. In spite of all this protection a very dangerous practice was in use. It was found that the radishes, lettuce and celery, before being placed on the table, were washed in water drawn from a surface well, anl only 50 feet from this well, outhouse privies were in actual operation, being used by the employees. A condition like this needs no further comment."

Many other instances are given more from the city man's standpoint than from the farmer's, and intended as a warning to city people visiting the country. The writer makes appeal for more attention to sanitation on the farms, especially in this matter of outbuildings. Screening and preventing the access of flies in addition to protection of wells are features referred to by the speaker, and above all he would have them as convenient as possible for this reason.

"Is is recognized, I believe, that most human ills are due in a great measure to auto-intoxication, which is self-poisoning. If we accept this theory we have to go farther and accept the possibility of auto-infection. If we wish to protect against auto-reinfection it is very essential that we to the best of our ability strive in every way to insist on proper methods for the disposal of human waste."

NAMES OF CONGRESSMEN

We have request for names and addresses of representatives and senators in the national congress. Of course, these may all be addressed at the present time at Washington. Those serving during the present session are: Representatives William Kent, John E. Raker, Charles F. Curry, Julius Kahn, J. I. Nolan, Jos. R. Knowland, D. S. Church, Everis A. Hayes, C. W. Bell, William D. Stephens, William Kettner, and Senators George C. Perkins and John D. Works.

All the above will return to the next congress excepting that Representative C. W. Bell will be succeeded by Chas. H. Randall of Highland Park, and Joseph R. Knowland will be succeeded by J. A. Elston. Senator James D. Phelan, Phelan Building, San Francisco, will take the place of Senator George C. Perkins.

Have confidence in yourself; get the idea impressed into your cranium that you can do as well as your competitor, and then prove it.—Albright.

THE POINT OF VIEW FOR FARM RECORD KEEPING

The whole subject of farm accounting is a complex one and has many different aspects, depending on the point of view. In the application of the principles of farm accounting to the needs of a particular case, a better perspective and better results will be obtained by attacking the problem seemingly backward, but really forward, by first determining the results desired. A house builder would be considered unwise to buy his material first and rely upon this to give him the house he wants; yet this would be no more foolish in principle than to start a system of record keeping by buying the books and forms without knowing in advance the points concerning the business which these records are desired to bring out. Having determined these, the next step is to decide upon a system of record keeping that will emphasize these points.—J. S. Ball.

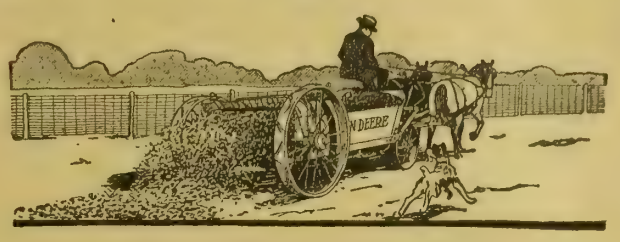
A CLEVER PRECAUTION

Mike—Begorra, an' I had to go through the woods the other night where Casey was murthered last year an' that they say is haunted, an', bedad, I walked backward the whole way.

Pat—An' what for wuz ye after doin' that?

Mike—Faith, man, so that I could see if anything wuz comin' up behind me.—Tit-Bits.

John Deere Implements



John Deere Spreader

The Spreader with the Beater on the Axle

The beater—the business part of the spreader—and all its driving parts, is mounted on the rear axle. This is a patented feature. You can't get it on any other spreader. The beater on the axle means there are no clutches to give trouble, less than half the parts heretofore used on the simplest spreader, big drive wheels and a low down spreader without stub axles. Only hip high to the top.

Write for more facts. Also ask for "Farm Manures and Fertilizers", a valuable textbook you can get free.

John Deere Wheel Plows

With Quick Detachable Shares
Unscrew One Nut—That's All

John Deere Wheel Plows, known the country over as "Quality Plows" are now fitted with John Deere Quick Detachable Shares—an exclusive John Deere feature.

Here are some advantages of these shares:

1. No trouble to change shares.
2. Eighty per cent of time saved.
3. No danger of damaging share.
4. Share is drawn up closer.
5. Share is stronger—not weakened by bolt holes.
6. Resharpened or sprung shares can be drawn into place—no drift punch necessary.
7. No unequal strain on share.
8. No danger of injury to hands in taking share off.

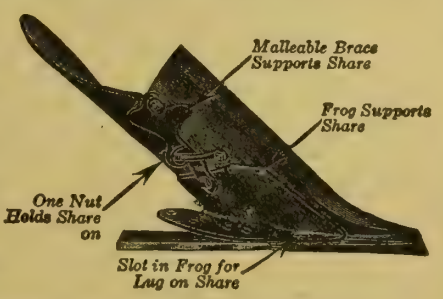
We have beautifully illustrated booklets on the following plows with John Deere Quick Detachable Shares:

New Deere Sulky and Gang (High Lift Frame Plows)

John Deere Stag Sulky and Gang (Low Lift Frameless Plows)

John Deere Two-Way Sulky (Side Hill or Irrigated Land)

John Deere Engine Gangs (For Traction Engines)



Mention the booklet above that you want and we will send it to you free.

R. & V. Gasolene Engines

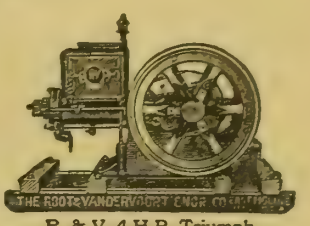
New Triumph One Horse Engine. Just the engine for light work about house and barn, such as running washing machine, pumping water and operating other small machines. Saves every member of the family work and worry.

A reliable, efficient, low priced but high grade engine. Easy to start, smooth running, requires no attention when in operation, economical in use of fuel and perfectly safe in and around buildings. All working parts are back of the fly wheel out of the way—a neat outfit in every respect.

R. & V. Triumph Engines for All Farm Machinery

The R. & V. Triumph line of engines is also made in 2, 4, 6, 8, 10, 12 and 16 H.P. sizes, stationary and portable. Every farm can use one or more of these engines to advantage.

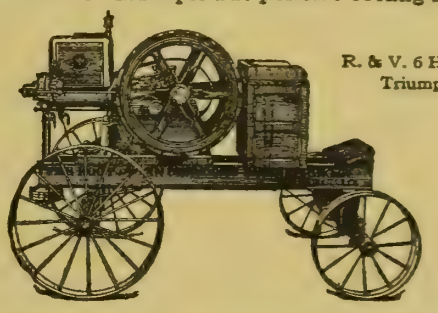
They are dependable gasolene engines—always develop rated horse power.



R. & V. 4 H.P. Triumph

An extra ring over the piston pin prevents scoring and ruining cylinder. This is an unusual precaution for lengthening the life of a gasolene engine. This careful attention to details is followed in constructing every part of the R. & V. Triumph.

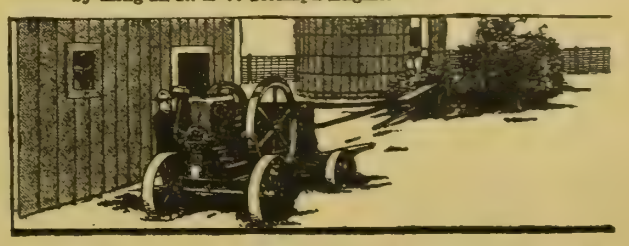
Hopper Cooled. A simple but positive cooling system.



R. & V. 6 H. P. Triumph

The gasolene tank for every R. & V. Triumph Engine is most conveniently and safely located—on practically all of the stationary engines it is in the sub-base.

Write for free booklet "Letting Gasolene Do It." This book tells how you can save time every day in the week by using an R. & V. Triumph Engine.



Better Farm Implements and How to Use Them FREE BOOK

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, discs harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X-111.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

REPORT YOUR INCOME

Farmers whose incomes are in excess of $3,000 per year must make report to the internal revenue officials prior to March 1.

WANTED

The Cultivator has request for copies of the Cultivator of January 22 and February 19, both in the year 1914. We will appreciate it if subscribers who are not particular about saving them for their own files will forward us these copies. For this we will advance the subscription of the one sending three months.

BREAKING RECORDS

Some time ago the poultry world was gratified and astonished at the production of Lady Show-You with her 281 eggs in 365 days. A few weeks ago an Oregon hen went her five better and made a record of 286. Now comes a Massachusetts biddy with a claim of 309. What the country wants, however, is not exceptional hens but exceptional averages. Our present average the country over is too close to the 100 mark to make egg production profitable at present feed prices.

ORANGES IN BASKETS

A number of Florida citrus growers are trying out the shipment of oranges in bushel and half-bushel baskets. The idea is to have fruit delivered in an original package of more acceptable size. We recall well that a similar experiment was tried in California some ten or a dozen years ago. Several cars packed with bushel baskets were forwarded but not receiving the attention expected in the retail markets the effort was soon discontinued.

MONEY FOR AGRICULTURE

The national congress has appropriated the greatest sum ever for the support of the department of agriculture. The total, exclusive of the permanent annual appropriation, is $22,627,712. This is an increase of nearly $33,000,000 over last year's, and nearly $2,000,000 over the estimates submitted by the department. The excess is because of the special appropriations of $235,000 for hog cholera work and $2,500,000 for the campaign against the foot and mouth disease. Another special appropriation was called for by the campaign against the citrus canker.

STILL SPREADING

A new outbreak of the foot and mouth disease has been reported from the stockyards of nine different states of the country. The most westerly of these are Indianapolis and Louisville. Fortunately this outbreak has so far been confined to the stockyards, and all the stock was ready for slaughter; it did not involve stockers and feeders as was the case with the Chicago outbreak. The department of agriculture is taking a strong hand and it is to be hoped will quickly exterminate this disease.

MORE FARM ADVISERS

Heretofore nine counties have been supplied with farm advisers or demonstrators by the state university. Now come two more, Glenn and Solano, and there are others—a dozen or more—on the waiting list expecting as early attention as possible from the university, which is working with limited funds, but it is probable that the funds are no more limited than the supply of qualified advisers. We are glad that the greater part of the work now being done by the advisers is proving most satisfactory to the agricultural interests of the counties in which they have been working.

FEDERAL AID

There will be one satisfaction about federal aid in the good road building campaign. Any funds supplied from this source means that taxation falls equally on the city beneficiary and the rural. At the beginning of the good roads campaign those loudest and longest in their cry for good roads were those who paid nothing or but very little for their construction and upkeep. It has, however, been shown that the business of the city is equally as dependent on good roads as is that of the country, and city people are becoming more content with bearing their proportion of the cost. Now if our government will aid in spreading the gospel of good roads and, better, finance good roads, all will be benefited. We believe there is no farmer who does not realize the money value of getting his crops to market with as little injury and as great expedition as possible.

SUGAR UP

Sugar is again being advanced, having gone from $4.95 early in January to $6.00 on February 10. It is to be hoped that this will call attention to the fact that America should be producing more of its own sugar. Unfortunately the tendency seems to be the other way, and while we are consuming over a million dollars worth of sugar every day in the year, we are importing the greater proportion of it. America has always been a great nation for exporting foodstuffs, but it has neglected the sugar industry which would employ hundreds of thousands of workmen, keep busy hundreds of factories, requiring tens of thousands of acres to supply beets. Let us produce more sugar instead of importing over 200,000 tons a month from the one little island of Cuba.

STATE ASSOCIATION

A state agricultural association was started on its way to regular organization on Washington's birthday at the exposition grounds in San Francisco. This movement was first launched at the Los Angeles meeting of the State Fruit Growers' Association last fall when a committee was appointed to call together representatives of all lines of agricultural work at this meeting in San Francisco. There was a most encouraging response. While the attendance was not large, representatives of all branches of productive industry were present. A committee was appointed to outline a plan of action and report at a mass convention to be held on the grounds of the Panama-Pacific in San Francisco, probably sometime in March.

GOVERNMENT SHIPS

Hon. Wm. D. Stephens of California has introduced a sensible bill providing for government ownership of vessels which shall be used for transports in time of war and for merchant marine in time of peace. A glance over the bill convinces us that it is a most excellent provision and would supply that which the Pacific Coast is now short on, that is, sufficient vessels to carry our produce to Eastern shores. Regarding the purpose of the bill Representative Stephens writes:

"The purpose of the bill is to 'round out' the navy by providing transports and hospital ships for war time, and to establish government-owned water transportation lines through the canal between the principal ports on the Pacific Coast and the principal ports on the Atlantic (including Gulf) Coast of the United States; also between Pacific and Atlantic ports of the United States and Mexico, Central America, South America, and such other foreign ports as from time to time the president may designate.

"If the army and navy could add such vessels as each can spare in time of peace to the merchant ships now operated by the Panama Railroad Company, that company, or any other authorized to do so, could regulate rates and supply much of the demand for ships in the trade between our Eastern and Western coasts. It could also pioneer the way to South America and to other foreign ports. There are enough government owned ships, if at once made available, to meet all water transportation undertakings advisable for the government to begin in the next 12 months.

"The bill creates no condition which might involve us in war with any nation. It makes no mention of purchase. It authorizes construction only. This bill will keep the $30,000,000 at home, and give work, wages and business to American workingmen, American merchants and American capital."

I wish to congratulate you for publishing the best agricultural magazine in the state and one of the finest in the world. I certainly do enjoy reading it from one end to the other.

Now have been getting your publication for some seven or eight years, but quite a number of the copies are missing from my collection, which I regret very much as I would like to bind each year's copies for future reference. Therefore, I wish to know if you can supply me with back numbers for about five years.—George T. Wilson, Rivera.

Agricultural Notes

The exportation of rabbit skins from Australia now exceeds in value over $3,000,000 annually.

The United States purchased more than half the hides shipped from Argentina during 1914. England was the next largest purchaser.

The Japanese government is encouraging breeding of sheep in Japan. There is a constantly growing demand in that country for woolen textiles, imports of wool now being made to the yearly value of $7,000,000.

The wheat crop of Uruguay has this year suffered serious damage through excessive rains. This makes the second successive poor crop, last year's having been damaged in the same way.

The Rocky Mountain national park in Colorado is to be established, by virtue of a law which has just been passed by congress. This will be the seventh large national park and will have an area of 230,000 acres. The six national parks already established are said to have had in the past year about 250,000 visitors.

The United States government collier Caesar brought 500 tons of government exhibits to the exposition grounds at San Francisco on January 13. The display constitutes the largest exhibit ever made by a government in an exposition. It will occupy more than 192,000 square feet, and will represent every department of the service.

Authorization has been secured from the secretary of agriculture to graze on the national forests of California, for the season of 1915, 212,280 cattle and horses, 505,750 sheep and goats, and 7,950 swine. The national forests are accommodating more live stock each year as better methods of handling are brought about and new unutilized areas are brought into use through trail construction, water development and other means.

A swine disease known locally as "purple fever" has recently made its appearance in County Mayo and County Sligo in Ireland. The chief veterinary inspector of the Irish department of agriculture and technical instruction believes it to be a form of swine erysipelas, and states that veterinarians have thus far developed no specific remedy, although vaccine treatment has been attempted in a similar affliction among English swine.

The war in Europe has been preventing exports from India of the seed of the Vateria indica tree, known also as the piney tallow tree, which produces a substance known as vegetable tallow, which formerly found its chief market in Antwerp. This tallow is said to be useful in the manufacture of candles and of soaps and to bring almost the same price as good animal tallow. It is said that after refining it is edible and suitable for use in making confectionery.

Agricultural News Notes of the Pacific Coast

Northern California

Vacaville, Solano County, reports plum cots in bloom February 7.

Fifty Russian families have located at Ravendale in Lassen County.

On January 25 direct telephone service was opened between San Francisco and New York.

The Long Valley center of the Placer County farm bureau had 75 members at its last meeting.

The farmers' union of Gridley, Butte County, held a banquet at Odd Fellows Hall, Saturday, February 6.

Price of grain bags made at San Quentin penitentiary will be six cents per bag to farmers until April 1.

The Placer County farm bureau organized units at Penryn, Loomis, Newcastle and Rosedale last week.

Various county dedication days of the Panama-Pacific are scheduled for the first two months after the opening.

Siskiyou County's Panama-Pacific Exposition commission has secured a fine lot of movies showing industries of that county.

The Yolo County farm bureau is particularly interested in cow testing and several local associations have been organized.

Cold versus heated brooders was the subject discussed at the last meeting of the Castro Valley center of the Alameda County farm bureau.

The great Panama-Pacific opened Saturday at San Francisco. The most spectacular feature of the opening day was the great foot parade of citizens.

Prof. F. T. Bioletti of the viticultural department of the state university delivered a lecture on vine pruning at Cloverdale the evening of February 12.

The monthly report of the county librarian of Yolo County shows new branches opened at the county hospital, Guinda Indian school and Jefferson school district.

Live Oak, Sutter County, is sowing great quantities of California poppy seeds in all uncultivated spots. Women's clubs are taking the lead in this beautifying movement.

Lands in Colusa County and along the Sacramento River near the junction with the Feather have been flooded during the last two weeks and much damage was done to farming and transportation interests.

"Carrying coals to Newcastle" is modernized by "Shipping California rice to New Orleans." The General Hubbard sails from San Francisco with 200 tons of Butte County grown rice consigned to New Orleans dealers.

Property owners of Sutter County living along the old Live Oak drainage ditch are considering favorably a proposition to organize an irrigation district under the Wright law, using the drainage ditch as an irrigation canal.

Napa County's exhibit at the Panama-Pacific is built of solid granite and weighs several hundred tons. It is a three-span bridge in actual size, 87 feet in length. After the exposition it will be rebuilt in Napa County for service.

Central California

The Visalia Cooperative Creamery paid out $23,500 for cream checks in January.

The Wasco district of Kern County reports that 2000 acres will be planted to rice.

The Visalia Cooperative Poultry Association is building additional warehouse room.

The Oakdale section of Stanislaus County will plant several hundred acres to rice.

Geo. C. Roeding and H. C. Wuerth have been named publicity committee for Fresno's Raisin Day, April 30.

The Tulare Cooperative Creamery Company has elected Wm. Swall president and W. D. Cartmill, manager.

Plans are being worked out for the construction of a boulevard from Porterville to Lindsay through Strathmore.

Members of the Porterville Poultry and Pet Stock Association are planning a banquet to be held early in March.

The San Joaquin Valley Counties' Association plans to distribute much literature at its exhibits at the Panama-Pacific.

Hollister, San Benito County, is making large shipments of hay, 10 and 12 carloads having gone out daily for a number of weeks.

It is proposed to form a Turlock Growers' Association, with capital stock of $75,000, to sell produce and buy supplies for members.

The annual meeting of the trustees of the Associated Raisin Company was held in Fresno February 10. Directors were reelected, as was Manager James Madison.

The raisin growers of Clovis, Fresno County, met February 17 with President Madison of the Associated Raisin Company to hear report of the business of the Associated.

The Kerman Cured Fruit Association held a conference with General Manager Ellis of the California Cured Fruit Exchange at the Vinland school house Friday evening, February 5.

President Jastro of the American National Live Stock Association has issued a call for the 18th annual convention of the association at Memorial Auditorium, San Francisco, March 24, 25 and 26.

Twenty-one students of the Visalia high school have enrolled in a hog raising contest. The one realizing the most profit in a specified time will be awarded a trip with the experimental train of the state university through Eastern states.

The Kings County Poultry, Pigeon and Pet Stock Association has been reorganized with the following officers: President, W. F. Bernstein, vice-president, Ed R. Bradley; secretary, B. B. Price; treasurer, B. D. Scott; superintendent, Ed R. Bradley.

The Turlock branch of the Stanislaus County farm bureau is establishing a demonstration and experiment farm on six acres of land just outside the Turlock city limits. Experiments the present season will be made with corn and sorghum and various fertilizers.

Southern California

Santee, San Diego County, is assured of a new cannery.

The governor has been asked to fix March 20 as Orange Day.

Beet planting in Orange County was stopped by recent heavy rains.

San Dimas, Los Angeles County, expects a record crop of lemons.

April 22 has been chosen as Imperial County day at the Panama-Pacific Exposition.

The Claremont Pomological club held its last meeting in Glendora at the woman's club house.

The bright day last Sunday brought thousands of visitors to the National Orange Show at San Bernardino.

Plans are under way for the erection of a large citrus fruit packing house near the old mission at San Fernando.

D. M. Utter, state president of the Farmers' Educational and Cooperative Union, addressed the last meeting of the union at Arroyo Grande, San Luis Obispo County.

The San Diego chamber of commerce is proposing to work with local chambers throughout the county to secure water development.

At the recent meeting of tht Claremont Pomological Club at Glendora Professor McBeath of the Riverside citrus experiment station spoke on the use of fertilizers.

The Orange County Vegetable Growers' Association has received word from a carload of rhubarb shipped to Chicago three weeks ago that sold for $2.00 per crate.

The Panama California Exposition at San Diego has set aside March 20 as farm bureau day. On that day the annual meeting of the San Diego farm bureau will be held in Exposition Auditorium.

Forest Supervisor Charlton has placed about 100 men at work on trails in the Angeles forest. These men will be put to work in the Arroyo Seco, Tejunga, San Gabriel and Pacoima Canyons.

James A. Armstrong, who has been county farm adviser of San Diego County, goes to Maricopa County, Arizona, to take up the same work there March 1. H. A. Weinland has been named to succeed him.

The farm bureau of Ventura County, in the few months of its existence, has started experiments in bud selection and seed selection of the lima bean, and has conducted a campaign to destroy ground squirrels.

The Imperial Valley Irrigation district has acquired all rights and title of the Southern Pacific Company in the irrigation system in Imperial Valley, both on the American and Mexican sides of the boundary line. The purchase price was $2,152,500.

The Hog Raisers' Association of Imperial Valley has been asking for federal aid in its hog cholera campaign. The plan of the association is to gain the services of two veterinarians, representatives of the United States bureau of animal industry, who will vaccinate hogs in the county in an effort to stamp out cholera.

The Coast

The Baker County poultry show closed last week at Baker, Oregon.

The apple crop of the Hood River district last fall reached 1200 cars.

Montana reports range stock in good condition. Snowfalls have been light.

It is reported that numbers of cattle are again crossing the line from Mexico.

Cochise County, Arizona, is discussing the possibility of securing a county farm adviser.

The Southwestern Stockmen's Association will hold a convention at El Paso, Texas, March 2-4.

The department of the interior is advertising for cattle for use on Indian reservations in Arizona.

The Stockmen's Association of Navajo and Apache Counties, Arizona, will hold its next meeting April 6 at Holbrook.

The cattlemen of New Mexico hope to have the 1916 convention of the Panhandle Cattlemen's Association at Albuquerque.

Utah reports more cattle on the range now than last year. The range is poor because of lack of rains to bring up the grass.

The Arizona State Poultry Association met February 13 in Phoenix. The cold storage problem was the principal topic discussed.

The Arizona Good Roads Association has asked the legislature for a $400,000 appropriation to be expended upon the highways of the state.

The city marshal of Yuma has this sign posted on the streets: "Vagrants, the city needs your help. If you want to work stay; if not, the going is good."

A bill has been introduced into the Arizona legislature requiring that all laborers in hazardous employment shall be able to understand the English language.

Five thousand condemned Chinese eggs were destroyed in a crematory at Spokane, making a total of 45,000 destroyed by state food inspectors in the last few days.

A bill has been introduced into the Utah legislature designed to create a state board of animal industry and abolishing the offices of state sheep commissioner and state veterinarian.

The total output of apples for the four states of Oregon, Washington, Montana and Idaho last fall reached 15,000 cars. The majority of this was marketed through the North Pacific Fruit Distributors.

Tax assessors of Mojave County, Arizona, are holding for taxes cattle owned by Utah stockmen. The owners claimed to have paid taxes on these cattle in Utah but the Arizona officials claim the cattle graze the entire year in Arizona.

The Oregon legislature has approved the Forbes bill providing a system for managing the Tumalo irrigation project in Central Oregon. It also provides for the appointment by the state land board of a project manager. The price of water rights under this measure is fixed at $40 per acre and for the land at $250.

WHAT DOES A SILO COST?

AN IDEAL GREEN FEED SILO will pay for itself the first year. That being the case it will cost you nothing.

AS A MATTER OF FACT, THE COST of a silo is really a secondary consideration, because if you are keeping dairy cows or raising stock for the market, there is no investment which you can make which will pay you better returns than an IDEAL GREEN FEED SILO.

A GOOD SILO IS A NECESSARY PART of the dairy equipment of every cow owner or stock raiser who wants to realize a reasonable profit from his herd, and if the matter of cost has been standing in your way, please remember that it is really not a question of whether you can afford to erect a silo, but whether you can afford to do without one.

IF YOU HAVE NO SILO a little investigation will be sure to convince you that you ought to purchase an IDEAL GREEN FEED SILO right away, and be prepared to save your first cutting of alfalfa. Then plant corn to fill it again this fall.

Write for new Silo Catalog for full information.

HOG CHOLERA PROBLEMS

Written for California Cultivator
By Sacramento Valley Contributor

JUST what to do under certain conditions which arise in the hog cholera situation many hog raisers would like to know. Like other emergencies that come up on the farm the only answer is for the individual concerned to obtain all of the best information on the subject, then make the decision according to the merits of his own particular case.

Let us suppose, for instance, that you have a herd of good, healthy hogs, and that as far as having plenty of feed, sanitary conditions and all of the other things that go to make a profitable hog growing enterprise, you are all right.

Then some miles away from you there is an outbreak of cholera. The chances that your hogs may have it brought to them by birds, dogs or passing wagons is remote, yet it exists. You can keep the hogs in fields away from the county roads and away from streams, yet the danger of infection is there just the same.

There are several things you can do. First, you could kill all dogs and birds that come on the place, disinfect everything about the hog yards and keep up this disinfection, keep all visitors away from the hog pens and trust to this care to keep disease away from your hogs.

Second, you could treat them with hog cholera serum alone, at a cost of about $1.00 per head for a mixed bunch of pigs and older hogs. This would make them immune for one to three months.

Or you can treat them with hog cholera virus and serum at the same time and produce immunity from the disease for one to three years—at a cost of something over $1.00 per head, probably $1.50.

Hog cholera serum is blood from an immune hog. When the serum is injected into a well hog it produces immunity from cholera for a limited time. Hog cholera virus is the blood from a hog sick with cholera. It contains living germs of hog cholera and can produce the disease. Blood from an immune hog has the ability to counteract the effect of the hog cholera virus so that in the "virus-serum" theatment the disease is produced and cured, thereby causing immunity.

But if the serum is not effective and the virus is, or any mistake is made in administering the virus, hog cholera may be produced where it did not previously exist. Hence the danger and the fact that some hesitate about immunizing their hogs. There have been some serums and viruses on the market that were not good. One firm in the East spread foot and mouth disease through hog cholera serum.

All the statistics, however, prove beyond question that good serum and viruses properly administered are effective in a large per cent of cases.

So that the man with the well herd may wait—if he chooses—until one or two of his hogs contract the disease, then treat with serum and render them safe from attack, or, using double treatment, immunize the perfectly well ones at this or a later time, and any suspected of having the disease with the serum only.

Every hog owner in a cholera district should get in touch with the veterinary department of the agricultural college of the University of California at Berkeley, secure all of the bulletins on the subject and plan his own course of action according to his best judgment.

Dryness in the hog house should be insured by thorough drainage and freedom from dust by sprinkling with water. Although sunlight is necessary, an excess of it will cause trouble in very hot weather.

THE ANGORA GOAT MOHAIR INDUSTRY

By Alva L. McDonald, Secretary American Angora Goat Breeders' Association

The first Angoras were imported into this country in 1849. The then sultan of Turkey desiring to pay a compliment to the work done by Dr. Davis, an American who had been sent to Turkey to educate the Turks in the raising of cotton, presented Dr. Davis with nine of the choicest Angoras in his domain. This action marks the beginning of the Angora industry in the United States.

Their value as brush cleaners and weed destroyers was at once recognized and for some time they were used only for that purpose. Later it developed that their fleece had a market value owing to the fact that the peculiar texture of their fleece was essential for certain fabrics, and then it was that Angora stockmen began to grow them for their mohair.

The word "mohair" is the technical name for the fleece of the Angora goat. According to George Fayette Thomson, M. S., author of the work entitled "Angora Goat Raising and Milch Goats," the word comes to us through the old French "mohere" from the Arabic "mukhayyar," meaning mohair cloth. It differs from the wool of the sheep in that it does not have the felting properties of the latter. The felting property of wool is due to the presence of scales or epithelia which cover the fibre in much the same manner that scales cover fish. It is the felting property of wool which distinguishes it principally from other animal fibres. Mohair is a hair proper, being devoid of scales, and so it is not successfully used alone in felt goods.

The fleece upon the goat is pure white; it is exceedingly lustrous and grows to an average length of ten inches annually. It hangs in beautiful wavy curls, or ringlets, from all parts of the body, if the animal is of the best breeding. The average annual production per head of mohair is about three pounds.

It will be noted that Mr. Thomson states, "The average annual production per head of mohair is about three pounds." However, it is gratifying to learn that American intelligence has succeeded in increasing this average amount, and it is safe to say that now the average clip is three and one-half pounds, while there are hundreds of breeders of Angoras in the United States who have bands which will average five and six pounds or even seven pounds per head.

As a conservative estimate the average price for mohair is around 30 cents per pound, therefore the average yearly clip per head should be from $1.00 to $1.50. There are thousands of bands of Angoras in the United States which will double and triple this. There is one mill in the East which annually turns out mohair goods to the value of from 10 to 12 million dollars. This is only one mill, and there are some 10 or 12 mills engaged almost exclusively in the manufacture of mohair goods.

Angora raising can be carried on by two classes of farmers and stock growers. The first is the small farmer who has some brushy waste lands on his farm which are an utter loss to him, places where grass does not grow. Consequently such lands are of no value for his cows nor his sheep, brush and weeds having taken possession. It is here that the Angora will prove his worth. His natural bent is to browse, while peculiar as it may seem he prefers weeds to grass. Therefore a small farmer can well afford to keep a few Angoras if for no other purpose than to clean up these waste places. Their value in this would be worth their keep, but in addition to this they will yield a clip of mohair worth at least $1.00 per

head, but more likely worth $1.50.

The second class is the owners of large tracts of waste lands who can utilize Angoras by putting them on the foothills and mountainous country found in nearly every state in the Union. Their natural tendency to browse and their adaptability to mountainous or steep and rocky country opens an avenue for using tracts for which heretofore no use has been found.

At the present time Texas leads in the number of Angora goats in the United States. New Mexico and Arizona come next, with the Northwest closely following, with every indication that the Northwest will in the course of time lead owing to the preponderance of evergreen browse.

While there has been a marked increase in the production of mohair in the United States, American mills annually import approximately 2,500,000 pounds, so there is no danger for many years to come of an overproduction.

The industry is well organized. First is the American Angora Goat Breeders' Association, with headquarters at Kansas City, Missouri, while the resident secretary's office is in Portland, Oregon. Then there is the National Mohair Growers' Association, with headquarters at Paluxy, Texas. This association was organized for the purpose of selling the annual clip and numbers approximately 1,000 members who are mohair growers. Next is the Northwest Angora Goat Association, Portland, Oregon, with practically every mohair grower in the Northwest as a member. Through the last two named associations the price of mohair has been maintained at a satisfactory schedule.

HOG RAISING ON A GRAIN RANCH

By A. M. Henry
President California Swine Breeders' Association.

In our pride of production of fruits, garden truck, etc., we forget that not many years ago we were making a living in California by means that were then equally as sure and are even now fully as sure in some localities as the production of the above named products. I refer to the raising of grain in connection with stock. Probably the most profitable adjunct of the grain ranch is the hog, be he Poland China, Berkshire, O. I. C., or any other breed that develops in such a way as to give good returns for the feed consumed. One person favors one breed, another some other breed, and some a mixture of breeds. Whatever my ideas are in the matter, it is not my object in this article to champion any certain breed, but to encourage the man who is trying to raise hogs in connection with a grain ranch.

Many of the smaller farmers today find it absolutely necessary to do some of the ordinary work connected with the raising of grain because of the impossibility of obtaining the kind of help that is necessary where stock is to be used as the motive power in the cultivation of the land or where gasoline is the power. It is also difficult to find the person who can use the necessary judgment to make it profitable for a man to hire him to care for the stock being raised on the ranch. Here is where the hog steps in and helps out the grain farmer. To the poor grain farmer who is struggling along and being criticized by some of his alfalfa raising neighbors and sympathized with by others, perhaps, I may be able to offer a ray of hope or even encourage him so much that in his exhilaration he will look over the green fields of his neighbors and wonder where they will sell all the hay or where in California stock will be found to eat it.

The grain farmer will soon have his wheat or grain harvested and will then turn the hogs into the stubble field to grow fat and make pork that sells at an average price of about eight cents per pound on foot, while the alfalfa grower will continue to cut hay during all the fall and add to the overproduction already on hand.

The grain farmers' sows, will, during the month of September, hunt se-

The Supremacy of the De Laval Cream Separator

Supreme in Skimming Efficiency

Over 35 years of experience and thousands of tests and contests the world over have demonstrated the De Laval to be the only thoroughly clean skimming cream separator, under all the varying actual use conditions, favorable as well as unfavorable.

Supreme in Construction

This applies to every part of the machine—to the bowl, the driving mechanism, the frame and the tinware. The De Laval patent protected Split-Wing Tubular Shaft Feeding Device makes possible greater capacity, cleaner skimming and a heavier cream than can be secured with any other machine.

Supreme in Durability

The De Laval is substantially built. The driving mechanism is perfectly oiled and the bowl runs at slow speed, all of which are conducive to durability and the long life of the machine. While the life of other cream separators averages from three to five years, a De Laval will last from fifteen to twenty years.

Supreme in Improvements

This has been the greatest factor in De Laval success. Not a year goes by but what some improvement is made in De Laval machines. Some of the best engineers in America and Europe are constantly experimenting and testing new devices and methods, and those which stand the test are adopted.

Supreme in Service

With its worldwide organization and with agents and representatives in almost every locality where cows are milked, no stone is left unturned by the De Laval Company to insure that every De Laval user shall get the very best and the greatest possible service from his machine.

Supreme in Satisfaction

De Laval users are satisfied users, not only when the machine is new, but during the many years of its use.

Supreme in Sales

Because they are supreme in efficiency, construction, durability, improvements, service and satisfaction, more De Laval Cream Separators are sold every year than all other makes combined.

Order your De Laval now and let it begin saving cream for you right away. Remember, that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below.

Healthy
Cows Are Profitable

The health and contentment of your dairy cows has a very decided bearing on the quantity and quality of the milk production. Poor milkers are not backward by accident; there is nearly always a reason to be found in the cow's physical condition. Cows are like human beings—they get run down and need medical treatment to restore sluggish organs to proper working condition.

KOW-KURE is the cow medicine that is used in hundreds of the best dairies in the land. A judicious use of this old and valuable remedy will effectually prevent such common cow ailments as Abortion, Retained Afterbirth, Barrenness, Milk Fever, Scouring and Lost Appetite. Where any of these ills have crept into the herd, KOW-KURE is a most reliable treatment.

You should have KOW-KURE on hand constantly. Sold in 50c & $1.00 packages by feed dealers and druggists.

cluded places near the running stream or the artificial watering place and there gather the necessary straw to make a good bed, farrow, and often raise more pigs to the litter than they will under the most approved methods when closely confined. In fact, it seems that an old sow just naturally abhors close attention and watchful care during this process of nature. These pigs grow up during the fall totally uncared for except such attention as they get from the dam, and by the time the December rains come they are weaned from the mother and weigh from 25 to 40 pounds. This seems small but when we consider that the expense of producing this growth has been only what the stubble would have brought if sold for feed, which would probably not be over 50 cents per acre, and that the pigs are just as strong and healthy as it is possible for pigs to be, it would certainly look good to most people.

The nights are cold now and the pigs are sleeping at a straw stack prepared for the purpose and are getting varieties of feed. The grains that have laid in dusty exposed places have sprouted and are sending up succulent sprouts that the pigs like and for which they rustle, while the single grains and sometimes whole heads that have laid in the protection of clods or bunches of straw are nearly as hard as during the summer. As the season advances and the rains come more abundantly, the grass grows larger and the grains sprout more and more until finally, by this gradual process of nature, the pigs' feed is changed from hard to soft with no sudden shock which might stunt the pigs' growth.

During this time the pig has rustled for his living and as this is necessary to the best development of a pig, he is just as hardy and healthy as it is possible for a pig to be. From now until haying time the pigs live on the growing grain of the cultivated field and also on the natural grass that grows so luxuriantly in California, and which is just as good a feed and probably better than alfalfa, because there are so many varieties of it that the pig gets a better balanced ration than if eating alfalfa alone.

For later feed the farmer should have some very late sown grain which is green and juicy at the time when the early grain and natural grasses are getting too near ripe to be good hog feed. By the time this late grain is getting too ripe, the early grain is getting entirely ripe and the pigs are then turned into a field sown for the purpose and allowed to hog down the grain and grow just as fast as nature provides for them to grow under such favorable conditions. By the time this field is fed off, the regular grain fields are harvested and the pigs are then turned into them and continue to grow rapidly until October or November, when they weigh from 200 to 250 pounds at 13 or 14 months of age.

The only expensive feed they have had during their lives was the grain they hogged down and their growth during this time has been so rapid that the barley or whatever grain it was, brought more per acre than if it had been harvested, sacked and sold on the regular market.

The writer has raised hogs this way himself and has seen it done many times by others and knows whereof he speaks. While I am now raising purebreds, selling all of them for breeding stock, I can see where the man who is raising for the market today on a grain ranch can probably boast as much over his profits as anyone.

The man who raises hogs on the more concentrated foods has to be a man of good judgment and splendid business ability or his feed will be too expensive, his hogs will be overfed, they will often not breed, be subject to disease, and a number of other things that often occur to lessen his profits. The man with the grain farm who has followed something like the system above described may avoid many of the troubles just mentioned and while his hogs may not weigh what those do that are forced to early maturity, the expense of raising has been so slight that his profits are apt to be very satisfactory.

ALL FAIR RECORDS BROKEN

On the opening day at the Panama-Pacific 216,077 people passed through the gates. This breaks the record for first day admissions at any world's fair. At the great Chicago fair in 1893 the opening day saw 137,557 people inside the grounds. On opening day at the St. Louis fair the attendance was 176,453.

Someone has figured out that each one of the visitors to the grounds of the Panama-Pacific spent $2.19 the first day. This also beats all former records, for at St. Louis the amount spent per capita the first day was $1.57 and at Chicago $1.29.

On the second day of the San Francisco exposition 85,000 people visited the grounds.

Novels are sweets. All people with healthy literary appetites love them—almost all women; a vast number of clear, hard-headed men, judges, bishops, chancellors, mathematicians, are notorious novel readers, as well as young boys and sweet girls, and their kind, tender mothers. — William Makepeace Thackeray.

Pioneer Roofing

"The Roofing that Covers California"

Pioneer Roofing is sun-proof, rain-proof, warp-proof and heat-proof. It is specified by the leading architects and builders as being THE BEST. Statute of Limitations

When notes are given in yearly payments and secured by mortgage upon real estate, does the statute of limitations commence to run against the first note falling due after four years or until four years after the last note has fallen due? Would conditions be the same were the notes given for the purchase price of real estate under contract for delivery of deed when payments were completed? Upon an open account does the statute of limitations commence to run from date of first entry, one item at a time, after two years or after two years from date of last payment? What would be the correct form for a joint note?—Subscriber, Kingsburg.

The first note would be barred by the statute of limitations at the expiration of four years after its date. it would make no difference whether it was upon mortgage or contract; although the contract itself may be so drawn that it would not expire until full payment would be made. Where account is not a mutual one the statute begins to run on each item from date thereof. The statute is now four years instead of two years upon mutual open and current accounts or upon open book accounts. A joint note should read "We jointly and severally promise to pay . . ."

Height of Fence

Is there any state law controlling height or method of building line fence? Also, is there such ordinance in the cities, especially in Los Angeles?—Subscriber, Los Angeles.

The general laws of the state provide that no owner of real property in any city or town shall build a partition or fence exceeding ten feet in height without the consent of his neighbor, except in case of public garden or resort where admission fee is charged and the person violating the act is liable to fine or imprisonment in the county jail.

Suit for Damages

About the year 1879 my father was killed while working for a company. Would like to know if heirs could bring a damage suit now? My mother is living yet and good many of the men that worked with him and know how it happened.—Subscriber, Santa Maria.

The statute of limitations for actions arising out of personal injuries is one year from date of the injury. Therefore nothing could be done.

Contract to Buy

A and B make contract in writing to buy and sell a number of lots upon terms of payment of $100 down and the balance of the purchase price within one year. Contract contains the following provision: "In the event of failure of second party to comply with the terms of this agreement said first party shall be released from all obligations in law or equity to convey said property, and said second party shall forfeit all right thereto." The contract was not acknowledged, nor was it recorded. B has failed to make his payments. Can A sell the lots without legal process to have contract annulled, and can A compel B to complete his purchase?—Subscriber, Riverside.

The contract not being recorded A can sell his property to any third party. B not having fulfilled his contract could not restrain A from so doing, without making tender of the balance due upon the contract. The safest way of course is to bring action to rescind the contract and have the same cancelled. B having agreed in writing to purchase can be held to his agreement.

Line Fence

There is a barb-wire fence between me and my neighbor. Neighbor claims that half of the fence belongs to him and the other half to me. On his fence the wires are down and his stock comes in on my ground and of course does damage. He refuses to fix his fence. I wish to repair it, but he says he will not permit me to do it. Have I not the right to repair it in order to keep his stock off my place, or can he legally prevent me? Or what recourse have I? There is 20 feet between the fence posts. Can I put in some more posts to make it only 10 feet between posts and our whole line fence?—Subscriber, Sonoma.

A fence erected on the line between the lands of adjoining owners generally belongs to them as tenants in common. Either may repair it and may lawfully enter on the lands of the other for that purpose. If either destroys or removes it he is liable to the other. There is no question but that you can put in a fence substantially enabling you to keep out your neighbor's stock.

Property of Wife

A woman owning real estate mortgaged it. Her husband signed the mortgage. She later sued for divorce and got interlocutory decree, but did not apply for final decree, the husband having defaulted. Can she renew or get new mortgage without his signature? He wants entire freedom. What must he do to get it? Can he without an attorney apply to the court by letter to compel plaintiff to complete the divorce or apply for final decree? Plaintiff in one county, defendant in another, residence both established in each place. The charge is desertion.—Subscriber.

If the property is the separate property of the wife she may without his consent convey it and could certainly mortgage it, although invariably people prefer to have the husband join in the instrument.

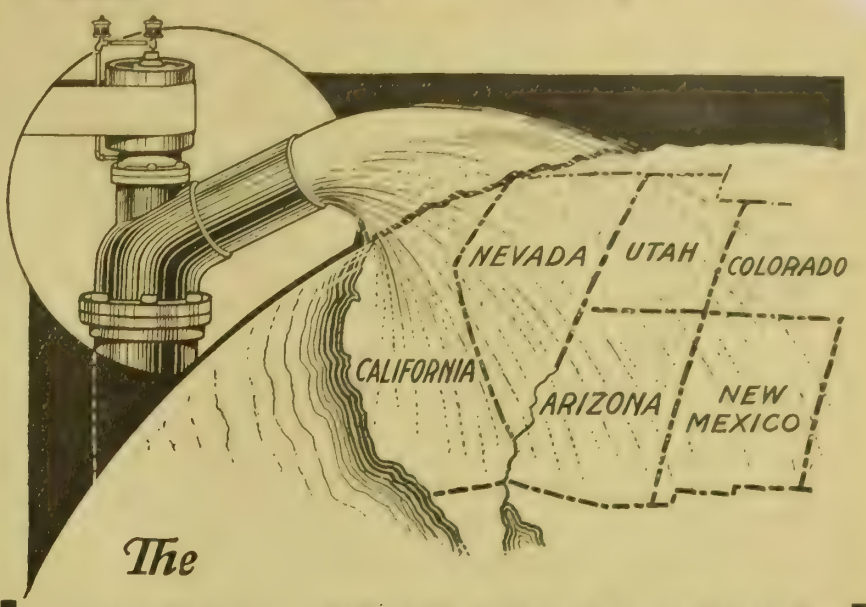
When one year has expired after the entry of interlocutory judgment the court upon motion of either party or by its own motion may enter the final judgment, and doubtless the court would upon your request see that the final decree is entered, which may be done without cost unless you desire a certified copy, which would cost you 50 cents, payable to the clerk of the court.

Deed of Minor

A widower deeded his farm in Kansas to his son, who was 20 years old when this deed was recorded. Afterwards and before this son became of age he deeded this same land to his sister and this deed was also recorded. Now the question is, who is the legal owner of this land, the son or the sister?—Subscriber, Riverside.

A minor may be a grantee in a conveyance of land and the title vests in him subject to his right to disaffirm the conveyance when of full age. The deed of a minor purporting to convey real property operates to transmit the title, although it is voidable at the election of the infant. Being voidable it would require definite action by the minor within a reasonable time after coming of age to avoid this deed. If he should ratify same by acquiescence in the transaction, or by not taking action within a reasonable time, his right would be lost.

LAYNE & BOWLER PUMP



The
LEADING IRRIGATION PUMP

Its past record is the best evidence of a pump's efficiency and economy. The Layne & Bowler has long had the reputation of being the leading irrigation pump, not only here in the great Southwest where all manner of rigid conditions must be met, but all over the world. Positively the cheapest water produced. No pit. Constructed to go inside of well casing 9⅝ to 30 inches in diameter. Write today for valuable irrigation booklet No. 30.

The Layne & Bowler Pump, is the Only One Pumping from Wells on the San Francisco Exposition Grounds.

¶ The purity and genuineness of the seed you buy depends upon the honesty of the grower and seller.

¶ No less an authority on SUDAN GRASS than Mr. B. Youngblood, Director, Texas Experiment Stations, has made the statement that there is no such a commodity as "Government Inspected" or "Government Tested" seed. Seed inspections were made by the Experiment Stations and certificates issued, but such are worthless unless the grower faithfully observed the conditions and regulations which governed the harvesting, grading and tagging of the seed.

¶ All seed offered for sale by the LUBBOCK SUDAN GRASS SEED ASSOCIATION was procured from those fields only that were passed and certified to by the Inspectors of the Experiment Station last season, and harvested in absolute conformity with all conditions laid down. Under the standards we have adopted, all seed of Class 4 and Class 5, which are grades below that of pure seed, were rejected. All seed sold by the Association goes out under a warranty of purity, and each bag bears the name of the grower and the report of the inspection committee. Mr. Victor L. Cory, Superintendent of Sub-Station No. 8, situated in Lubbock County, certifies to this.

PURE SEED IS SURE SEED.—Don't risk a poor crop and certain ruin of your land by infesting it with weeds and Johnson grass merely to save a few dollars on the seed you buy. Get LUBBOCK ASSOCIATION GUARANTEED SEED—guaranteed pure, genuine and sound seed.

¶ AND BUY NOW.—There won't be enough Pure Seed to go 'round. Every consideration of prudence and economy should compel you to put in your order without further delay.

Put up in 1-2-5-10-25-50 and 100-lb. packages.

Poultry for Profit

EARLY HATCHING

Written for California Cultivator
By Jean A. Koethen

To hatch or not to hatch, that is the question;
Whether 'tis better for the purse to daily,
And calmly wait for Mother Biddy's clucking,
Or to rise up in fierce determination
And start the incubator.

I HAD read Hamlet's immortal soliloquy many times, but I never fully understood it till I saw Forbes-Robertson's Hamlet last fall. Forbes-Robertson plays Hamlet with a droop of the shoulders, the attitude of a man who sees exactly what ought to be done but hasn't the backbone to do it. Perhaps it is stretching the point a bit to apply Shakespeare to chicken raising, but I suspect a great many amateur poultry people this spring have been arguing the pros and cons of early hatching with themselves, only to sit still in the end and wait for the right hen to get broody. "After all," they argue, "if the early bird does get the worm, it is the early worm that gets caught."

There never was a spring when so many people were saying, "hatch early." Eastern papers are saying it; Western poultrymen are saying it; everybody interested in the progress of the poultry industry is saying it. Next fall, they say, egg prices will soar. Sooner or later, they declare, there must be a tremendous demand for breeding stock. Keep a stiff backbone and get out your early chicks.

After several years of experimenting with both early and late hatching, the reasons for early hatching have shaped themselves in my mind in this way:

Early hatching means more profit from pullets. January pullets, to be sure, are almost certain to molt after laying a few clutches of eggs. Some February pullets will do the same, but they will all be laying again by January and will make splendid breeders in the spring. I am not sure that I should advise hatching in January unless the pullets were needed for breeding, but I should certainly not fail to get out at least one lot in February. They may not molt if they are carefully handled, and if they do not molt they will be the best of fall layers. My own incubator has been running some weeks now and I take great satisfaction in counting the February pullets I shall have—barring accidents.

But whatever you decide about hatching in February, don't fail to hatch every chick you possibly can in March. March is generally considered the best month in the year in this climate. March pullets rarely molt in the fall unless they are fed a very forcing ration, and the March pullet and the one hatched early in April are the birds that will do the fall laying. A great many Leghorns hatched later than this will begin to lay in November, but the birds that are to be depended on for fall laying are those hatched before the middle of April. Many authorities say pullets of the heavy breeds should be hatched a month earlier than Mediterraneans in order to begin to lay at the same time, but I have not found this to be true. More depends on the strain than on the breed. Only the other day a woman said to me, "I've no use for Orpingtons. They never lay till they are ten months old." As if one could ever say "never" about chickens! My April Orpingtons all began to lay in November last fall, and my experience is that a good proportion will always do it, but March pullets are more sure. The point is that pullets that are not hatched early enough to begin laying in November are hardly profitable enough to be worth raising, and it isn't wise to trust to luck and argue that maybe the May pullets will lay in November, after all, for most of them will not.

Early hatching means more profit from cockerels. Cockerels hatched in February will be just the right age for breeding next January and the best of them may in many cases be sold for this purpose. Broilers and fryers hatched in January and February and marketed in April and the early part of May will bring nearly twice as much as cockerels hatched in May and marketed in August. If these late cockerels can be caponized and held till January they will perhaps be as profitable as the early cockerels, but very few farmers and back-lotters are in a position to caponize.

In this climate, at least, we may expect that early chicks will have stronger vitality and make more rapid growth than those hatched later than April. I have seen this so many times that I feel the assertion cannot be made too strong. One stormy January I remember giving a brood to a hen in a small coop with only the usual wire run. I was fussing over them continually, trying to keep them out of the rain, and yet between showers these chicks were always out, and they did not always run to shelter the moment it began to sprinkle, either, and I never saw chicks grow so fast. Another spring torrents of rain came down our hill, flooding the pen where I had several broods of chicks, one hen with 22, and never a chick was lost. The only chicks I ever lost because of rainy weather were part of a little bunch that got caught away from the coop one day when I was away from home. I found them drenched when I returned and saved most of them by taking them into the house and quickly warming them up. We have all had similar experiences, and it only goes to show that chicks, like the rest of us, are hardier in a cold climate or in cool weather. With artificially reared chicks the case is somewhat different, yet Professor Dryden of the Oregon station after repeated experiments declares that when chicks must be artificially hatched and artificially reared the odds are all in favor of the early ones. In every case where records were made it was found that early chicks were more vigorous than those hatched in warm weather, and the conclusion was that where hens are not available for all hatching it is better to use incubators in the winter and early spring and hens in late spring.

Seasons vary greatly, and we are not always sure of rain in February and March, but I am quite certain that when these months are rainy the incubators do better work than they do later. To put it in another way, the dryness of interior valleys of California is against the best results with incubator hatching, and when we are so fortunate as to have a very wet spring, that should be an additional reason for not letting the early weeks go to waste. The best hatches I have ever had I had in wet weather. I am sorry now that I did not keep records, but I remember that the first year I used an incubator I got a chick from practically every fertile egg, and it was raining most of the time.

The green feed question is one that should not be ignored in deciding when hatching can best be done. Where water is plenty and cheap this is not important, but where every gallon of water must be made to count there is a great advantage in hatching while every vacant lot and unspaded corner of the garden is covered with green. Alfilaria, burr clover, wild mustard, wild radish, and indeed any sort of green gives the growing stock the succulent green they need, and they cannot have too much of it. In June and July, when only the cultivated greens are left, the providing of this most necessary part of the diet becomes something of a problem. Perhaps this is one reason why late

chicks rarely do well. Any vacant lot or field furnishes green range for the early chicks. Even if they must be kept in wire runs the runs can be moved to fresh ground and the green kept under foot. When only the grain that can be grown in the pens is available, this grows more readily in spring than later.

Important as weather, climate and green feed are, they are perhaps no more important than the disposition of the caretaker. It is easy to say, "Given proper weather and feed conditions, chicks should do as well in July as in March," the fact is they almost never do. If the chick is a little lacking in its enthusiasm for life in warm weather, the caretaker is more so. It is possible that a person who hatches his first brood of chicks in July might give it the same enthusiastic attention that he would give in March, but I doubt if any one who begins hatching in March or April and continues to July gives the last chicks the care the first receive. Somehow, we just peter out when the warm days come, and fortunate indeed are our chicks if they are old enough to be independent.

As I have already suggested, it may be necessary in order to have early chicks to use an incubator. The old hens have laid off in the fall and are not ready to sit. The pullets have their broody spells, but the first broodies are the pullets that have laid most steadily through the fall, and we should be foolish indeed to let them sit. The incubator does not as a rule give as large or vigorous chicks, but an incubator chick is better than no chick at all and these early hatches ought, if the parent stock is what is should be, to give some thrifty birds and a good per cent of early, well matured layers. An incubator of any good standard make, holding from 100 to 200 eggs, makes it possible to get out a hundred or more of these desirable early chicks. The first lot will have to be raised artificially, but there will very likely be broody hens that can be broken in to take care of the second lot, and if the machine is set a third time, hens can be set at the same time and all the chicks mothered by the hens. It is not necessary to have an incubator cellar, though this is of course desirable. A fairly tight barn or feed house, if it is only quiet and has a firm floor, does very well when only a few hatches are run off in a season, and an unoccupied room in the dwelling house is often satisfactory.

However we do it, whether we buy broodies from the neighbors or hatch with incubators or buy our chicks ready hatched, let us not fail to get them early. It is not quite so easy caring for them in wet weather as later, but the greater vigor and earlier maturity of the birds will repay any extra trouble. Possibly this greater vigor of the chick is due to greater vigor of the germ at the beginning of the season while the hens are still fresh from the rest of the molting period. Perhaps it is due to the weather. Whatever the cause, if we want fall layers we must hatch betimes and give every pullet her full time to mature before November.

HOW TO DRAW A CHICKEN

Following are the directions given by the poultry-dressing specialists of the department for drawing a chicken at home:

(1) Hold the chicken by the legs and run it quickly over the flame from a loosely-twisted lighted newspaper which, for safety, may be laid in a coal bucket or ash tray. This will remove the fine hairs. Remove any pin feathers with the aid of a sharp, small knife blade. The charred hair may be washed off later.

(2) Cut the legs off well below the knee joint. If the legs are cut above the knee the flesh on the drumstick will be pulled back from the end.

(3) Cut the head off, leaving as much of the neck as possible, then push the skin of the neck back and cut the neck off quite close to the body. The envelope of the remaining skin gives the dressed bird a neater appearance. The neck bones with the adherent meat make a valuable addition to the giblets. The gullet and windpipe are, of course, on the neck and must be pulled away.

(4) To remove the entrails, make an incision about two and one-half inches in length across the abdomen and as close to the vent as possible. In making this incision, be careful not to penetrate the intestine. Slip the fingers in first, and gradually insert the whole hand through the slit into the body cavity. Work the viscera loose from its attachments by sliding the fingers over the inner surface of the body walls. In this way, after a little practice, the viscera can be removed quickly and easily. The lungs will almost invariably tear, leaving shreds sticking to the back. These, and the kidneys of the chicken, which are two long, dark red bodies lying each side of the backbone and firmly fastened, should be removed in pieces. The rest of the viscera, including the crop which lies far front and just under the skin of the breast, when loosened will come out in a mass through the incision. The intestine is still attached to the bird at the vent. To separate it clearly, the tube should be picked up just as close to the vent as possible and its contents pushed well back from the vent. Then cut closely around the vent, holding the intestine tightly between the fingers to insure cleanliness. Run a stream of water through the slit into the body cavity in such wise that it flows out through the vent and cleans the short piece of intestine still remaining. Then cut both vent and intestine away, leaving a neat, round hole no larger than is necessary.

To prepare the giblets, detach the heart, gizzard, and liver, taking great care not to break the little green gall bladder attached to the liver, which contains a very bitter liquid which, if allowed to escape, will give a bitter flavor to the giblets and gravy. This gall bladder is so close to the liver that some liver tissue must be cut away to be on the safe side. The color of a healthy chicken liver may vary from yellow to dark red. To prepare the gizzard, hold it with the thin edge toward the palm of the hand and make an incision the whole length along the thick side, being careful merely to cut through the muscle, but not into the inner sack. Then open the gizzard as you would a pocketbook and remove the inner sac, which is full of gravel, if possible without breaking it.

Finally, wash the chicken and giblets in clean, cold water, but do not let the chicken soak in the water, because the finest flavors of the meat and much nutritive material are dissolved in the water.

Once the chicken is dressed and washed, put it at once in the coldest place available and keep it there until it is to be put on the fire. The best way is to dress it just in time to go into the stove.

Tells why chicks die

E. J. Reefer, the poultry expert of 405 Main St., Kansas City, Mo., is giving away free a valuable book entitled "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

QUICK RESULTS

We are sometimes a little slow to adapt ourselves to modern methods of doing things. The following is taken from a daily paper under a New York date line and shows how much swifter returns are secured in that poultry center than in California:

"Bill" figured that if an incubator hatched chickens out in twenty-one days, the some result could be had in one day if the heat was increased by 2100 per cent. So "Bill" set seven eggs in the incubator and twenty-four hours later a healthy looking chick was bursting out of its shell. "Bill" hastened to the barn to get some cornmeal.

On his return "Bill" found the chick had grown into a full-sized rooster, so "Bill" ran again to the barn to get some cracked corn. But when he returned the rooster was roasted to a turn.

Change is essential to mental, moral and physical health; even our spiritual natures derive benefit from hearing old truths in a new way occasionally. Going entirely away from one's daily associations and tasks now and then is the best cure for discontent and weariness.

Spavin

My horse, seven years old, has a jack spavin. Would you advise an operation? Would it be a success or could a local treatment be applied to any advantage?—Subscriber, Santa Cruz.

An operation by a veterinarian who knows his business would probably be best. A local application is of very little use unless it be something pretty strong.

Lameness

Have a large mare 13 years old that is at times very lame on both front feet and one hind foot. She seems sensitive to pressure on each foot just above the hoof where there is a small growth on the side. She is more lame sometimes than at others. Have blistered several times with caustic balsam which gave relief but has not overcome the lameness. What is the trouble? What is the cure?—Subscriber, Selma.

The lameness may be ringbone, sidebone or founder. Ringbone is the uniting of the two bones that form the joint just above the foot, causing a bony growth which may appear only at the sides or may extend all the way around the ankle. Sidebone is the hardening of the cartileges that are on the side and just above the heels but do not extend front farther than half way on the side. Founder is inflammation of the soft tissues just inside the hoof and in time will cause contraction of the hoof. In either of the three troubles there will be soreness on pressure just above the hoof and one must know the anatomy of the foot to be able to say which parts are affected. Letting the horse go barefoot for a time will probably help a great deal. Remove the shoes and pare the feet as you would to put on a shoe, only pare the heels more so the frogs will come to the ground. This may increase the lameness for a time. Blister above the hoofs, but not in the hollow at the heels, with an ointment made of cantharides, one ounce; biniodide of mercury, one ounce, and lard, eight ounces. Mix and rub it in well with the fingers and warm it in with a hot iron. Tie the horse so he can not reach it with the nose for 24 hours, then grease it with lard. Repeat the blister every two weeks until three or four blisters have been applied.

To Stop Horns Growing

We have a calf that we wish to raise and have been told there is a method of stopping the horns from growing by applying some acid but have forgotten the name. Will you kindly give us the name as we do not want later to have to dehorn it?—Subscriber, Oceanside.

To prevent the horns growing clip off the hair and wet a spot about the size of a dime, where the horns are about to start, with nitric acid or caustic potash. In handling these caustics be careful no to allow them to touch the hands or clothing.

Abscess

Holstein cow had a swelling appear on chin two months ago. Her nose ran for about ten days and she did not eat for a few days but soon began to chew her cud and appeared healthy. We rubbed swelling with a mixture of turpentine and oil and gave a dose of linseed oil for a cathartic. The lump moved upward to just below the right ear when we poulticed it and

Alfalfa Seed—Pure and fine, $12.00 per hundred by the sack. Enquire of H. S. Garrison, grower, Murrietta, Cal.

Attention Dairymen—Plant Sorghum for green feed or ensilage. Seed for sale in lots to suit. A. L. Sayre, Madera, Cal.

For Sale—Sour orange seed, 75c per quart prepaid, by mail, or $15.00 per bu. F. O. B. J. M. Chaffee, Enterprise, Fla.

Rice Seed for Sale—Free of grass or other seeds. Write Jesse Peter, Pond, Kern County, Cal.

FARM LANDS FOR SALE

For Sale—400 acres near Orosi, Tulare County. I offer tracts of 20 acres or more. If you will make improvements I will give you possession without paying one cent down on the land, and you need pay me nothing for three years, except the interest and taxes. The soil is especially adapted to the growing of figs, olives, peaches, plums, grapes, oranges and many other crops which are in full bearing on all sides of this 400 acres. Price, $150.00 an acre. First payment 1918, balance in annual installments. Investigate now. Planting time soon here. W. C. McKee, 546 Title Insurance Bldg., Los Angeles.

VICTORIA, AUSTRALIA, WANTS SETTLERS

Special inducements; government land, railways, free schools; cheap irrigation; 31 years to pay for farms adapted to alfalfa, corn, grains, fruit, etc.; climate like California; ample markets; reduced passages; special excursion being arranged. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

Apricot Land Bargain—300 acres ideal apricot land near Watsonville in tracts of 20 acres or more, at $100 per acre; easy terms; adjoining lands in full bearing orchards have netted annually $200 an acre for past six years. Get full particulars from Farm & Forest Realty Co., Watsonville, Cal.

C. M. Wooster Co.—25-year experts in land and mortgages; investers will save money and avoid errors by consulting them; land in all counties. 303 Phelan Bldg., San Francisco.

For Sale—10 acre Walnut Ranch close to El Monte. Modern 6-room house. Pumping plant furnishing 100 inches of water. Write for terms and description to owner. R., 1802 Bush St., Santa Ana, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—Orange, olive, peach and rice land. Close in, on good terms. Fred Hart, Exeter.

SCHOOLS AND COLLEGES

Telegraphy — Stenography, bookkeeping, English branches. Positions guaranteed. Mackay Business College, Los Angeles.

GARDEN BOOKS

A few hints on gardening is the title of the latest garden book. Perhaps it should hardly be classed as a book for it is the catalog of seeds, bulbs, plants, etc., of the Morris & Snow Seed Company, Los Angeles, but it contains such a fund of information regarding seeds, bulbs, plants and garden tools that it is very valuable. Much information is given regarding calendar of planting operations, amount of seed per acre, number of plants per acre and cultural instructions covering almost everything in the garden. If the Cultivator is mentioned it may be had on post card request to Morris & Snow, 439 South Main Street, Los Angeles.

MAKING GOLD

George C. Roeding of Fresno is mailing a recipe for making gold. It would have but little interest for the miner, however, for he only brings into use what he finds. This is a for sure "method of making" gold, but it will have interest only for the orchardist, the vineyardist or farmer who has the faculty of growing the gold from a mixture of good soil and a scientifically prepared fertilizer. Those interested along this line might well secure the book from Mr. Roeding.

it opened in two places. The cores were removed with slight pressure. The cow is fresh now about two weeks and the sore does not want to heal. The cow is in a healthy condition and gives plenty of rich milk. We have been feeding hay that has some foxtail in it. Can you tell us what to do for her?—Subscriber, Oceanside.

The trouble may be due to the foxtail working through from the mouth. The tract that they follow probably runs down from the opening. Someone who understands such work should pass a probe into the opening and trace the course to the lowest point and cut an opening there. Then by injecting warm water with a few drops of carbolic acid in it into the upper opening and allowing it to escape by the lower one the wound should soon heal.

Pig's Legs Helpless

I have pigs which seem to be entirely helpless in their hind legs. They crawl around using their fore legs and dragging the remainder of the body. What is the trouble and how may it be cured or prevented?—Subscriber, Tulare.

Get the following from your druggist: Tincture of nux vomica, two ounces; tincture of juniper, four ounces; salicylate of soda, half an ounce; acetate of potash, one ounce, and enough water to make one pint. Mix and give from a teaspoon to a tablespoon, according to the size of the pigs, in the feed twice a day.

Strong Butter

We have a Jersey cow and the butter from her cream gets strong in two or three days after churning. Am feeding her two quarts bran and one quart corn meal twice a day with an armful of green barley morning and evening and nice alfalfa hay at noon. Do you think the green barley would cause the butter to become strong or what would cause it?—Subscriber, Arlington.

There are so many details that must be carefully followed in making first-class butter that it is hard to say where the trouble is. First be sure that everything used in connection with the milking or handling the milk be thoroughly scalded with boiling water, also that the cloths used in washing the buckets, etc., be scalded. It might also help to give the cow the following powders: Powdered gentian, six ounces; powdered nux vomica, three ounces; bicarbonate of soda, eight ounces, and epsom salts three pounds. Mix and give a handful in the feed twice a day.

Horses Eating Wood

We have a team of horses, eight and nine years old, that persist in eating wood. We have to line everything about the stalls with strap iron. They are in fine condition and have plenty of life. They have been that way for five years. We feed good oat hay with a change to alfalfa two or three times a week and rolled barley when at work.—Subscriber, Azusa.

There was probably some good reason for the trouble at first but by continuing so long it has become a habit. Have a veterinarian examine the teeth and put them in good order; also push the gums back on the inside of the front teeth. Cutting the gums is not necessary. Then after each meal put on a muzzle or tie them so they can not reach anything. Medicine would be of little use in this case.

Blood Wart

Have a mare with a blood wart on the udder near one of the teats. It has increased somewhat in size in about six months since I have owned her, and is now larger than an English walnut. It seems either to have been hurt or more likely to have run a little, although it is not running now. What caustic is best to apply if it is not removed by cutting it off?—Subscriber, Beaumont.

The trouble may have been caused by a snag and a small splinter or something may still be in the lump. Get some nitric acid and put it on a spot, in the middle of the lump, about the size of a nickel. When the scab comes off, if pus follows there is something inside, but if it only leaves a red spot it is a wart and you may need to repeat the application of the acid.

ESTABLISHED REX 1896

For Citrus Spraying

REX LIME and SULPHUR SOLUTION

Minimizes Scale Troubles, Controls Red Spider, Destroys Fungous Growth, Tones and Vitalizes the Trees.

For Deciduous Spraying

REX LIME and SULPHUR SOLUTION

Kills the Insects, Destroys the Eggs, Deadens the Fungus Spores, Is a Tonic, Fertilizer and Vitalizer for the Trees. Is the best general clean-up Spray there is. Most efficient and used in larger volume for Peach Leaf Curl and Twig Borers year after year.

For Vineyards

REX LIME and SULPHUR SOLUTION

Sprayed on vineyards during dormant season, destroys the fungus spores and equals any spray in controlling mildew.

The Rex Companies Specialize Spray Materials and our chemists devote their entire time to this work. Eighteen years of continuous Spray business means that Rex Sprays have the virtue. They are the standard.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Frozen Back Nursery Stock

I own large tract in Fresno County for which I had planned an orchard of orange trees to be set two years ago. Natural conditions are all right but the nursery in which the trees were was badly frozen in the 1913 freeze. I had already bought a large number of trees and had paid for them. They were frozen back below the bud and since that time have been rebudded and are now ready for planting. Is it wise to plant them or should I get new trees that have not passed through such a cold spell, especially in consideration of the lower price at which trees may now be bought?—Subscriber, Cleveland, O.

We answered the subscriber by mail in effect that if the nurseryman understood his business and used precaution to secure buds of highest value perhaps the trees would still be worth the planting. However, a personal inspection of the trees would be necessary before any positive information could be given. The matter was referred to Dr. J. Eliot Coit and he answers:

"It is truly unfortunate to be caught on a falling market with 2200 orange trees which have all been paid for. The question as to whether it would be better to abandon the trees and buy new ones is difficult to answer without examining the trees in question. It would depend also, to some extent, on the quality represented in the 2200 trees. Does the inquirer know anything about the buds from which these trees were propagated? These days planters usually insist on knowing something of the source of bud wood in order to insure the productivity of orchards. If this knowledge is not at hand and the roots are very large and clumsy perhaps it would be a good plan to secure new trees. If, on the other hand, the buds were carefully selected from profitable trees and the roots are not too large the trees might be used to advantage. I rather imagine that if I were able to examine the trees I would pick out from the lot a certain proportion which, in my judgment, were good enough to use and then buy enough to fill out the number, discarding some of the worst ones."

Almonds on Dry Hillsides

I have upland ranch in section where the rainfall averages 10½ inches. It is some six miles southeast of Riverside. The soil is red disintegrated granite, at an elevation of 1500 feet. It is almost frostless, which is proved by the fact that there are now tomato vines on the place over three winters old. Would like to know regarding the planting of almonds on this land. There is little water for irrigation.

The inquirer can raise almonds on soil eight feet deep and also on the three-foot soil, provided he can get through it by blasting and expose open soil below. I, at one time, made soundings south of Perris on rolling soil with a rotten granite subsoil, but there was a solid granite just beneath the decomposed layer. The decomposed portion was simply the shell overlying the genuine foundation rock. Trees on that will fail unless irrigated frequently. I think the inquirer's land is just about the same as the rocky stretch which lies along toward Boxwood canyon, which would take in his place. A little farther east would take him into the hardpan country, which is good, as the hardpan is thin, with plenty of water below.—J. W. M.

Planting Near Large Trees

What may I plant in a small plot shaded by cottonwood trees? The plot lies along the north side of the row of cottonwoods. What fruit or vegetables or shrubbery may I grow there which will do well in shade and where the moisture is not especially liberal? —Subscriber, Artesia.

This was referred to Mr. D. F. Reichard, who answers:

I am afraid your inquirers are up against a hard proposition when they want to get something to grow on the north side of a row of trees such as cottonwoods, as the roots are so near the surface that they sap all the nourishment from the ground for several feet around. The only way they could get anything to grow outside of some short rooted grass would be to fill in with a foot or so of good soil and in this way grow a crop for possibly one year. By the end of that time the roots of the trees would be all over this new soil, robbing it of what nourishment there was in it. Shady lawn grass would be the only thing we could recommend for planting on the first 10 or 15 feet on the north side of the trees. Farther out the roots of the trees would not be so bad and there would be more sun. From that distance out deciduous fruit trees would live, or by taking care one could grow vegetables and flowers of suitable varieties. We have heard of people raising a very good garden close to cottonwoods where they had plenty of water.

Feed for Dairy Cows

I am feeding alfalfa hay and ensilage, bran at $35 and cotton seed meal at $34 per ton. What would be the cheapest feed for dairy cows and how much?—Subscriber, Gardena.

Although you have a well balanced ration with corn silage and alfalfa, as far as the carbohydrate and protein are concerned, if you have heavily producing cows it will pay to feed concentrates in addition. As far as the value of protein is concerned, the oil meal will furnish it at a less cost than bran at prices you quote. We would suggest that some rolled barley be added to the cottonseed. How much grain to feed must be determined by the use the cow makes of the feed, and the added gain she returns for it. The feeder must be the judge of this. You may find that there will be cows well along in the lactation period that will give as good results, as far as milk flow and condition are concerned, without grain in addition to alfalfa and corn silage as with it. Other heavy producers will pay well for several pounds of grain per day. Cottonseed meal contains 34 per cent of digestible protein, wheat bran 12.5 per cent. The protein in cottonseed meal at the prices quoted would cost about four and one-half cents per

pound, in bran about 13 cents.—W. S. G.

Land Open to Entry

In the issue of the California Cultivator of January 21 I notice announcement that on February 15 there will be 60 sections of land in the Kern national forest opened for settlement. Could you tell me where this land is situated or to whom I should write to make inquiries regarding it?—Subscriber, Corona.

Apply at the United States land office at Visalia, California.

Hampshire Hogs

Would you please tell me the name of the hogs that are black with a white band around them? Where can purebreds of this stock be bought?—Subscriber, Maple Creek.

These are the Hampshire, sometimes good naturedly called "Dutch Belted" swine.

Pine Needle Mulch

We are repeatedly asked as to the value, or otherwise, of pine needles as a mulch. Many have seen lawns under pine trees die out and have wondered if there was anything of a poisonous nature in the needles. The question was submitted to Prof. Charles B. Lipman of the state university and he answers:

"Pine needles may be used to very good advantage as a summer mulch in carrying out the recommendation which I have been making for the last two years, to cover the soil after the middle of May or the first of June with straw, manure or similar covering, and to do away with cultivation for the rest of the summer. I should cover the soil at least one inch thick with the pine needle material, if I were using that, doing it about the first of June, or a little earlier, and then stopping all tillage or interference with the soil in any way, except for irrigation purposes, in which case the pine needles may be moved aside for making the temporary furrows. At the end of the summer, or just before the fall rains, I should advise removing the pine needles, that still remain in a dry condition, to the barnyard and mixing them there with manure for a period of three or four weeks at least, so as to insure their decay. Then they can be used like any other composted material or manure material in midwinter or early spring."

Dattier de Beyrouth

In answering a query as to value of the Dattier de Beyrouth grape, Prof. F. T. Bioletti writes:

From what little I know of the Dattier de Beyrouth grape it appears to be very promising, but as it is a new grape and has been insufficiently tested, I could not advise any one to plant it on a commercial scale. The grape, where it succeeds, is large and of somewhat better flavor than the Malaga, earlier and appears to have good shipping qualities, though this is as yet undetermined. It would certainly ship well to local markets, but how well it would ship East I do not know. Its main defect appears to be its tendency to form shot grapes or very loose bunches. I think it would be a mistake to plant any grapes in a young almond orchard. The almonds will come into bearing almost as soon as the grapes and it is not good practice, as a rule, to grow two fruits on the same land. What one obtains the other misses. If inquirer wishes to grow both almonds and grapes I should advise him to plant them in separate blocks.

Powers of the Governor

Please answer in the Cultivator as to whether Governor Johnson has extended time for suppressing nuisances

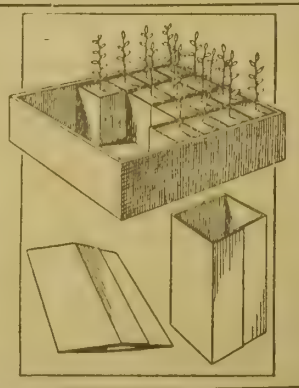
THE EXPAN CO., 935 E. Central Ave., Redlands, Cal.



in the city of San Francisco. I refer to enforcement of constitutional amendment passed at the recent election. If he has done so does he have power for such action?—Subscriber, Parlier.

We have heard of no such extension of time and the governor has absolutely no power in the matter. The only power which could revoke the action taken at the last election sustaining the state legislature in the referendum is the people and they must reverse their own action.

Casaba Melons

Please inform me where we get the casaba melon? Is it an original species or a cross derivative?—Subscriber, Kansas City.

The casaba melon is a native of Persia. It has been developed in California as in no other section. Some of the finest hybrids have been sent out by seedsmen of this state. There have been some new introductions direct from Persia during the past year which are said to promise exceptionally well.

Plowing

In plowing with one horse please tell me whether the horse walks on the land or in the furrow?—Subscriber, Crows Landing.

If the one-horse plow is used in orchard work and it is desired to throw the dirt toward the tree the horse would walk on the unplowed land. If desired to throw the dirt away from the tree the horse would walk in the furrow. The draft of the plow is controlled by swinging the clevis to one side, sometimes having a three or four-inch block to hold the clevis away from the beam so as to give direct draft.

Measuring Hay

How many tons of hay in a stack 200 feet long, 27 feet three inches wide and 39½ feet over?—Subscriber, Brawley.

There are many questions to be considered in estimating the weight of hay in a stack or mow; the kind of hay, the length of time in stack, and the condition it was in when cut. Hay fully ripened will usually lie up looser than that which is cut while young and while the stems are soft. Loosely thrown up straw soon after stacking has been found to run nearly 1000 cubic feet per ton while with alfalfa or the heavier hay it has been found that a cube seven feet square, or 343 cubic feet, is sufficient to make a ton, therefore with this immense variation only those knowing the general condition can answer definitely. For alfalfa which has been stacked 30 days we presume 512 cubic feet per ton, which means a cube eight by eight by eight, would be fair. On this basis the stack referred to would contain 108 or, more correctly, nearly 109 tons. If it has been stacked a year and has the above dimensions perhaps a seven and a half foot cube or a total of 422 cubic feet per ton would be fairer. The rule used to determine the weight of hay in a stack where the dimensions are as given by the inquirer is as follows: After throwing the line over and determining the distance from the ground on one side to the ground on the other side add that to the width of the stack. In this case it gives 66¾ feet. Divide this by four, which gives a quotient of 16 11-16. Square this quotient and divide the product by the number of cubic feet allowed for each ton. This matter of determining what is a fair basis can only be had by one who knows something of the circumstances of the stack or condition of the hay, etc.

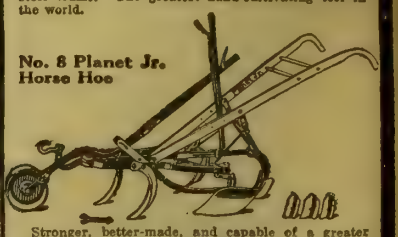
Planet Jr. Wheel Hoe: Horse Hoe

Planet Jrs. are the most economical farm and garden tools you can buy. They are made the best, last the longest, and give the biggest results. Fully guaranteed.

No. 11 Planet Jr. Double Wheel Hoe, Cultivator, Plow and Rake

A single and double wheel-hoe in one. The plows open furrows and cover them. The cultivator teeth work deep or shallow. The hoes are wonderful weed killers. The rakes do fine cultivation. Unbreakable steel frame. The greatest hand-cultivating tool in the world.

No. 8 Planet Jr. Horse Hoe



Stronger, better-made, and capable of a greater variety of work than any other cultivator made. Non-clogging steel wheel. Depth-regulator and extra-long frame make it run steady. Adjustable for both depth and width.

The Household Department

IF NOBODY SHIRKED

I know not whence I came,
I know not whither I go;
But the fact stands clear that I am here,
In this world of pleasure and woe.
And out of the mist and murk
Another truth shines plain—
It is my power each day and hour
To add to its joy or its pain.

I know that the earth exists,
It is none of my business why;
I cannot find out what it's all about,
I would but waste time to try.
My life is a brief, brief thing,
I am here for a little space,
And while I stay I would like, if I may,
To brighten and better the place.

The trouble, I think, with us all,
Is the lack of a high conceit.
If each man thought he was sent to this spot
To make it a bit more sweet,
How soon we could gladden the world,
How easily right all wrong,
If nobody shirked, and each one worked
To help his fellows along!

Cease wondering why you came—
Stop looking for faults and flaws;
Rise up today in your pride and say,
"I am part of the First Great Cause!
However full the world,
There is room for an earnest man,
It had need of me, or I would not be—
I am here to strengthen the plan."

—Ella Wheeler Wilcox.

THE HABIT OF VICTORY

By Lawrence Lowell, President of Harvard University

THE philosopher's stone was eagerly sought in the middle ages, because it was believed to turn everything it touched into gold. Many men wore out their lives in seeking it, and doubtless blew themselves up by chemical experiments in trying to produce it. Yet, after all, of what good is gold? People crave it because they can get with it other things they want; but if a man could possess a talisman that would give him the habit of success in everything he tried to do, it would be better than a philosopher's stone, which would simply insure him an indefinite supply of gold—for many kinds of success cannot be bought with gold.

There were two questions to be asked about the famous philosopher's stone—first, could such a thing exist; and second, how could it be acquired? We are now sure that no such stone could exist, and hence it is fruitless to ask how it could be acquired; but is it equally certain that the more valuable habit of success or victory cannot exist? Anyone would naturally answer that if you happen to be stronger than your antagonist you will beat him in lifting weights; that if you happen to be swifter you will win the race; that if you are cleverer you will outrank him; but that if you are weaker, or slower, or more stupid, no habit of success can help you; just as if you are rich you will have gold, if you are poor you will not; no philosopher's stone can give it to you.

To some extent that is true; but it is not the whole truth. In histories of battles we often read that the troops were dispirited by defeat, and this is evidently regarded as making them less likely to win the next day; or we read that they were flushed with victory, and that their charge was well-nigh irresistible. School boys used to read about Caesar's tenth legion, which was almost always victorious, and we have heard in our own day of "Chinese" Gordon's invincible army. The fact that troops have been victorious, and expect to prevail, does undoubtedly add to their fighting quality and chance of success; whereas the fact that they have been beaten, and expect to be beaten, is an element of weakness. In an army, then, there is such a thing as a habit of victory, and it has an effect in battle.

What is true of an army is true also of a man or a boy. We all know by experience that expecting to win, and having usually won, makes a man more likely to win; and that a feeling of despondency—the assumption that you are sure to be beaten—is a bad omen. We tell the boy to cheer up, and try to encourage him by showing him that his chances are good, because we know that, without a strong hope of winning, there is little chance of victory. Even in mere trials of strength this counts for something, and something that is not very small. In such contests the habit of victory is not to be disregarded; and in other contests— those in which grown men engage—in the complex things of the world, where mere strength, physical or mental, is only one element, the habit of victory counts a vast deal more.

Whether the contest is with other men, or with the stubborn forces of nature, the man who is despondent or downhearted, who loses his courage, has no chance compared with the sanguine man who believes in his power to succeed, and who is accustomed to doing what he sets out to do. In short, the qualities that make for success in the struggles of life are moral no less than physical or intellectual. They will not insure success against all odds; but they will add much to the chances where they are at all evenly balanced, and sometimes will wrench victory from conditions that seem heavily adverse. These qualities belong to the man who has them; they do not come and go; they are permanent, and make the man win when he would not otherwise do so; he is marked as a man who is habitually successful.

In short, there is such a thing as a habit of victory, and it is worth more than the philosopher's stone.

To the second question—how can the habit of victory be acquired?—the answer is very simple. It is acquired by constantly winning victories, for one who always wins has the habit of winning. Of course, this does not mean trying only easy things. That is the way to cheap victories, which are worthless. The way to get a habit of victory worth having is to win hard victories.

Many years ago a friend of the writer remarked to some one who said he should like to be a fast walker, that if he always walked as fast as he could, he would discover by and by that he was in the habit of walking fast. The constant effort to put forth all the force of one's body or mind develops the capacity to put forth a great deal more strength than one had been supposed to possess, or would otherwise have had; and after the habit is once acquired it becomes an easy matter to use that strength.

Most people are quite unaware how far they are from doing what they are capable, or would become capable, of doing; and few men exert themselves to the utmost in everything they are called upon to do. Yet that is one of the secrets of success. The other is in being fully prepared.

Caesar's tenth legion did not go into battle with their swords dull. The preparation for a contest is half the victory. Many an inferior lawyer has won his case by knowing the facts better than his more brilliant opponent. The mastery of all that can be known about a question is tedious, and less attractive than trusting to clevernes and luck; but it is the foundation on which success is built. If you prepare yourself for anything you are called upon to do as if you meant to succeed, no matter how strong your antagonist may prove, or how great are the obstacles to be over-

Ladies, Make Your Own Skirts

The Efficiency Skirt Cutting System includes a patented appliance that makes it the most perfect skirt cutting system in the world, and so simple that a child can use it. It pays for itself with one using. Write for particulars.

The Cultivator Poultry Book

Poultry for Profit

By Jean A. Koethen

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary, and disastrous obstacles are overcome. The author is a graduate of the University of California and a contributor to the columns of the California Cultivator, with years of practical experience in breeding in California.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

come; and if, when the decisive moment comes, you put forth every ounce of force that you possess—whether that particular object seems worthy of the effort or not—you will live to hear your friends say that you are a far stronger man than they supposed you to be. You will discover some day that you have acquired the habit of victory.—Youths' Companion.

TO HIS MOTHER

In France the relation between a son and his mother is very sweet and tender. Even the boys of the least cultivated class show an almost invariable courtesy and unselfishness to their mothers.

I was in Paris during the first two months of the present war, writes Mrs. Lillian Hayden Hieston to The Youths' Companion, and a woman who worked for me spoke often of her only child, a boy, who was in one of the very first regiments ordered to the front. I have never seen anything so sweet as the letters he wrote to her to allay her fears. The last of them ran as follows; I borrowed it of her that I might copy it. In translating it literally I have kept much of the charm of the original:

"Little Mother So Dearly Loved: Thy boy is gay and joyous as the birds that sing. Dost thou hear that, little one! Thou must not worry, not in the very least, my mother. Indeed thou canst not imagine how happy we have been nor what delicious things we have to eat. We caught a rabbit to put in our stew and we found potatoes in a field. Thy boy grows fat, my mother! Why shouldst thou worry? Thou must not mourn when we are laughing. Give to all the friends my loving greeting, and thou, dear heart, look not for letters. It is so seldom that we can write. Remember that I am safe and that I love thee.

"I send thee a thousand kisses and I am thy son."

This letter, sent to the mother by a comrade of her son, had been written on a scrap of paper with a pencil while he was in the trenches before the engagement in which he lost his life. He said nothing of the horror of the bloodshed, nothing of his own weariness and dread, nothing of the agony and cruelty and death that he had seen. He wrote only of what he knew would reassure and comfort her.

The letter did strangely comfort the lonely, sorrowing mother. It made her forget the war anl think of her boy as a gay and laughing child again. There had been no funeral. She had not seen him dead. These joyous written words were far more real to her than what she knew of his death. His loving thought had lifted her into that realm of the spirit in which there is no death.

THE LONGEST PRICE OF WAR

There is a fact of life called heredity which plays a dreadful part in determining the longest price of war. According to the laws of heredity we are all largely dependent upon what our ancestors were for what we can be; consequently, the future of any race depends upon the quality of those who become its fathers and mothers. That is true not only of human beings, but of all living things.

Some have found in this theory an argument for war; they maintain that since life advances by struggle and survival, strong nations must crush weak ones if the future of mankind is to be strong. None of the champions of war who declare that peace corrodes and ruins nations have thought about the matter deeply enough to learn that the argument they quote is the most fatal of all to their own horrible creed. For the truth is that war brings about "reversed selection"—in which the best are chosen to be killed and the worst are preserved to become the fathers of the future.

Rome and France furnish illustrations of this awful truth. The greatest empire of the ancient world was Rome. When she had conquered all her enemies she fell. Ever since then thinkers and historians have sought the reason. Today there are many who believe that it has been found. Rome was always fighting. She had far and wide frontiers, which must ever be defended. The defense needed the best men she had, and got them. A great German historian, Professor Seeck, says that in Rome, out of every hundred thousand strong men, eighty thousand were slain, and that out of every hundred thousand weaklings ninety to ninety-five thousand were left to survive. The Roman Empire perished for want of men, says the great English historian, Sir John Seeley; and when the living foundations of empire thus decayed, all the rest came down with a crash. The descendants of the vigorous race that had conquered the known world spent their time in shouting for "bread and games." The laws of heredity were not at fault; the vigorous, in fact, had died, and it was the rejected, those unfit to be Roman soldiers, that stayed at home and became the Roman fathers of a nation whose course was run.—Dr. C. W. Saleeby, in the Youths' Companion.

"SILVER OLD AND SILVER NEW"

Every housekeeper takes pride in keeping her silver bright and shining, whether her choicest collection be great grandmother's treasured teaspoons or the latest achievement of the jeweler's art.

But whether her silver is of this year or of a century ago, the sulphur in eggs, rubber, natural gas, water, white tissue paper, and in the white cloth, so often used in making silver cases, will turn the best polish she can put on it, to a yellowish brown.

To clean by rubbing with whiting or any of the silver polishes is a long and laborious process, and one which must be repeated frequently, but an easier method, which does not injure the silver, may be employed.

Dissolve one teaspoon of common salt and one teaspoon of soda in one quart of water, and place in a galvanized pan. Silver placed in this solution takes on a polish without rubbing. To get results it is necessary to keep the inside of the pan thoroughly clean.

By placing in the solution a small piece of zinc or the lid of a Mason jar the use of the galvanized pan becomes unnecessary and any kind of a pan may be used.—Mary L. Oberlin, Colorado Agricultural College, Fort Collins.

THE THREE P'S

Einstein, wishing to buy a motor car, consulted a friend as to the merits of the different makes of machines. "There are," said his counselor, "three first-class makes. Buy a Peerless, a Packard, or a Pierce Arrow. Any one of them is first-class. Just remember the three p's and you can't go wrong." A few days later Einstein appeared in that exhilarated condition always observable in a man who has bought his first motor car or a woman who has achieved the purchase of a hat. "It's all right," he said. "I took your advice. I remembered the t'ree p's. I got a Puick."

BOOKS

Precious and priceless are the blessings which books scatter around our daily paths. We walk, in imagination, with the noblest spirits through the most enchanting regions—regions which, to all that is lovely in the forms and colors of earth,

"Add the gleam,
The light that never was on sea or land,
The consecration and the poet's dream."

—E. P. Whipple.

IT REMOVES STAINS

"Alcohol," says an exchange, "will remove stains from summer clothes." That is true, but it also removes the summer clothes, also the spring, the autumn and the winter clothes, not only from the one who drinks it, but from the wife and family as well. It removes the household furniture, the eatables from the pantry, the smiles from the face of his wife, the laugh from the innocent lips of his children, and the happiness out of his home. As a remover of things alcohol has no equal.—Boys' World.

If you mix cornstarch or flour with sugar before adding it to your pudding it will not be necessary to mix it with milk or water first as is usually the method.

ELECTRIC LIGHT

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Fruit
Cereal with Dates Cream
Baked Eggs Hot Rolls
Coffee

Lunch or Supper

Canned Salmon Reheated Egg Sauce
Mashed Potatoes Beet Greens
Cornbread
Coffee Custard Tea

Dinner

Kornlet Soup
Lamb Chops French Fried Potatoes
Artichokes, Drawn Butter
Apple Fritters
Orange Cake Coffee

Baked Eggs

Butter as many muffin rings as will be needed, break into each an egg, salt slightly, pour over each a spoonful of cream and bake until the whites are set.

Coffee Custard

Two cups milk, two tablespoons ground coffee, three eggs, one-fourth cup sugar, one-eighth salt, one-fourth teaspoon vanilla. Scald milk with coffee and strain. Beat eggs slightly, add sugar, salt, vanilla and milk. Strain into buttered individual moulds, set in pan of hot water and bake until firm. Serve with cream.

Apple Fritters

One cup flour, one-fourth teaspoon salt, two-thirds cup milk, yolks of two eggs, whites of two eggs, one tablespoon melted butter, two medium sized apples. Mix salt and flour, add milk gradually, yolks of eggs beaten until thick, and butter. Stir in two medium sized apples sliced thin and lastly fold in the stiffly beaten whites of eggs.

Orange Cake

One-fourth cup butter, one cup sugar, two eggs, one-half cup milk, one and two-thirds cups flour, two and one-half teaspoons baking powder. Cream the butter, add sugar gradually, yolks of eggs well beaten, and milk. Then add flour mixed and sifted with baking powder. (Do not pack flour in cup or the mixture will be too stiff.) Lastly fold in stiffly beaten whites of eggs. Put together with orange filling and ice with orange frosting.

Orange Filling

One-half cup sugar, two and one-half tablespoons flour, grated rind one-half orange, one-fourth cup orange juice, one-half tablespoon lemon juice, one egg slightly beaten, one teaspoon butter. Mix ingredients in order given. Cook ten minutes in double boiler, stirring constantly. Cool before spreading. If too thick, add more orange juice or a little hot water.

Orange Frosting

Grated rind one orange, four teaspoons orange juice, one-half teaspoon lemon juice, yolk of one egg, confectioners' sugar. Add rind to fruit juices, let stand 15 minutes. Strain and add gradually to yolk of egg slightly beaten. Stir in confectioners' sugar until of right consistency to spread.

Note: The recipes given call for level measurements.

When mother lets us scrape the bowl,
after the cake is done,
We take it out into the yard, and sit
down in the sun,
Where we can see to get it all—because it goes so soon!
She doesn't have to wash it when we
clean it with a spoon.
Sister's a little thing, but my! her
spoon goes awful fast!
I got the first scrape, but I'm scared
she's going to get the last.
Well, anyway, when we're grown up,
all big, and old, and tall,
We are going to make a cake to eat—
and not to cook at all.
—Charlotte Wilson in Today's.

OUTWITTED

He drew a circle and shut me out—
Heretic, rebel, a thing to flout.
But love and I had the wit to win:
We drew a circle that took him in.
—Edwin Markham.

Try this New Blackberry At Our Expense

TO CULTIVATOR SUBSCRIBERS ONLY—To have this New Macatawa Everbearing Blackberry tested in as many localities as possible, claiming it to be the sweetest and best table berry on the Coast, the propagators of this berry have made us a proposition for supplying same in shipments of 6 plants each by parcel post, all charges paid.

Their description of the Macatawa is as follows: "It is a cross between the true Giant Himalaya and the Eldorado. The fruit is very large and sweet, in fact, it is the sweetest blackberry grown. It is coreless and almost seedless; very solid, jet black when ripe and can be shipped 1000 miles without bruising. The shape is oblong, very uniform, averaging three and one-half inches around one way by three and one-fourth inches the other way. The bloom is almost semi-double, about the size of a silver dollar. So far all who have tested this berry say it is the sweetest and best flavored berry they ever tried."

DO YOU WANT SIX OF THESE PLANTS? If so send in the regular subscription price for one year's subscription to the Cultivator, new or renewal; add 25c to cover cost to the nursery of postage and packing, and the six plants will be carefully packed and mailed you promptly without additional charge.

REMEMBER—The regular price of the 6 plants alone is $1.00 postpaid. Only one shipment will be made to a customer, but subscriptions and plants may be sent to different addresses.

HAY

Under date of February 20, Scott, Magner & Miller say:

Receipts of hay for the past week were 3250 tons, the previous week 2164 tons. The market continues about the same with no change to speak of. Conditions at the present time for large crops are very good. Fancy hay, either wheat or red oat, continues to be the only commodity in demand. Alfalfa offerings are heavy but demand is light.

There is practically no market for straw at present.

Citrus Fruit Market

LOS ANGELES, Feb. 24, 1915.

The orange market is in fair condition the only marked feature is the quantity of decayed fruit which is showing up mostly due to wet weather. Good fruit moves off pretty fast.

Not much doing in lemons. Shipment

are very light, as is usual at this time of year. The fruit is being held here until warmer weather in the East brings better demand. Heavy shipments will start as soon as conditions warrant.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 6610 cars, lemons 997, total 7607; to same date last season, oranges 6962, lemons 461, total 7423. From Tulare County this season, oranges 5071, lemons 141, total 5212; to same date last season, oranges 4370, lemons 28, total 4398. From Butte County this season, oranges 591, lemons 1, total 592.

NEW YORK, Feb. 23.—Forty-three cars navels, six mixed and two cars lemons sold. Market 10 to 15c lower on navels, market 10c higher on lemons. Fair and warm.

THE PANAMA-PACIFIC

(Continued from Page 227)

use some of those superlatives, so I pass on to talk about hogs.

There aren't any hogs on the grounds, excepting a few used in demonstrating a feeding appliance. Cows, horses and all other stock are yet to come. The live stock buildings are ready.

Many of the exhibits are incomplete. Many are not yet received. The United States government exhibits—they are in almost every building, and very extended—are practically all complete. Japan is in almost every building and nearly all complete. France has signs in all her spaces that exhibits are on the way. Machinery Palace is perhaps most nearly complete and Education the least so.

There are twelve of these great exhibit palaces: Machinery, Varied Industry, Manufactures, Liberal Arts, Education, Fine Arts, Food Products, Agriculture Transportation, Mines, Horticulture and California. Then the Great Festival Hall with scores, almost hundreds of other great buildings of nations and states.

The street railways are wonderfully fitted to handle the crowds. Ferries take a very few. Jitneys by hundreds aid, but some of them charge 10 cents and some, when crowd was thickest, charged 25 cents.

A few of the hotels here violated their agreement and raised rates. A visitor should know what he is to pay before he takes a room. Restaurants are giving good service and as far as I have observed, at no material advance. The hotel men say that with the awful crowd one should be content to get a room at any price and refer to the fact that from Southern California alone over 10,000 people came to the opening. I still do not see where increased charges made it possible to entertain any more. When San Francisco agreed to entertain the world she agreed to do it in the true California spirit and on the square. She needs to call some of her hotel keepers. But bar the few petty things which are not as we wish.

It's a great exposition. It's an education. It's a wonder. All California is proud of it. It is a great honor to San Francisco, to the state and to the nation.

A new catalog of silos that ought to be in the hands of every reader of the Cultivaor, if he has a silo or is at all interested in one, has been received at this office. The catalog is issued by the Redwood Manufacturing Company of San Francisco and gives descriptions of their Remco silos, also instructions to users of the silo. The most important feature of the catalog is the instructions for erecting silos, with illustrations showing them in various stages of completion. We understand that the catalog will be sent free to readers who will write to the Redwood Manufacturing Company, San Francisco, mentioning the Cultivator.

Referring to a query sent from Florida some time ago regarding control of the common field rat, we asked for experience in California and a subscriber refers to Chubuck's Ideal Gopher trap as being exceptionally fine for controlling this particular pest.

"Jackson MADE"

The greatest test of any pump is its ability to raise the maximum amount at lowest cost per gallon, day in and day out, year after year.

True pumping economy is one of the great features of "Jackson Made" pumps; they work economically and their freedom from repairs and power saving pays their original cost in a few months.

If your pumping puzzles you, tell us—our expert engineers are at your service free of charge.

Write for Catalog No. 48A

A Better Make Not Made

"Jackson Made" pumps are manufactured in various styles to do your particular work at lowest possible cost.

how much will plowing cost?

Let's do a little arithmetic.

With a piece of paper and a pencil, figure out what it costs to pull your plows each season.

Make a list of the following items and put your own figures opposite:—number of horses used; their cost; cost of feed; cost of harness; number of men required to care for and drive them; their wages; horses disabled and cost of veterinary services.

So much for maintenance.

THE YUBA BALL TREAD TRACTOR

For production from the horses, figuring their actual time spent in hauling the plows, list:—number of hours in working day; number of working days in week. Deduct from that the number of minutes in an hour it is necessary to rest each team. The cost of the horses' time and that of the driver, who must also rest, even if he isn't tired, is a dead loss.

Pretty expensive, isn't it?

This booklet, entitled "The Yuba Ball Tread Tractor," shows a way to haul plows at only a fraction of that cost.

For the sake of convenience, use the coupon.

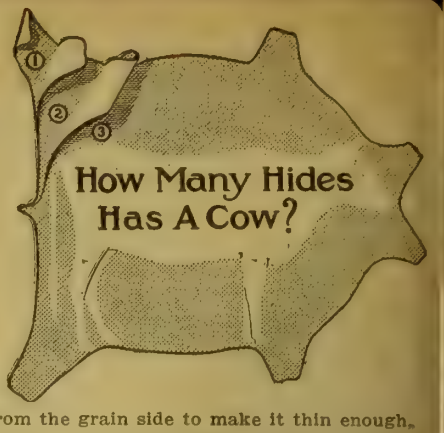
The Truth ABOUT Leather



IN a recent defensive circular to the auto trade, leather manufacturers define leather as "the skin or hide of an animal, or any part of such skin or hide, tanned or otherwise prepared for use."

But since whole hides are too thick for upholstery and the under fleshy portion must be split away from the grain side to make it thin enough, why should the two or three sheets into which the wastage is split, be called leather? Although artificially coated and embossed to look like real grain leather, they are weak, spongy, and soft, crack, peel and rot.

DU PONT FABRIKOID REG. U. S. PAT. OFF.

MOTOR QUALITY
FOR AUTOMOBILES
CRAFTSMAN QUALITY
FOR FURNITURE

is frankly artificial leather, guaranteed superior to coated splits. Its base is cotton fabric, twice as strong as the fleshy split. It is coated much heavier and embossed in the same way.

America's largest auto makers adopted it for upholstery because it outwears coated splits.

That foremost furniture maker, S. Karpen, says: "The cheap split leathers should be entirely eliminated in furniture upholstering."
Two-thirds of all "leather upholstery" is coated splits. Demand superior Fabrikoid on your car, buggy or furniture, and Fabrikoid Rayntite tops, guaranteed one year against leaking.

Small Sample Craftsman Quality Free

California Draft Horse Breeders Sale

Large Attendance Given to First Sale Which Was Held at University Farm at Davis on Wednesday, February 24. Bidding Rather Slow but Enough Sales Made to Encourage Industry. Prices Moderate.

THE California Draft Horse Breeders' Association's first sale was a success. The prices were not big, all the horses were not sold, but taken all in all we believe attention has been called to the draft horse industry in a way which will prove beneficial.

The day opened with a heavy rainfall but before time for the sale the clouds cleared away and the sun was shining. The crowd filled the big stock judging pavilion at the university farm at Davis and it really looked as if there would be spirited bidding. The highest price reached was by Salvador Forest King, a magnificent Shire, which commanded an even thousand dollars. One colt sold as low as $100, but the sales usually ran from $300 to $600. Considering the depressed financial condition the country over perhaps these prices are as high as could be expected, yet the draft made upon American horses by European war conditions is stimulating the horse industry to such an extent as to naturally encourage keen bidding when such an opportunity is offered. The association issued a beautifully printed catalog, giving some illustrations and a list with full pedigree of all horses offered at the sale. The auctioneer was Mr. Higginbottom. From a statement made by the association in the introduction of the catalog we quote:

"While California is not producing enough high class draft horses to supply the demand of its cities for such stock, there still seems to be a feeling of uncertainty in some quarters as to the future of draft horse breeding as a business in the state. The advent of the mechanical tractor as a competitor of the horse for certain kinds of draft and the question of the probable extent to which this machine may be used in the place of the horse is responsible in part for this attitude.

"Be this as it may, the demand will never be less imperative that heavy horses offered for sale be sound and of the big handsome, free-moving type that has always commanded high prices in our cities, even when the cheaper sorts found no market.

"In order to breed such heavy market horses with a degree of certainty the best pure bred draft stallions must be used. It is important, especially at times like this, not only that the best breeding animals be used but that stallion owners be able to buy their horses at reasonable prices. The breeders of pure bred draft horses in California have every confidence in the future. They feel, however, that they and those who should be their customers, should get closer together, that their dealings should be direct. They are, therefore, offering at public sale the horses and mares listed in this catalog in the hope and with confidence that this first consignment sale will mark the beginning of a new epoch, not only in the marketing but in the breeding of draft horses in California."

Sales were as follows:

Imported Belgian stallion Noirhat Docteur, consigned by Mrs. Virginia Gibson, bought by Elmo Montgomery, Davis, $300.

Belgian stallion Hamilton C., consigned by H. L. West, bought by M. and J. Williams, Concord, $685.

SOME ATTENDANTS AT THE DRAFT HORSE SHOW

Top picture, left to right: D. Gibson, Williams; H. R. Timm of Timm's Certified Dairy, Dixon, and H. C. Stovall, Willows. Center: Henry Wheatley, Napa, president of the Association; Wm. Higginbottom, auctioneer, and Prof. J. I. Thompson, secretary of the association. Bottom, left to right: H. S. and A. L. Landis, Sacramento; G. W. Watson, Napa Junction; H. L. West, Hamilton City, and G. A. Waugh, Chico.

Belgian stallion California Chief, consigned by H. L. West, bought by C. Harris, San Francisco, $600.

Belgian stallion Nebraska Chief, consigned by Frank S. West, bought by W. Fine, Millville, $300.

Belgian stallion West's California Chief, consigned by Frank S. West, bought by Del Grieves, Davis, $100.

Belgian mare Christine, consigned by Frank S. West, bought by Del Grieves, Davis, $155.

Belgian mare Chrystabel, consigned by Frank S. West, bought by Dion Gibson, Williams, $250.

Shire stallion Salvador Forest King, consigned by Henry Wheatley, bought by E. W. Westgate, Rio Vista, $1000.

Shire mare Salvador Rose, consigned by Henry Wheatley, bought by John McCormack, Rio Vista, $475.

Shire mare Salvadore Rose, consigned by Henry Wheatley, bought by Dr. C. M. Faris, Sacramento, $195.

Percheron mare Adalaide, consigned by Oliver P. Jenkins, bought by Wm. McLaughlin, Emeryville, $290.

Percheron mare Phoebe, consigned by Oliver P. Jenkins, bought by Wm. McLaughlin, Emeryville, $290.

Percheron stallion Pago, consigned by Winters Breeders' Association, bought by C. Harris, San Francisco, $500.

Imported Percheron stallion Gallipali, consigned by Parrott Investment Company, bought by Dr. C. M. Faris, Sacramento, $550.

Percheron stallion Chico, consigned by Parrott Investment Company, bought by A. Oure, R. R. 5, Sacramento, $600.

Four fine stallions, three Percherons and one imported Shire, were not sold.

California Federated Agricultural Associations

Enthusiastic Meeting at Exposition Grounds, San Francisco, on Washington's Birthday, Takes Steps to Form an Organization Which Should be a Great Factor in Agricultural Welfare

A movement which originally contemplated working only in the interests of fruit growers has progressed until the question is now asked—and we believe being answered in the affirmative—"May not its scope be enlarged to include agriculture in all its phases?" This movement is the result of a motion made at the State Fruit Growers' convention, held in Los Angeles in November. At that time a committee was appointed to report as to the advisability of forming a State Fruit Growers' Association to work with the state horticultural commissioner. The committee went somewhat farther than the motion contemplated and reported two separate types of organization back to the original convention for its approval. The convention adopted the report entire, though it expressed belief in the desirability of the larger and more inclusive organization; that is, an organization which should federate all the agricultural interests of the state. A committee was appointed which later met in Sacramento and unanimously favored the larger convention. This committee created by the State Fruit Growers' convention felt it did not have power to proceed in the formation of a larger organization without consulting other interests. To that end an invitation was extended to various state organizations to send representatives to a meeting which was held at Inside Inn, Exposition Grounds, San Francisco, on Washington's birthday. At that meeting there were representatives of some fifteen state associations. There were several representatives of the State Beekeepers' Association, California Wool Producers' Association, Live Stock Breeders' Association, Agricultural Exhibitors' Association, Farmers' Union, Marketing Committee of the Outlook Association, Farmers' Protective League, State Dairy Association, State Creamerymens' Association, San Joaquin Valley Water Problem Association, and others.

There was a feeling on the part of some that an association now existing might answer the purpose, instead of organizing a new one. This was particularly true of friends of the Farmers' Protective League, organized during the campaign when the eight-hour bill was before the people. The work of this league was well done at that time. We believe, however, the majority of those attending the meeting at Sacramento are in favor of forming an entirely new federation, one in which there shall be no salaried officers and in which the administration expenses shall be as low as possible, this for the sake of making its memberhip general.

Some growers have felt that possibly the ambition of the association was to take the place of existing organizations. We do not think this has been contemplated by anyone, and if it should be it would certainly be a great error. The idea is rather that it shall be an inspiration to greater membership of all the existing organizations of the state which have for their object the bettering of cultural and marketing conditions. In fact, that is the reason which inspires the work for this federation. There are today many organizations which feel the need of more general support.

Citrus and Tropical Fruits

RESULTS OF EXPERIMENTS WITH CITRUS STOCKS

By Prof. W. W. Bonns Before State Fruit Growers

A SHORT time ago members of the citrus experiment station staff had occasion to visit a nursery in Southern California where sweet and sour orange stock was being grown. An examination of about 1000 trees of the sweet stock showed 29 per cent by actual count affected to some degree with gum disease. Not one case of gum disease was found among the sour stock in a similar examination.

Last spring we set out a seed-bed of many thousand seeds of sweet orange, sour orange, trifoliate orange, pomelo, and rough lemon for the purpose of growing stock for a more extensive stock experiment on the proposed new station site. Shortly after the time of planting and continuing up to the time that the seedlings were attaining their first growth, the seed-bed was attacked by a soil fungus, rhizoctonia. As a result of this fungus invasion we lost about 70 per cent of the sweet seedlings, 60 per cent of the trifoliate, 40 per cent of the sour, 30 per cent of the pomelo and probably not more than 1 or 2 per cent of the rough lemon.

Professor Fawcett has shown beyond any reasonable doubt that sour stock, when directly inoculated with certain fungi by artificial means, has an inherent constitutional resistance to the spread of the disease, when compared with the severity of the attack which sweet stock experiences under similar conditions.

Now this question of resistance to disease is only one of several factors that enter into the question of the stock to use in propagating citrus fruits. We have dwelt upon this because it shows in a striking manner the differences in behavior to be expected of various stocks. But this is only one aspect of the problem. As we pointed out at the first horticultural assembly a year ago, the question of resistance to drouth, hardiness in respect to cold and to unfavorable soil and water conditions, are also of prime importance. In addition there should be determined the type of soil best adapted for the root development of the respective stocks.

In considering these points with respect to the roots there must also be taken into consideration the effect of the development of the variety grown upon them for commercial purposes What will be the effect of the stock upon the size and vigor of the trees produced, upon the age in which they come into bearing, the yield, and their period of maximum efficiency? Again, will there be any difference in respect to the points just mentioned when the same variety is budded to the same stock in a different soil type?

An attempt to answer some of these questions was begun at the citrus experiment station about eight years ago, and it was my purpose in the brief time allotted me today to summarize for you the results obtained to date.

The experiment is divided into three plots, the main difference being that of soil conditions. Plot A has at present 49 trees, consisting of Washington navel on sweet and trifoliate, Valencia on sweet, sour, pomelo, and trifoliate, and Eureka lemon, the same as Valencia. The soil on this plot is a light, deep, granite loam or uniform character.

Plot B comprises in all 164 trees. The navels here are on sweet, sour, and trifoliate, and the Valencias and Eurekas in addition to these roots are also on pomelo. This plot, although set in one piece, has been divided into two sections, in determining the data which is to follow, because of the differences in soil conditions obtaining in the two areas. The top soil is similar in both. It is of a somewhat heavier type than that in Plot A, being on the clay loam order. That portion of Plot B which we have characterized as deep is underlaid by a pervious, sandy loam. The other portion of B is very shallow and is underlain by hardpan of the most decided character. The top soil of this latter area has been mapped and the depth has been found to vary from 15 inches to a little over three feet. Manifestly we might expect different results from these differences in the subsoil conditions, nor would it be fair to take an average of the different varieties on the different plots from the sum of the two. We have therefore designated Plot B as B Deep and B Shallow, and have determined the data for each separately.

The trees in both Plots A and B were set out in April, 1907, as two-year-old buds of about one inch caliper and were obtained from one nursery. They have received uniform treatment in respect to fertilization, cultivation, irrigation, and covercropping. The trees are set in variety blocks, the respective stocks forming separate rows.

The results which we submit are two-fold in nature. They indicate the productiveness of the trees on the respective stocks to date and the vigor of the same as indicated by their size. The production is given in terms of the average number of pounds of fruit per tree for an average of five years for the navels and Valencias, and three years for the Eureka lemons, inasmuch as the injury effected by the winters of 1911 and 1913 precluded the possibility of lemon crops for the succeeding seasons.

It will be readily seen that the yield per tree is exceedingly small, but we must bear in mind that these five and three-year averages embrace the years when the trees began to bear their first fruits and that the present data is in no way a criterion of the performance of the trees at the present time or of their possibilities in the future. In does however furnish comparative data for discussing the different varieties upon the different stocks under similar conditions, and the yields have been arranged for this purpose.

TABLE I

Five-Year Average Production per Tree in Pounds. (For Lemons, Three-Year Average.)

	Sweet	Sour	Po-melo	Tri-foliata
Plot A				
Navel 35				22
Valencia 57	41		54	51
Eureka 11	17		28	15
Plot B Deep				
Navel 22	30			24
Valencia 28	33		34	49
Eureka 7	8		6	7
Plot B Shallow				
Navel 12	18			14
Valencia 25	22		13	16
Eureka 7	5		5	6

In Plot A the navel yield on sweet is considerably larger than on trifoliate. For Valencia sweet ranks first, with pomelo and trifoliate a close second and third, respectively. Sour has been the least productive. For Eureka lemon pomelo has given the greatest yield, sour second, trifoliate almost as good as sour, and sweet is last.

In Plot B Deep, navel on sour is first, trifoliate not far behind, and sweet a close third. On the other hand Valencia on trifoliate leads in this plot by a considerable margin, producing almost twice as much fruit as sweet, almost one-third more than the variety on sour or pomelo. For the lemons sour leads, with sweet and trifoliate tied for second place and pomelo last.

In Plot B Shallow, the yields are naturally much reduced. Sweet stock again holds first place for navel, sour second, and trifoliate third, but with little difference between the last two. Valencia in this case has done best on sour, almost as well on sweet, and

trifoliate has given better yields than pomelo which is last. Eureka lemon on trifoliate ranks first, sweet second, sour third, and pomelo fourth.

So much for fruit production. Let us consider briefly the comparative vigor of the trees as indicated by their size. The most uniform method of determining this seemed to be with the fumigation tent. Each tree in the experiment was covered, and the usual dimensions for determining cyanide dosage taken. These figures substituted in a formula, originally deducted by Prof. C. W. Woodworth of the University of California, and later amended by Mr. R. S. Woglum of the United States department of agriculture, have given us the volume of the trees under the tent in cubic feet.

TABLE II

Average Volume of Tree in Cubic Feet. Planted 1907, Measured, 1914

	Sweet	Sour	Pomelo	Trifoliata
Plot A				
Navel	1061			695
Valencia	1128	788	1112	819
Eureka	1434	1032	1270	199
Plot B Deep				
Navel	583	551		525
Valencia	790	592	730	786
Eureka	998	698	693	164
Plot B Shallow				
Navel	420	440		341
Valencia	676	499	577	335
Eureka	807	713	378	167

In Plot A navel on trifoliate is about 30 per cent smaller than the variety on sweet. In the case of Valencia the average size of the trees on sweet and pomelo is practically equal, and trifoliate exceeds sour by a small margin. Eureka lemon on sweet is somewhat larger than on pomelo, sour ranks third, being about 200 cubic feet smaller, and the trifoliate root has dwarfed the tree tremendously.

In Plot B Deep, there is very little difference in the size of the three stocks on which navel is budded. In the case of Valencia it is interesting to note that the size of trees on sweet and trifoliate are for practical purposes equal; while trees on sour are the smallest of all. In Eureka we again see the characteristic marked dwarfing of the trees on trifoliate. Those on sweet stock are again the largest, and in this case sour ranks second and pomelo practically equal to the latter.

In Plot B Shallow, navel on sweet and sour run very nearly equal, with trifoliate third. For Valencia the order of size is sweet, pomelo, sour and trifoliate, and for Eureka lemons, sweet, sour, pomelo, and trifoliate.

One of the most striking facts of this experiment is the very decided increase of the size of the stock about the ground wherever trifoliate root has been used. The result of growing a large tree upon a root system which is naturally small, like the trifoliate, and which in its normal conditions is not accustomed to developing a large tree, seems to result in a stimulus which increases the size of the stock markedly.

This account is intended to be a progress report, pure and simple. Definite conclusions at this stage of the work would be unwarranted and unsafe. We must remember that these results represent only the first half of the first decade of this experiment. The trees have only begun to indicate what they may produce in the future. The points to which we would call attention, however, are, that the reputation of the trifoliate stock for dwarfing the tree does not hold good for all soils or all varieties. We have seen here Valencias on trifoliata producing as well and growing a tree as large as, or larger than, those on other stocks. Also we may note that the behavior of the same stock and variety varies on the light and the heavy soils. One thing seems unmistakable, and that is that trifoliata root dwarfs the lemon to a very great and undesirable degree.

CITRUS CANKER

Bulletin 124 of the University of Florida agricultural experiment station is probably the most complete statement of the fearful results of this disease yet made. In it we note several illustrations, one of which shows the burning of infected nursery trees, another of an infected orchard. An appliance similar to an ordinary spray pump is used to spray a flaming mixture of kerosene and crude oil upon the tree, upon the grass and the soil underneath, until there is no possibility of infection left. It has been found that practically the only safe method of treating this dread disease is absolutely burning up leaf, tree and even the soil. California may well continue its rigid quarantine against any such a pest. Florida is making a brave fight and we trust will succeed in wiping it out.

Oiliness

Without "oiliness" any lubricant would be worthless. You can *feel* the oiliness of Zerolene by pouring a little on a piece of glass and rubbing it around with your finger. Oiliness is in reality the molecules of the oil rolling over each other—miniature ball bearings as it were. Thus when you use a *good* oil like Zerolene the wearing surfaces of your engine roll over these "ball bearings" instead of rubbing together. Dealers everywhere.

Does It Pay to Raise Apples ?

Go to the nearby store, get the prices of first-class apples—

"The Big Red Apple"

the kind grown in the Yucaipa Valley—and figure whether growing the king of fruits is a paying proposition. After doing so write the **Redlands & Yucaipa Land Co.** and get printed matter explaining fully the best apple, pear and peach land in California. Or come to Redlands and let us take you to Yucaipa and show what we have.

Yucaipa is 2400 to 3000 feet above the sea, eight miles from Redlands. Land is selling at $285 per acre, on easy terms, one share of water stock in a Mutual Water Company goes with each acre. This is the time of year to plant deciduous fruits.

Redlands & Yucaipa Land Co.

DIKE & LOGIE, General Sales Agents

209 Orange Street REDLANDS, CAL.

I Want to Show You This 40 ACRE EQUIPPED FARM

LAND: Level, clean, strong; no brush or stumps; ready for plowing; between two railroads and within 1½ miles of stations on Southern Pacific and Western Pacific. In the Upper Sacramento Valley.
SOIL: Deep San Joaquin loam.
WATER: Unlimited water at 20 to 25 feet.
EQUIPPED: with a plow, a harrow and a cultivator, a pumping plant complete, trees and seed.
SPECIAL: This land is absolutely above all flood from rivers; the titles are clear and guaranteed; there is no bonded indebtedness; there are no reclamation or irrigation assessments. This is clean, strong land without incumbrance of any kind.
THE PRICE is $150.00 per acre with equipment, or $125.00 for the bare land. Terms, ¼ cash, balance 6 equal annual payments, 6%. I want to show you this specially selected piece of land.

Deciduous Fruits

FOUNDATION STONES FOR SUCCESS IN AGRICULTURE

CONTINUING the series published in the Cultivator of February 4. In these brief summaries different experts of the college of agriculture of the University of California have set forth the basic principles of their various specialties.

PRODUCTION OF FRUITS AND NUTS

By A. V. Stubenrauch, Professor of Pomology

The commercial orchard is a long time investment; careful attention to important details of management is therefore cumulative in its effects.

The factors underlying successful orcharding are proper soil conditions, favorable climate, and accessible markets.

Accessible markets mean efficient transportation service. Efficient refrigerator transportation service renders distant markets relatively more accessible than less distant markets without efficient service for carrying fruits in sound condition.

Temperature, rainfall, and winds are the governing climatic features in the production of fruits and nuts.

The occurrence of late spring frosts is frequently the limiting factor in the successful production of a particular fruit.

Almonds and apricots bloom early, hence sites which are free from late spring frosts must be selected for these fruits.

Direct sunshine is necessary for successful fruitfulness.

Some unfavorable conditions preventing successful growth of trees are: Shallow soil, hardpan near the surface, lack of drainage, presence of coarse gravel strata near the surface, presence of excessive alkali salts.

Thorough preparation of the soil is one of the elements of success in planting trees.

Thorough and deep tillage of orchard soils is an urgent necessity under California conditions of rainless summers.

Cover crops improve the physical condition of both light and heavy soils.

A leguminous cover crop has the advantage of both improving the physical texture of the orchard soil and adding a valuable plantfood—nitrogen—which it obtains from the atmosphere.

Early fall sowing of cover crops insures early growth and a maximum production of green stuff for plowing under in spring.

Cover crops can be profitably grown only during the winter rainy season in California; hence a crop which will thrive and grow during cool weather must be selected for this purpose.

Pruning is too important to be left to the caprices of ordinary farm labor.

The principles underlying the proper pruning of young trees are different from those governing the handling of bearing trees; in the one the training of the tree is paramount while in the other the control or regulation of fruiting habits is the governing factor.

OLIVE GROWING IN CALIFORNIA

By W. F. Oglesby, Assistant in Viticulture in the University of California

Olive varieties should bear good crops of large fruit, easy to pickle and ripening before heavy frosts.

Winter temperatures below 15 degrees Fahrenheit, spring frosts after April 15, and fall frosts before December 1 are dangerous.

Very hot or cold weather during blossoming, especially with wind, may reduce or prevent bearing.

Mean temperature from blossoming to ripening should average at least 66 degrees Fahrenheit.

The best soils require at least two acre feet of water; shallow or less retentive soils more.

Localities subject to frequent summer fogs are unsuitable for olives owing to the difficulty of controlling black scale.

Deep preparation of the soil is necessary for vigor and early bearing and promotes deep rooting.

Deep annual plowing in winter aerates and improves the soil.

Frequent cultivation during the growing season conserves moisture.

Irrigation must supply deficiency of rain or of retentiveness of soil. Except in the best soils it should be frequent toward the end of summer.

Cover crops or stable manure, or both, are essential for building up and maintaining the humus of the soil.

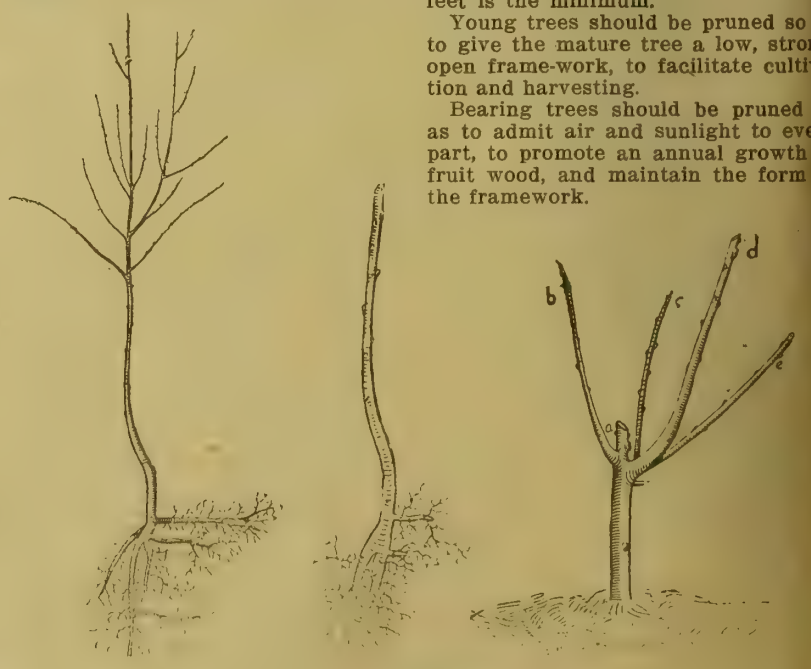
Suitable commercial fertilizers increase the productiveness of deficient soils.

Material for propagation should be selected from trees known to be good, regular bearers of choice fruit.

The richer the soil and the more vigorous the variety, the larger space needed by each tree; about 900 square feet is the minimum.

Young trees should be pruned so as to give the mature tree a low, strong, open frame-work, to facilitate cultivation and harvesting.

Bearing trees should be pruned so as to admit air and sunlight to every part, to promote an annual growth of fruit wood, and maintain the form of the framework.



Prune the Roots.

The tree as it comes from the nursery and as it should be headed at planting time. The tree to the right, however, shows by the stub at "a" that at planting time it was not cut "to a bud," or, if so, cut so close that it died back and started at next bud below. This stub should be removed and the cut wazed so that it will heal over. To use this tree would be nearer ideal if lower branch to the right were removed entirely and if the other three cut waxed so that it will heal over. To use this tree would be nearer ideal had at least one-half of their length removed. The roots should also be reduced and left with clean trimmed tips, as indicated in center illustration.

The only serious diseases and pests of the olive tree in California are the olive knot and scale insects. Where the former exists the more susceptible varieties should be avoided. Against the later, regular, open pruning is usually sufficient protection.

PLANT PATHOLOGY

By Ralph E. Smith, Professor of Plant Pathology

All plants are subject, in a varying degree, to what is called disease.

Disease is brought about by unfavorable soil or climatic conditions, by gross injuries, by parasites, and by some unknown influence.

The effects of such influences may be obscured, increased, or complicated by responses on the part of the plant itself of the nature of abnormalities in structure.

The species and variety of the plant affect its susceptibility to various diseases.

The condition of the plant has a similar, though less pronounced, effect.

Climatic, seasonal, or local conditions have a decided influence upon the prevalence of many plant diseases.

Disease may be prevented by destroying or avoiding its specific cause. Also in a measure by increasing the resistance of the plant by cultural means.

Also by choosing or creating varieties of plants which possess resistance to specific diseases.

IRRIGATION

By Frank Adams, Irrigation Manager, Office Experiment Stations U. S. D. A.

The application of more water than the soil will retain or than the crop irrigated requires is injurious to the soil and wasteful for both the individual and the state.

The purpose of irrigation is to get adequate moisture into the rooting zone of the crop irrigated and not merely to apply water to the soil surface. (Buy and use a six-foot soil auger and know what becomes of the water applied.)

Long irrigation furrows and long checks make even application of water impossible.

In orchard irrigation it is as important to irrigate directly in the tree rows as to irrigate between them.

Basin and flooding irrigation of orchards result in unnecessary puddling and excessive evaporation and may double the cost of cultivation after irrigation.

Orchards should be irrigated by means of furrows if you can get the water where you want it with furrows. (Use your soil auger to find out.)

The principal wastes in irrigation come through leaky farm ditches, run-off at the lower ends of furrows and checks, excessive application, resulting in too deep percolation, and surface evaporation due to too little or too shallow cultivation. (Look out for them!)

Plants require most water when they are making the most rapid growth.

Crops should be irrigated before they begin to suffer for lack of moisture.

The ideal in irrigation is, in general, to maintain uniform moisture content of the soil for lack of moisture.

Beyond a certain point the application of additional water does not increase yields and may decrease them.

WALNUTS IN SANTA BARBARA COUNTY

In the report of Horticultural Commissioner Beers of Santa Barbara County we note the following regarding walnut conditions in that county:

"The older walnut trees are being removed year by year to make way for new trees or to be supplemented by other plantings that offer greater attractions than walnuts. Where they are replanted to young walnuts we notice a very general practice is to plant trees budded to native black walnut, and this is encouraged, because we believe our native Southern black walnut offers a root stock superior in many respects to the natural English walnut. In addition the grafted trees give a more uniform nut and one that has already secured a higher market price.

"In the progress made with the disease Melazuma, that has become such a factor in the walnut industry, the experts have determined the genus of the fungus causing the disease. It is a well known fact with plant pathologists that a number of fungi have two stages of development, one of which is known as the imperfect stage, the other the perfect stage. In the laboratory work on Melazuma there has been determined an imperfect stage, as well as a perfect stage, of the causal agent of this disease. Research through the literature covering fungus studies in Italy discloses the interesting fact that the students in that country have discovered a fungus similar to the one under discussion, in that it is found on both walnut and willow, and this foreign fungus has both the perfect and imperfect stages of development. Our experts are not yet prepared to say that the fungus working in our walnut orchards is the same as that reported from Italy, but it is probably a related fungus. It is rather well established that the fungus with us is working on both walnut and willow.

"If it has its origin in our willows, then a safeguard would be to remove and burn all willow growth on the ranches, supplementing them with some more desirable tree or shrub. I would suggest planting the forage tree, the carob. Eucalyptus would surely be a great improvement over the willow."

GRAFTING WAX FOR DRESSING WOUNDS

There is an endless variation in the composition of dressings used from among the large number of substances available. Caution must be exercised in the use of gas tar, or coal tar, which contains certain chemicals injurious to the tissues of the tree. Pine tar is less objectionable, but much more expensive. Among the materials commonly used are the following: Resin, which gives the mixture body and hardness; beeswax, or tallow, which renders the resin less brittle and gives the mixture pliability; linseed oil, which makes the mixture softer and imparts drying and setting qualities. These three substances are the basis of the best dressings. If it is to be used hot, being kept melted over a fire, the following is suggested:

Resin	6 pounds
Beeswax	1 pound
Linseed oil	1 pint

By increasing or decreasing the proportion of resin to beeswax, we make the compound stiffer and more brittle, or softer and more pliable. By increasing the amount of linseed oil and adding a little alcohol and turpentine, at the same time reducing the amount of resin, the mixture remains fairly liquid when cold and can be used without the portable stove. Beeswax is expensive and may be displaced wholly or in part by tallow, but the resulting compound is not quite so good. The dressing can be prepared in large quantities in a kettle and reserved for future use. Too large a proportion of beeswax will make the mixture liable to melt and run down the trunks in hot summer weather.

Some injury was done by strong winds in El Dorado County last week.

QUASSIIN A CHEAP INSECTICIDE

Attention is called in a recent bulletin of the United States department of agriculture to the possibilites of quassiin as a contact insecticide. There is reason to believe, says this bulletin, that quassiin can be cheaply prepared and possibly sold at a lower price than some of the materials now used in commercial insecticides. The only experiments, however, that have been made up to the present were conducted at Sacramento and it is possible that in a more humid climate quassiin would not be so satisfactory.

Quassiin is the active principle in quassia wood which is found in considerable quantities in Jamaica. Quassia chips have been employed for many years in the preparation of spray solutions for the control of the hop aphis. The percentage of quassiin in these chips varies somewhat but it has been stated to be 75 per cent by one author. If this is correct, the bulletin says, it would take only one and one-half pounds of the chips to 100 gallons of spray to make an effective insecticide; three pounds or double this quantity would certainly be sufficient; and with three pounds of whale-oil soap at four cents a pound would make the total cost of materials for 100 gallons of spray only 24 cents.

In investigating the efficiency of the quassiin spray, the author of the bulletin compared it with a standard insecticide known as nicotine sulphate, a tobacco product. The quassiin he believes to be equally effective.

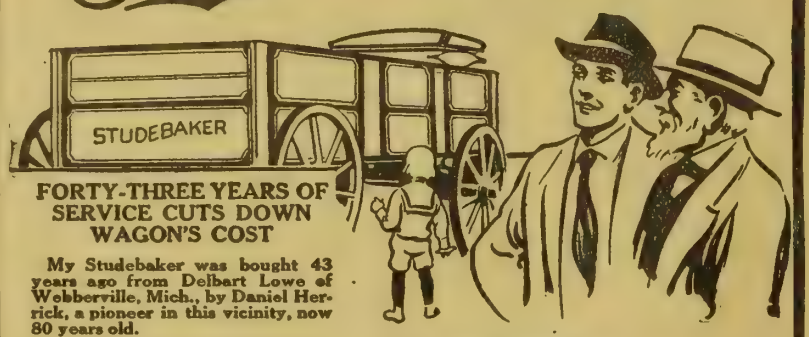
Studebaker

WAGONS BUGGIES HARNESS



FORTY-THREE YEARS OF SERVICE CUTS DOWN WAGON'S COST

My Studebaker was bought 43 years ago from Delbart Lowe of Webberville, Mich., by Daniel Herrick, a pioneer in this vicinity, now 80 years old.

In 1887, S. E. Dean bought the wagon from A. B. Herrick, Daniel's son.

Eight years ago L. C. Dean, son of S. E. Dean, bought the wagon from his father and still uses the wagon on his farm.

The wagon has stood out of doors for 26 years; a yard and a quarter of gravel can be drawn in it now.

Levi C. Dean,
R.F.D., Webberville, Mich.

A Studebaker that has served three generations—

FORTY-THREE years ago Daniel Herrick bought a Studebaker wagon. Mr. Herrick's son sold the wagon to S. E. Dean and Mr. Dean's son is using the same wagon on his farm today.

Think of the money that sturdy Studebaker wagon has made for every one of its four owners.

But that's the way with Studebaker wagons—they are a fine investment for they always pay dividends on the original cost.

Not the Cheapest but the Best

It is true a Studebaker wagon may cost you a few dollars more than a cheaply made wagon but when you consider the years of service you get from the Studebaker isn't it much the cheaper wagon in the end?

In fact, it is a safe proposition to judge your wagon by what it *costs you per year.*

Records prove that you can expect at least thirty-five years of service from a Studebaker. Figuring that way it is the cheapest wagon in the world.

Studebaker also makes Buggies and Harness warranted to give satisfaction.

NEWELL MATHEWS COMPANY

ESTABLISHED 886

LOS ANGELES AND MARKET STS. LOS ANGELES, CAL.

DEMING Farmers Friend Sprayers

are just the thing for keeping field, vineyard and orchard clean. Powerful enough to do lots of good work quickly and light enough to be moved around easily. Pump is well constructed, with every important part of easy access. The 50-gallon barrel rests on a hardwood platform, which is supported by strong iron wheels.

Deming Nozzles Stand for Highest Pressure

The nozzle is the "business end" of every spraying outfit. Demming Nozzles lead because they do the work right. Nine different kinds—all carefully tested—fit any make of spray pump. Use "Deco" Hose for lasting service.

Spraying Guide FREE

Tells when and how to spray garden,— field—, and orchard crops. Catalog shows all styles and kinds of sprayers for every need and purpose. Gladly sent free on request.

PLANTING ONIONS

I WISH to plant about five acres of onions on land near the foothills. The soil is very heavy and retains moisture to such an extent that it will probably not be dry enough to work before the middle of May. Could a crop of onions be raised successfully planted that late, with plenty of water for irrigation? Where can I get some information on onion culture in California?—Subscriber, Exeter.

The best answer we can give to this question is to reprint an article written by S. J. Murdock for the California Cultivator. Mr. Murdock has had many years of experience in California onion growing and the information he gives is thoroughly reliable.

Culture of the Onion

There is one thing of paramount importance which conduces to the satisfactory results of the successful onion crop, and that is good seed, for on good seed more than any one thing, the careful grower relies, and possibly to a greater extent than that of any other vegetable, unless it be the cauliflower.

Onion seed should be of the best possible strain of the variety intended to be grown and strictly fresh, as it soon loses its vitality. An experienced person ought to be able to judge onion seed as to age and vitality by inspection—bright color indicates new seed, while heavy, plump seed gives evidence of vitality—but for pure strains of unmixed varieties the purchaser will have to rely upon the grower and dealer. High priced seed or new-named novelties it would be best to test sparingly before planting extensively. It is our experience that the novelties of the catalogues are introduced more for the benefit of the originator and dealer than the producer. Nevertheless, once in a great while the producers do get hold of something new that is a source of profit.

Cheap Seed Inferior

Cheapness in seed of any kind carries with it the stamp of inferiority. The value attached to good seed by old growers is often a source of wonder to the inexperienced and is frequently overlooked by the beginner. Poor seed has caused many a novice to quit the business in disgust, with a loss of time, patience and money.

The onion top grows 15 to 24 inches high, according to the variety and the fertility of the soil. As the onion develops and the crop begins to mature the stock or top dries or shrivels up near the bulb and falls over; this forms a ripe onion; but a portion of them, according to the purity of the seed used, will remain large and stiff just above the bulb. This constitutes a scallion or stiff neck. The scallion, although good to eat, does not keep well and is unmarketable; it is an inferior product. Most all vegetables are susceptible of being bred up to a high degree of perfection and the onion is no exception to this rule. If we should grow and select seed from scallions for a few years we would soon have a strain of seed that would grow scallions to a certainty. While on the other hand, if we would select the earliest and best shaped bulbs, with small necks (the word neck is used to designate that portion of the onion top close to and just above the bulb) to propagate our seed from and continue this careful selection from year to year, we would soon produce a strain of seed which would, with proper cultivation, grow a fine crop of well matured bulbs with a small per cent of scallions. The unscrupulous grower will sell all of his marketable product, reset his scallions, and grow a crop of more than worthless seed, whereby the purchaser not only loses the cost of same but invariably his time and labor. Experience with poor seed all goes to show the importance of selling only the very best.

Another disreputable practice among some seedmen is to buy up the seed still on the market at the close of the season, hold it over along with what they may have unsold, till another year. Seed two years old is generally very unsatisfactory to the producer planting it. Yet a crop of very plump, heavy seed may be better at two years than that of a poorly matured crop of new seed.

Good, reliable seed is the keynote to success in onion culture; if we go wrong here all may be lost. Many may think that I am over particular on this point, but my past experience tells me to the contrary.

SEEDING ONIONS WITH PLANET JR.

Preparing the Seed Bed

In the preparation of the seed bed, the work should be done thoroughly, but not too deeply, especially for an early crop. The closer we keep the roots to the surface the earlier the crop may mature. The plot should be brought to the finest state of cultivation, as smooth and level as possible and free from rubbish. The onion will succeed in a greater diversity of soil than is generally believed, but the more humus the better, as fertility is a natural adjunct to a satisfactory crop. I prefer, for a large crop of solid bulbs, a rather heavy soil, well drained, yet, for an early extra crop, would plant on rich, sandy loam. The plot should be protected from heavy winds, and avoid all shade as the onion is a lover of sunshine in all stages of growth. Well subdued and thoroughly drained muck land offers every condition of success.

Planting

Planting is generally done with a seed drill, of which there are several patterns. I find the Planet, Jr., a reliable tool, and prefer the seed drill and wheel hoe as separate machines

to the combined. I can do better work, especially with the wheel hoe, as it is lighter and more open in construction, which gives the operator a better view of his work, and besides you are not wearing out your seed drill, while you are only using the wheel hoe.

Care should be taken to start the first row straight, as following rows are gauged by it. Not only are regular rows the pride of the practical gardener, but a great help in after cultivation—the straighter and the more equidistant the rows the closer the operator can work with the wheel hoe. The closer the work is done the less hand wheeling will be necessary. The rows should be from 12 to 16 inches apart, according to the variety grown, the larger the variety, the greater the distance.

On moist, heavy land the seed should be drilled just deep enough to fairly cover. The lighter and looser the soil the deeper the seed should be planted to prevent drying out before striking root. If the soil is in proper condition to work, the firmer it is rolled the better. The right time to sow the seed varies with different varieties. To cover the entire year I have sown onion seed every month and have been very successful in maturing my crops. However, the crop is not harvested at regular periods as it requires warm, dry weather to mature an onion crop.

Fall Crop

Sow the seed in September or October, quite thick, on a well prepared seed bed, and when the plants are from six to eight inches high, pull up and transplant on well cultivated and thoroughly cleaned plot of ground in rows 12 inches apart and plants three inches apart in the rows. I always cut off the tops so as to leave a stub about three inches long, and think it better to trim the fine roots some also as it makes the transplanting easier and lets the soil pack closer around the plant. For the early varieties plant sets or sow seeds from the 10th of September to October 20.

Late Crops

For late crops sow seed February 15, or as soon as possible after that date. If sown much earlier there will be likely to be a larger percentage of scallions, also more hand weeding. On the other hand, if delayed too long the yield will be perceptibly smaller. Put the rows 12 to 15 inches apart and sow from four to five pounds per acre. After seeding, thorough, shallow cultivation is essential. Do not wait until the plants are up before beginning; from four to eight days will be proper, or when the seed begins to show signs of germinating, which can be ascertained by carefully brushing the soil from the drill row. I put the curved hoes on my wheel hoe, with the straight ends of the hoes pointing inwards and lapping about two inches, and hoe right over the rows, but not deep enough to disturb the seed. Right here, and in the after cultivation, will be seen the necessity of bringing the ground to the finest condition possible.

I find that it saves a great amount of hand weeding by killing the weeds just starting to grow in the rows. When the onions are up sufficiently to follow the rows, I reverse hoes, with the curved ends next to the rows, and just far enough apart so as to hoe as close as possible without cutting the young plants, by running the hoes astride the rows. This operation hoes both sides of the rows at one trip of the machine. Follow this by hand weeding; this operation is best performed by the crawling process—that is, getting down on hands and knees astride of the row and pulling every weed in sight and loosening the soil around and between the plants; repeat this as often as any weeds are to be found, and under no circumstances allow the weeds to grow above the onions; at the same time keep the wheel hoe at work between the rows and as close as possible.

Harvesting

When the tops have turned yellow and dried or shriveled up near the bulbs, and the majority have fallen over, the crop is ripe and ready to harvest. If on moist land they should be harvested at once, for if left long in the ground the moisture from below and heavy fogs will soon cause them to start new roots. On dry land, however, the summer crop can remain quite awhile without injury.

Harvesting a mature crop is done by pulling two or more rows. Lay the onions next to the standing rows, and when across the plot turn round and pull a number of like rows and lay with the ones previously pulled. This leaves them in a continuous pile across the field, when they are in a convenient shape to top, which is generally done with a sharp knife, after having lain a few days to more fully mature. While topping, the bulbs are usually thrown in heaps ready for market or to store away, as the grower may determine. It is best to sack and haul from the field while the sun shines, as the onions should be perfectly dry in either case.

The yield per acre differs with different varieties, under different circumstances and on varied soils. Two hundred centals is a fair yield of the smaller varieties, yet it is not uncomcom to raise 300 to 400 centals per acre, and I know of one instance (which is certified to by witnesses), of one single acre yielding 660 centals, and that, I am proud to say, was done on California soil.

ONE Firm Service Guarantee back of every J-M Automobile Accessory

AS an automobile owner and as a user of automobile accessories you will surely be interested in this announcement.

Now, for the first time, you are able to buy your accessories of one firm, with one service and one guarantee. The benefits of buying in this way are threefold:

First, you have the reputation and financial stability of the H. W. Johns-Manville Company as an assurance that the accessory you buy is a product of proven excellence.

Second, you have their guarantee that should any J-M Accessory prove unsatisfactory, they will make good.

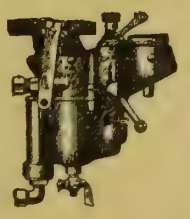
Third, you enjoy the advantage of buying from one of the largest distributors of automobile accessories in the world; therefore you get in extra value what they save in selling cost.

Jones Speedometer

Controlled by Centrifugal Force which is as absolute as the law of gravitation. Not affected by age, use, changes in temperature, altitude, vibration or electrical influences. Absolutely accurate at all times and under all conditions. Large clock-faced dial with widely spaced figures makes it easy to read from any part of the car. **Ford model $12. Other models $12 to $125.**

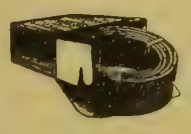
Model "J" Long Horn

A real warning signal with a powerful, compelling warning note that is always heard and invariably obeyed. Strongly built to stand up under the hardest service and to give maximum reliability. Handsome in finish and in design. The horn that insures safety and economy. Made in models for electric as well as hand operation. **Model "J" (illustrated), $5.00. Other Models, $5 to $12.50.**



Carter Carburetor
Multiple-Jet Principle

Obedient to every change in engine speed, insuring the utmost flexibility. Vaporizes every atom of fuel completely, insuring the utmost power and economy. Purchase price will be immediately refunded if after thirty days' use you find you are not getting the results represented. The Carter *must* make good. Sizes for all cars **Special outfit for Ford cars at $17.00 complete.**



J-M Non-Burn Brake Lining

With your brake drums lined with J M Non-Burn you are prepared for the immediate stop that is sometimes the only means of avoiding disaster. You have the satisfaction of knowing that your brakes will work—*instantly.* This thorough dependability is built into every inch of real J M Non-Burn Brake Lining. Costs no more than other linings and lasts longer.

Red Seal Dry Batteries

The most efficient and lasting batteries for all ignition purposes. Sold with the guarantee that should they not prove entirely satisfactory we will replace same with new batteries without cost, or refund purchase price, including transportation charges. Made in three capacities, 20 30 and 35 amperes, 1½ volts per cell. Choice of round or square shape, **25c.**

J-M Non-Blinding Headlight Lens

Makes night driving safe. Enables you to see the road clearly ahead and prevents driver of approaching car from misjudging your position. Effect produced by semi spherical lens with entire surface frosted except for small oval area through which central ray is seen against a surrounding area of non-glaring light. For all standard makes of lamps. **Price, $3.25 per pair.**

Johns-Manville Shock Absorber

Extreme simplicity of construction makes it possible to offer this highly efficient absorber at almost half the cost of other makes. Single cylinder, utilizing specially designed spring, gives greatly increased flexibility and riding comfort with less added weight. Easily attached to any car in one hour. **Per pair $15.**

J-M Auto Clock

A high-grade timepiece, built to withstand the jolts and jars of car service. Eight-day movement, enclosed in dust-proof case. Winding and setting knobs out of the way of meddling fingers: attaching screws concealed. Dial 3½ in. diameter. Finish, black and brass, black and-nickel or all black: choice of dashboard or flush mounting. **Price $5.00.**

J-M Narco Tire and Top Repair Materials

This line includes an efficient and lasting repair for every tire trouble, as well as an excellent preservative for automobile tops —J-M Tirenew, J-M Narco Tire Cut Filler, J-M Narco Rubber Reviver and Refinisher, J-M Narco Vulcanizing Cements, J-M Narco Cementless Patches, each the best product for its purpose. With one of the J-M Narco Tire Repair Outfits you are enabled to make home and roadside repairs that will stand, and at a very slight cost.

J-M (Mezger) Soot-Proof Spark Plug

Gives the biggest, fattest, hottest spark your current can deliver and will not short-circuit. Gas-tight construction positively prevents compression leakage. Specially tempered porcelain stands extreme temperature changes without cracking. We guarantee the performance of every genuine J-M (Mezger) Soot-Proof Spark Plug. Sizes for all cars and motorcycles. **Price 75 cents.**

OTHER J-M AUTOMOBILE ACCESSORIES

J-M Automobile Tape J-M Fire Extinguisher "Noark" Enclosed Fuses G-P Muffler Cut-Out J-M Packing

Sold direct on receipt of price if not at your hardware or accessory dealer's. Write for booklets. 3003

H. W. JOHNS-MANVILLE CO.

Farm Bureaus and Institutes

CALIFORNIA now has 11 county farm advisers. Glenn and Solano are the newest counties to receive appointments. In regard to them B. H. Crocheron, state leader for California, writes:

B. H. Crocheron, State Leader

The newly appointed farm advisers for Glenn and Solano Counties took up their work March 1.

On that date I met with the board of directors of the farm bureau of Solano County and with Mr. Mills, the newly appointed farm adviser of that county, to outline the beginnings of the work of the organization. On Wednesday, March 3, I met with the directors of the farm bureau of Glenn County at Willows and the newly appointed farm adviser, Mr. W. H. Heileman, for a similar purpose.

The conference of farm advisers held at Berkeley the third week in February had no public interest, but was really an experience meeting, or exchange of opinions between the farm advisers employed through the state, in order that each might get the best ideas of the others in regard to methods of work. In order to keep the farm adviser thoroughly conversant with the latest agricultural science, the heads of the various divisions of the college of agriculture gave the farm advisers hourly addresses on new developments in their branch of agriculture, much of which included scientific results that have not yet been published. By this method we hope to keep the farm advisers in the forefront of modern knowledge. The conference disclosed an array of activities which the advisers are undertaking and sent them all home feeling even more optimistic than ever regarding the future of the work. We are convinced furthermore that these conferences are of exceeding value and that they will be held from time to time in the future.

Alameda County, W. H. Nixon, Adviser, Hayward

Hayward, Monday, March 1.
Castro Valley, Friday, March 5.
Murray Township, Monday, March 8.
Pleasanton, Wednesday, March 10.
Oakland Day, Friday, March 12.
Irvington, Tuesday, March 16.
Centerville, Friday, March 19.
Newark, Monday, March 22.
Niles, Wednesday, March 24.

Napa County, H. J. Baade, Adviser, Napa

Coombsville, March 2.
Browns Valley, March 3.
Salvador, March 6.
Carneros, March 8.

Rutherford, March 15.
St. Helena, March 17.
Calistoga, March 19.
Wooden Valley, March 22.
Berryessa, March 24.
Pope Valley, March 26.

During the month of March poultry management and spraying will be discussed at the center meetings. These meetings are for all people interested in agriculture. Every one is welcome.

Napa County has just had an extended visit from Dr. Cady, of the United States department of agriculture. Dr. Cady has been giving hog cholera vaccination demonstrations in this county, in 12 different places. Following each demonstration he has given an illustrated lecture in the evening.

We feel that a campaign to prevent hog cholera is far more essential than one to cure it, or control it, after it has once gotten a foothold. We are, therefore, very much elated over the services that we have received and hope that other counties will be as fortunate as we have been in getting Dr. Cady's services.

Yolo County, Niles P. Searls, Adviser, Woodland

Guinda, March 2.
Esparto, March 3.
Rumsey, March 4.
Winters, March 8.
West Sacramento, March 12.
Clarksburg, March 20.
Esparto, March 22, special hog cholera meeting with demonstration.
Knights Landing, March 23, special hog cholera meeting with demonstration.
Yolo, March 24, special hog cholera meeting with demonstration.
Woodland, March 25, special hog cholera meeting with demonstration.
Davis, March 26, special hog cholera meeting with demonstration.

The hog cholera meetings will begin a county campaign against this trouble, Dr. Cady, of the United States department of agriculture, having been secured as a lecturer. Dr. Cady will do demonstration vaccination in the afternoon and at night will show a series of lantern slides dealing with the topic. A Swine Raiser's Association may be formed to deal with the control of the disease.

The two cow testing associations that have been organized by the farm bureau are doing excellent work, something like 1700 animals being under test. By intelligent culling out one dairyman has doubled his average production, while another has increased from an average of 20 pounds to one of 30 pounds per month.

San Joaquin County, Frank F. Lyons, Adviser, Stockton

Thornton, Monday, March 1, G. L. Barber, director.
Lodi, Thursday, March 4, H. T. Bailey, director.
Acampo, Friday, March 5, George Ashley, director.
Stockton, Saturday, March 6, W. N. Harrison, director.
Lockeford, Monday, March 8. N. H. Locke, director.
Linden, Wednesday, March 10, E. L. Davis, director.
Escalon, Monday, March 15, E A. Clough, director.
Ripon, Thursday, March 18, J. P. Watkins, director.
Manteca, Friday, March 19, J. W. Graves, director.
Tracy, Monday, March 22, H. A. Frerichs, director.
Holt, Wednesday, March 24, Ralph Cople, director.
Waterloo, Friday, March 26, W. H. Daniels, director.

We intend to form one large San Joaquin County cow testing association with two testers. The organization is in the hands of a committee of five dairymen, appointed by the president, Mr. Ed Powers, of the San Joaquin County farm bureau. We have about 1000 cows signed up now and within another week expect to have enough to require the services of two testers. During the second week of March we expect to hold a dairymen's meeting in Stockton and complete our organization. At this meeting the officers for the year of 1915 will be elected and a representative from the animal husbandry department of the University will speak.

Ventura County, William B. Parker, Adviser, Ventura

Fillmore, to be arranged.
Nordhoff, March 8.
Oxnard, March 10.
Ventura Avenue, March 11 (joint meeting with Avenue Ladies' Club).

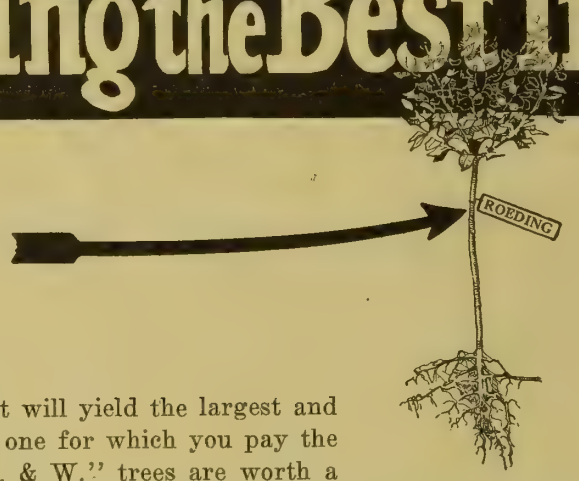
To Readers of the Cultivator: Hundreds, possibly thousands, of subscribers of this journal have in the past bought Roeding & Wood trees and can testify to their splendid quality and general worth.

Save Money on Your Orchard By Planting the Best Trees

If you only knew how good a tree must be in order to get that name on it, you'd sit right down now and send us your order.



THE cheapest tree is the one that will yield the largest and most profitable crops—not the one for which you pay the least money at the outset. "R. & W." trees are worth a great deal more than we ask for them and are the cheapest trees for you to plant. Our stock is the result of over 30 years' experience and being grown in the choicest spots of California, under ideal soil and climatic conditions, will give thorough satisfaction not only as to first cost, but as to ultimate profits.

Oranges

We call special attention to our splendid stock of Washington Navel oranges—budded from trees of select strain, the kind that yield premium fruit. We can supply all the commercial varieties of oranges, as well as many specialties.

Lemons, Pomelos, Avocados, Etc.

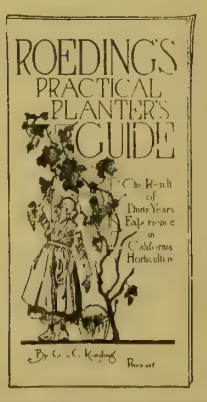
Our stock of citrus trees includes all the leading varieties, such as Eureka Lemons, Marsh's Seedless Pomelos, as well as many others. No matter what you may wish to plant in the line of citrus fruits, you can best supply your needs at the Roeding & Wood Nursery.

Olives

We can supply you with any quantity of Manzanillo, Mission and other varieties of fine olives at very reasonable prices. Write for a free copy of our "OLIVE BULLETIN." It gives valuable information that should be in the hands of every prospective planter.

Send for this

FREE **A Copy of the most Remarkable Book Ever Offered to the Planter**



This book gives expert advice on planting, pruning and care of stock. It is fully illustrated with photos of orange, lemon, olive and other trees, showing "before" and "after" pruning. It sells for 25c, but is worth 100 times that to any grower. SEND US A LIST OF WHAT YOU INTEND TO PLANT THIS SEASON AND WE'LL SEND YOU A COPY FREE. Write us today. Ask for our prices and suggestions.

I have my hog contests well under way and expect same to be very satisfactory in every respect. A large number of the farmers are getting into it. It is hoped that it will bring out some important facts especially on the economic question. (The rules governing contests will be given in a later issue of the Cultivator.)

FARMERS MEETINGS IN ARIZONA

The agricultural extension service of the University of Arizona college of agriculture under direction of Prof. S. F. Morse has arranged for a series of special farmers' meetings all over the state. The speakers in each instance will endeavor to spend as much time as possible before the meetings, which will be held either in the afternoon or the evening, in some cases occupying two sessions, visiting various farms in each locality and acquainting themselves with the farmers' problems so that their talks may deal entirely with local conditions. If the speaker is to talk on livestock, it is desired that the meeting be held, if possible, on somebody's ranch where livestock may serve as the object lesson of the talk.

It is suggested that any farmers desiring special assistance from the experts of the agricultural extension service hand their names to the local leader in charge of the farmers' meetings.

Following is a list of the meetings and local leaders:

Casa Grande, March 2, J. F. Brown, local leader.
Summerland (near Maricopa), March 3, F. H. Swensen, local leader.
Crane (Yuma), March 4, C. J. Wood, local leader.
Somerton, March 5, M. A. Gilmer, local leader.
Wellton, March 6, J. D. Andrews, Jr., local leader.
Phoenix (Roosevelt District), March 3, K. S. Townsend, local leader.
Lehi, March 4, Elijah Allen, local leader.
Gilbert, March 5, I. R. Burke, local leader.
Wickenburg, March 8, F. B. Jacobs, local leader.
Cornville, March 10, C. B. Coulson, local leader.
Oak Creek, March 11, J. O. Hurst.
Camp Verde, March 12, C. C. Calloway, local leader.
St. Joseph, March 15, Bishop John Bushman, local leader.
Woodruff, March 16, Bishop L. M. Savage.
Snowflake, March 17, President Samuel F. Smith, local leader.
Show Low, March 18, Chas. T. Savage, local leader.
Lakeside, March 19, Bishop A. P. Larson, local leader.
St. Johns, March 22, Levi Udall, local leader.
Flagstaff, March 24, W. E. Berg, local leader.

The speakers at these meetings will be as follows:

G. W. Barnes, farm adviser on live stock of the agricultural extension service, University of Arizona college of agriculture, will talk on various

New MACATAWA Everbearing Blackberry

The MACATAWA originated by Alfred Mitting, in 1909, at Holland, Michigan, a cross between the true Giant Himalaya and the Eldorado, and offered to the trade in the fall of 1912. It went through the extreme cold winter of 1911-12 in an exposed condition without freezing. The Macatawa has characteristics of both its parents. The fruit is very large and sweet, in fact, it is the sweetest blackberry grown. It is coreless and almost seedless, very solid, jet black when ripe, and can be shipped 1000 miles without bruising. The shape is oblong, very uniform, averaging three and one-half inches around one way, by three and one-fourth inches the other way.

The Macatawa is 3½ inches one way by 3¼ inches the other

It begins blooming in the southern and coast States about February 15. One month later you can begin to pick. It is a continual cropper from Spring until the frosts, in fact, is the only berry in my 46 years' experience that is an everbearing variety.

Its habit is similar to that of the Eldorado, upright grower, needs no support, self-branching, and the bloom is almost semi-double, about the size of a silver dollar. The young plants come from suckers and not from tips, but it is a shy sucker maker, so we propagate by digging up the roots between the rows and cutting same into one, and one and one-half-inch pieces.

These piece roots are sown in rows four inches deep, the rows two feet apart. They should be sown in the southern and coast States from December 1st to March 1st, in the center states from March 1st to May 1st. By the next fall you will have nice plants full of fiber roots, and the plants will be 18 inches high and ready to plant in the field for fruit. Our price for these piece roots, $10 per thousand; one year old plants, $1.50 per dozen, $10 per hundred, $100 per 1000. 50 plants go at 100 rates, 500 at thousand rates.

Small Fruits Vegetables

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator By O. M. Morris

THE longer days of later spring afford splendid opportunity for garden work and operations may proceed with greater rapidity. The list of vegetables which may be planted covers practically all varieties though it is possibly a little early still for melons, cucumbers and squash.

The most important feature of this month's garden work is thorough preparation of the soil. Ground for vegetables should be worked deeply and thoroughly and made as mellow as possible by continual harrowing or raking. It is not difficult to get a good stand of seed from light, loamy soil but on heavy clay or adobe the soil must not be allowed to pack too deeply over the seed. Most of the failures with the smaller seeds such as lettuce, carrot and parsley are caused by planting too deep and failing to keep the surface soil broken up to avoid crusting on the surface. If rains should follow shortly after planting it is advisable to use a rake to break up the surface as soon as the soil is sufficiently dry to work up mellow, but under no circumstances should it be worked when sodden or over wet.

Early planted tomatoes, egg plant and peppers should be covered with paper, or some protection given during cold nights or from beating rains, but they should have the full sun during the day. Other vegetables will not need any protection.

Early summer squash is being planted now but the hills should be covered during the night. This is one of the most hardy of the squashes and will start much earlier than any of the others.

JAPANESE KUDZU VINE

I was much interested in a contribution from Mr. Joseph Meehan in the January 14th issue of the Cultivator regarding Japanese kudzu vine, I am well acquainted with this vine, having been born in the sunrise country, and would like to say something more about it.

The real name of this plant is "kuzu" and not kudzu. Kuzu vine is a perennial plant of a decumbent growth. In one season it will make a growth of from ten to 60 feet, and it is not uncommon to find a vine 100 feet long. The average size of the stem is from one-fourth to one-half an inch in diameter. Its form is cylindrical. The arrangement of the leaf is alternate; it is large, unipalmate and the venation is radiate. The margin of the leaf is palmately cleft, the surface is pubescent, while the texture is coriaceous, with a long petiole. The young kuzu vine rarely flowers. When old it produces flowers of a purplish hue, resembling those of the wistaria. It is monoecious. The fruit is somewhat similar to the lima bean.

Throughout the southern part of Japan, especially on the island of Kiushu, we find the kuzu vine growing abundantly on hillsides and along river banks. The natives gather the vines in the summer when they are tender and feed stem, leaves and all to horses, cattle, hogs and sheep. In the fall the farmers strip off the leaves and cure them for winter feed for domestic animals. Stripped of its leaves the vine is used for tying fences, making rope, etc. The root of the kuzu is fascicular of a white or creamy shade. It weighs from two to 20 pounds, according to the age of the vine. The root is the most valuable part of this plant, being high in carbohydrates, especially starch, and from it is manufactured "kuzu," an article of food closely resembling corn starch which is used for the making of cakes, etc.

The propagation of the vine if from young rooted plants.—G. S. Ura, Salem, Oregon.

SUGGESTIONS ON VACANT LOT UTILITY

Written for the California Cultivator By D. F. Reichard

(We have request from a public-spirited citizen who wishes to improve the outskirts of towns, and especially to secure some useful production from overgrown town lots. He has asked as to crops which might be secured from dry farming operations. The matter was referred to Mr. D. F. Reichard and he gives the following valuable suggestions:)

The copious and well distributed rains of this winter make it possible to harvest a profitable crop from the usually untidy, weed-growing, litter catching, pest-breeding vacant lot.

This week is an ideal time to start operations. The weeds and grass have made enough growth so that they will make fine fertilizer when plowed under. The first thing to do is to have the lot plowed—plowed well, at least ten inches deep. If you are hiring the work done have it expressly understood that you want the lot plowed that deep and then if possible be on the ground to see that it is done. Stress is put on this deep plowing because it is hard to impress on people that to have good crops there must first be a good seed bed, and the foundation of the seed bed is to have the soil worked deeply. As soon as the plowing is done have the ground thoroughly harrowed, going over the piece at least twice. This is to make a fine mulch on top and settle the ground so as to reduce to a minimum the evaporation of moisture from the soil.

The plowing and harrowing of a lot 50 feet by 150 can be well done in three or four hours at a cost of from $2.00 to $4.00, according to the nature of the soil and location of lot.

If possible it is a good plan to let the ground lie for at least two weeks before working on it, to give the grass and weeds time to decay. If it rains in the meantime, so much the better, the ground is in shape to take on more moisture and the weeds will rot faster. At the end of two or three weeks either plow and harrow the piece again or thoroughly work it up with a cultivator. This will reduce your weed problem to a minimum and put your soil in fine condition to receive the seed. After each rain storm the ground should be cultivated so as to keep a good mulch of fine dirt on the surface to retain moisture.

Now comes the question of what to plant. In the beginning remember only one crop can be grown without irrigation unless the land is naturally damp soil. If you just want something to look nice and green during the spring, but brown during the summer, sow grain, barley, wheat or oats. This, however, is only practical where there are several lots together. This could be beautified by scattering a few seeds of wild sunflowers with the grain. These would make their growth after the hay was cut and bloom through the late summer and fall.

The most practical crop would be potatoes. These planted any time in March will mature and should be dug before the middle of July. The tops dry down to almost nothing, thus leaving the ground fairly clean for the rest of the season. If there is moisture still in the ground after the potatoes are dug, pumpkins or Hubbard squash might be planted, spacing them at least 12 feet apart.

Corn is a good crop but really should have some late rains to make it profitable. Neither sweet or field corn is safe to plant before the first of April.

Peas require considerable moisture and if put in as soon as the ground can be put in shape should give a good crop.

For either muskmelons or watermelons the ground should be thoroughly cultivated after each rain until the vines begin to send out runners. It is not safe to plant these until the middle of April.

Continued on Page 287

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

THE same care should be used in the preparation of the soil for flowers as for vegetables.

Roses and other hardy bush plants which are handled while dormant should be put in at once. The growth will soon start and it is then much more difficult to secure best results. However, roses are now grown largely in pots and these may be transplanted at any season of the year.

Sweet peas should also be planted at once, as well as asters. Hollyhocks will come into bloom from March planting during July and August.

If one has a shady location, either under a tree or on the north side of the house, there is nothing finer than the tuberous begonias. These bloom continually throughout the summer. Another pretty plant requiring shade is the primula, either abconica or malacoides. These are quite hardy and bloom for a long period, practically all summer if planted early. They should be planted in a protected bed or box and transplanted as soon as large enough.

Some of the new snapdragons in delicate shades have become very popular for cut flowers. These are easily grown and will bloom throughout the summer. Centaurias, scabiosa and zinnias give a great quantity of good cut flowers and are very satisfactory.

A new aster that is very attractive is the Crimson Ray. This resembles a large single chrysanthemum in appearance and makes a beautiful flower for cutting. The color is splendid. It is upright in growth and very hardy.

The Margaret carnation or hybrid carnation has become very popular for midsummer blooming. This comes in nearly all shades that the true carnation comes in and blooms from seed in about four months, blooming profusely during midsummer when other carnations are practically resting.

For yellow flowers there is probably nothing finer in the hardy class than coreopsis drummondi. It is a large branching yellow flower with a deep maroon eye, very attractive and lasting as a cut flower. Other good yellow flowers are gaillardia and calendula, both quite hardy. Planted now they will bloom in from three to four months and will continue throughout the summer.

Do not forget to include salpiglossis in the list of flowers for summer bloomers. Practically every color of the rainbow is represented in its veined and mottled petals. The schyzanthus or butterfly flower should not be omitted. These are two of our practically new flowers which are unsurpassed for their beauty.

MANY SHIPMENTS OF ORNAMENTAL PLANTS FROM BELGIUM

Shipments from Belgium of ornamental plants containing from two or three plants to 1000 plants in each shipments have been coming into the United States at the rate of about 50 a day, according to the federal horticultural board. While France sends us more nursery stock during the year than all the other European countries combined, during October and November more ornamental plants came from Belgium than from all the others combined.

The Belgian shipments come via Holland, the territory where they originate being on the Dutch border. The shipments come largely to brokers in New York City who distribute them to individuals.

France, which sends us much of our imported stock as well as ornamental trees, also continues to ship, the territory where these stocks originate being west of the war zone. The federal horticultural board has cabled the French government regarding the maintenance of the inspection service and has received through the French ambassador information that the service is being maintained. Large importers of French stock have since confirmed this advice.

Under the existing European conditions there may naturally be expected some irregularity in compliance with our own regulations, and certain leniency may occasionally be necessary, especially where safety can be fully insured by adequate inspection on this side. Among the plants that need especial attention in this line are azaleas which come in great numbers from Belgium. Gipsy-moth egg-masses are occasionally found in these plants, but in all cases the plants are rigidly inspected and affected plants are destroyed. Azaleas and similar plants are often set out in gardens after their house use is over or they are thrown out in yards or vacant lots. If such azaleas harbor eggs of the gipsy moth, the hatching larvae may easily gain access to surrounding vegetation.

ANOTHER APPARENT CHANGE

In "Plant Life," by J. Bretland Farmer, M. A. D. Sc., F. R. S., Professor of Botany in the Imperial College of Science and Technology, London, on page 174, occurs an interesting account of changes in plant sex, due to a smut that sometimes infests the Red Campion, a close relative of the carnation. This parasite apparently changed female flowers to males in two different and distinct ways.

There remains, however, some doubt as to actual accomplishment of such change. The result is very startling, to say the least, and we quote herewith the precise statements of Prof. Farmer:

"The fungus only reaches maturity and produces its spores in the stamens. So far as the male plants are concerned there is no difficulty, but with the female flowers it is otherwise. What the fhngus does when it attacks the latter is to stimulate the plant to produce stamens exactly like those of a male flower. * * * Nor

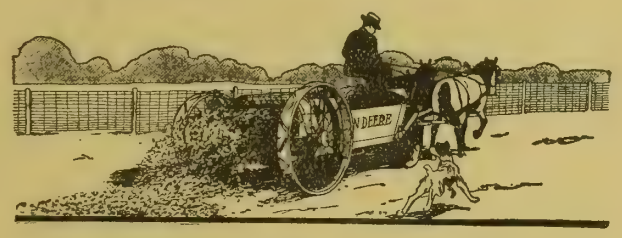
John Deere Implements

John Deere Syracuse Hillside or Swivel Plows

Nos. 821, 822, 823, 824 and 825

The plows with ample throat room and close fitting joints to prevent clogging. Do equally good work on hillsides or level land. Moldboards of new design, turning furrows smoothly up or down on hillside land. Long moldboard—a clean furrow slice. Option of white iron or tempered steel moldboards.

Write us for information on the Syracuse Hillside or Swivel Plows Nos. 821, 822, 823, 824 and 825. We will send it to you free.



John Deere Spreader

The Spreader with the Beater on the Axle

The beater—the business part of a spreader—and all its driving parts, is mounted on the rear axle. This is a patented feature. You cannot get it on any other spreader. Here is what the beater on the axle means to you:

It means: No clutches to give trouble—all taken off.

It means: No chains to break or get out of line—all thrown away.

It means: Less than half the parts heretofore used on the simplest spreader—some two hundred parts are done away with.

It means: Manure is not thrown on the axle—straw and trash cannot wind around it.

It means: You get big drive wheels and a low down spreader, without stub axles—that means traction and strength.

It means: Drive wheels back out of way when loading—you see where you place each forkful.

The John Deere Only Hip High

The top of the box is only as high as your hips. The John Deere Spreader is easy to load. You see where you place each forkful.

To start spreading, you pull back the lever at the driver's right—that's all. A boy can operate it.

Call on nearest John Deere dealer and see the spreader with the beater on the axle. Write for "Farm Manures and Fertilizers", a valuable text book free.

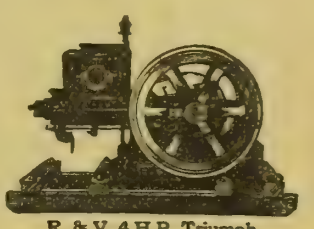
R. & V. Gasolene Engines

New Triumph One Horse Engine. Just the engine for light work about house and barn, such as running washing machine, pumping water and operating other small machines. Saves every member of the family work and worry.

A reliable, efficient, low priced but high grade engine. Easy to start, smooth running, requires no attention when in operation, economical in use of fuel and perfectly safe in and around buildings. All working parts are back of the fly wheel out of the way—a neat outfit in every respect.

R. & V. Triumph Engines for All Farm Machinery

The R. & V. Triumph line of engines is also made in 2, 4, 6, 8, 10, 12 and 16 H.P. sizes, stationary and portable. Every farm can use one or more of these engines to advantage.

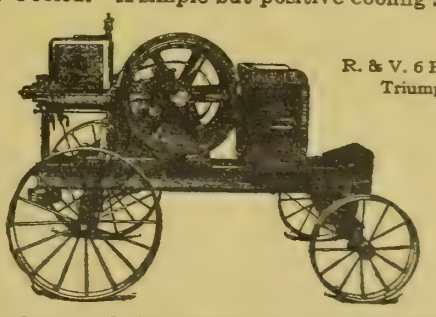


R. & V. 4 H.P. Triumph

They are dependable gasolene engines—always develop rated horse power.

An extra ring over the piston pin prevents scoring and ruining cylinder. This is an unusual precaution for lengthening the life of a gasolene engine. This careful attention to details is followed in constructing every part of the R. & V. Triumph.

Hopper Cooled. A simple but positive cooling system.



R. & V. 6 H. P. Triumph

The gasolene tank for every R. & V. Triumph Engine is most conveniently and safely located—on practically all of the stationary engines it is in the sub-base.

Write for free booklet "Letting Gasolene Do It." This book tells how you can save time every day in the week by using an R. & V. Triumph Engine.

Better Farm Implements and How to Use Them

FREE BOOK Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, discs harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X-111.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

SILOING WHEAT

A subscriber at Pixley informs a representative of the Cultivator that this year, with the heavy rains and early planting of his crop of wheat, he fears it will be so heavy it will lodge, and to reduce the chances in this particular and to secure some additional profit, he will cut the wheat before stooling and place in silos. This lush growing wheat will certainly make finest ensilage and materially increase profits, and will be certainly insured against lodging. Perhaps this gives suggestion for some other of our wheat growers. Along this same line we call attention to Dr. Leroy Anderson's article in this issue, in which he refers to siloing foxtail and other native growth.

ORANGE DAY

Complaint has been made that we are having a good many special days for fruit and farm products. We have had apple days, rice days, raisin days, and now come olive and orange day. We do not agree with the objectors, for the reason that these days call attention to the healthfulness of these foods, and to how their use may well be increased in every home. We will always be a nation of meat eaters; for, try as much as they please, the vegetarians will never convince the majority of us that meats should be tabooed entirely. But their campaign has a beneficial effect in inducing us to give more consideration to fruits and vegetables. As to ways of cooking or serving the delicious orange, there is but little improvement over the good old way of going at it with the two hands, yet from salads to marmalades and pies there are most attractive ways of serving it. Some of these will be given in the Cultivator of the issue preceding March 20, which has been fixed as Orange Day.

OLIVE DAY

March 31 has been declared California Ripe Olive Day. Mr. George C. Mansfield of Oroville, who is chairman of the publicity committee, writes:

"I need not call to your attention the growing importance of the California ripe olive industry, nor need I tell you that not one person in one hundred in the United States is acquainted with the delicious flavor, the food values, and the healthful qualities of the California ripe olive. A great national campaign has been inaugurated to spread abroad the gospel of the California ripe olive.

"We desire to enlist your assistance in this movement. In particular, we ask that you feature California Ripe Olive Day in the editorial and news columns of your interesting magazine. Your wide circulation through the various interior communities will do much toward making this movement a big success.

"We believe that by all standing together and by working shoulder to shoulder, the olive industry of California can be advanced a generation in a single day."

Surely, there is no more healthful food than California ripe olives, and the observing of this day should not only add to the profit which should come to the grower, but will increase the use of this excellent food the country over.

BUY IT NOW!

Prosperity seems to be taking its own pace in returning, but the prevailing opinion is that it is heading in the right direction—it is coming our way. Certain it is that European nations have been pouring in orders for many productions with which to build up—perhaps more with which to destroy—the latter of which we all regret. As a special aid to prosperity's return there has been promoted a campaign of "Buy It Now," this on the presumption that the producers especially of the country will soon be ready to buy more extensively than they have been doing for the past few months. If orders for goods which are known to be needed may be placed at once, it certainly will help to give confidence to dealer and manufacturer. Prosperity is largely in the hands of the producing classes. It has been said that large moneyed interests often cause panics for their own advantage. We do not believe that has been charged in the present general depression. The change in national policies, combined with the greatest war the world has seen, has been sufficient to completely upset all financial calculations, and perhaps the greatest suffering falls on the laborers connected with the industries. Farmers, of course, have felt the depression, but they have not been ground down by abject poverty, as have many in the manufacturing centers. We have occasion to be thankful; let us pass on the prosperity, or at least encourage its return as soon as possible.

POULTRY FOR PROFIT

The reception given to the first of the Cultivator's dollar series, "Poultry for Profit," is gratifying; it has been complimented not only for its practical instruction in egg and poultry production, but for its clear type and substantial binding. For the small edition, which such a special subject demands, it is surprising that such a book could be put out for the sum of one dollar. As we have stated before, there are 250 pages within the two covers, and the clear illustrations give great value to the text. Within the twelve chapters almost every feature of the poultry industry, from the making of a beginning to diseases and some of the discouraging features, are fully discussed. Mrs. Koethen has written from her own experience, and knows from her own successes and failures wherein instruction is needed, especially by the beginner in poultry. She disclaims any effort at educating old and experienced poultrymen. Notwithstanding that, we have found some poultrymen of years of experience who consider this a most admirable presentation and a book helpful to everyone engaged in poultry work. Notwithstanding the extremely low price which has been placed upon this book, it may be secured at a still lower one in combination with the California Cultivator—with the Cultivator one year for the sum of $1.75.

COOPERATION IN MINNESOTA

The University of Minnesota has issued a bulletin giving statistics of cooperation among farmers of Minnesota during 1913. It makes the statement that Minnesota leads all other states in the Union in volume of business conducted by cooperative organizations. We had rather supposed that California had this distinction, but possibly we are mistaken for we note that in Minnesota there are 2013 cooperative organizations which had a combined business in 1913 of $60,760,000.

California has one cooperative organization which does annually more than one-third of all the business of the entire state of Minnesota. It also has a very great number of other successful canneries, creameries and fruit growers' associations, but so far as we know there are no available statistics, and until we have them we may be compelled to grant Minnesota's claim.

Of her 2013 associations, 614 are cooperative creameries. These do a combined business of $21,000,000. There are 270 elevators, doing a combined business of $24,000,000. Of stock shipping associations there are 115, stores 120, fire insurance companies 154, telephone companies 600, these latter doing practically $1,000,000 worth of business. There are 34 cooperative cheese factories, 20 potato warehouses, and 86 other associations classed as miscellaneous. Amongst these are cow testing and fruit shipping associations, lumber yards, laundries, corn marketing concerns, and many others. The cooperative associations made a total of almost 75,000,000 pounds of butter in 1913, or an average of 122,000 pounds per creamery. The expense of making butter was 2.2 cents per pound; the total number of patrons, 65,000.

The insurance companies are joined under the plan known as township units. These companies have been doing cooperative insurance since 1867. The total amount of insurance in force is $322,000,000, to which it has increased from less than $1,000,000 in 1878. The cost of insurance in these companies has been very low, in 1913 being 18 cents per $100, while the stock companies doing business in the same state have charged 46 cents. On this basis the cooperative insurance companies saved the farmer a million dollars during the year 1913. In fact the actual saving is much greater than this for the reason that these mutual companies have year by year forced down the old companies' rates so that all insurance in the state has benefited. The publication estimates that the total saving to the farmers of the state because of these mutual companies during a period of 35 years is in excess of $20,000,000.

Agricultural Notes

The government built more than 2000 miles of trail and 3000 miles of telephone line on the national forests in 1914.

The United States department of agriculture announces that a peach which bears an edible fruit containing a smooth stone has been brought from China and may be used to improve our commercial peach.

Fire on the national forests of the West in 1914 caused a loss to the government of not quite 340,000,000 board feet of merchantable timber, valued at $307,303, and of reproduction, or young growth of trees, valued at $192,408, according to statistics just compiled by the forest service. There were 6,605 fires, of which 1,545 burned over an area of ten acres or more.

According to the report of the joint congressional committee on federal aid to good roads, the annual expenditures for road improvement in the United States amount to about $204,000,000. Automobile license fees amount to about $8,000,000 annually. County, township and district road bonds were voted in 1913 to the amount of $50,635,000.

The use of fish as cattle food has a novel sound, but it appears to be a common practice in various parts of the world. In Shetland and Iceland dry salt fish is fed to cattle, sheep and even to horses. So long ago as 1853, Sir John Lawes carried out experiments at Rothamsted, England, on the feeding of pigs with dry Newfoundland cod fish. He found that the fish-fed pigs were fat and well grown, and there was a very good proportionate increase to food consumed.

For the first time in many years information collected by the department of agriculture shows that all classes of live stock in the United States are increasing in numbers. Thus the real facts contradict, absolutely, sensational reports that prices for meat and shoes would rise to unprecedented figures in the immediate future. On January 1, for example, the number of beef cattle showed an increase of 3.4 per cent over the number a year ago, and an actual increase of 1,212,000 head. Hitherto the number of beef cattle in the United States has declined steadily since 1910. There are also more milch cows in the country than last year, the increase being 2.5 per cent, or in numbers 525,000. Swine showed the greatest increase of all classes—9.6 per cent.

D. O. Lively, chief of the live stock department of the Panama-Pacific sends out word that as the cattle competitions at the exposition do not begin until October 18, sheep and swine November 3, it is hoped that long before these dates the foot and mouth disease will be effectually stamped out. Dr. Chas. Keane, California state veterinarian, has made the following rule: "No cattle, sheep, or other ruminants, or swine, will be permitted to be shipped for exhibition purposes at the Panama-Pacific International Exposition from any area in which foot and mouth disease has been found, or from areas contiguous thereto until a reasonable length of time has elapsed since such territory has been declared clean by the United States department of agriculture and state live stock sanitary officials." Any negative action by individuals, associations, clubs or states at this time would be premature. There will be a truly great live stock show at San Francisco and the wise breeder will get ready for it.

Agricultural News Notes of the Pacific Coast

Northern California

The Humboldt County Dairymen's Association recently met at Ferndale.

A 20,000-acre irrigation project is nearing completion in Siskiyou County.

Many orange and lemon trees will be planted this spring near Marysville.

Forty thousand deciduous trees have been planted in Nevada County this season.

A purchaser of beans secured over $200,000 worth in one district of Sutter County.

A syndicate of San Francisco capitalists is financing a large dairy at Alturas, Modoc County.

Chico's development committee is planning to have a tree planting week in the very near future.

One tract of land comprising about 2000 acres will be planted to rice near Yuba City, Sutter County.

The Farmers' Union of Gridley reports a membership of 75 and a most successful year of business.

The Napa County farm bureau recently held an interesting meeting of the board of directors at Napa.

At the March meeting of the Rio Linda Improvement Club Judge Peter J. Shields will talk on rural education.

Plans are making for the spring picnic at the university farm at Davis. Some date late in April will probably be chosen.

It is reported that a deal is practically completed which will bring 1000 colonies of bees to Los Molinos, Tehama County.

Dr. Cady of the United States department of agriculture met with several farm centers in the Sacramento Valley recently.

The fish hatchery near the junction of Battle Creek and the Sacramento River is feeding at present over 5,000,000 young salmon.

A new town to be known as Mission is to be established in Yuba County. It is in the center of a large olive producing district.

Professor Bioletti gave some interesting addresses, demonstrating with practical field work on pruning of vineyards, near Cloverdale, Sonoma County.

Many ranchers and sheepmen of Yolo County have been in attendance daily at the series of lectures and demonstrations given at the university farm at Davis by W. T. Ritch, Australian wool expert.

At the last meeting of the El Dorado Stockmen's Association at Placerville, a committee was appointed to revise by-laws. The committee now has finished its work and will report to the association at its next meeting, to be held in Jackson April 3.

In his annual report to the governor State Forester Homans states that the fire season of 1913 was exceptionally severe, the money loss being over $500,000. During the past two years three forest protective associations have been organized, making six in the state, which are now doing effective work.

Central California

Raisin growers of Stanislaus County are organizing.

Several farmers' unions are to be established in Tulare County.

High school boys of Ceres, Stanislaus County, are planning a hog raising contest.

The heavy rains have prevented much of the tree planting which was contemplated.

The Associated Raisin Company is engaged in making a shipment of 200 tons of raisins.

The Tulare Cooperative Poultry Association handled over 5000 dozen eggs in January.

Reedley raisin growers are adding new members to the Associated Raisin Company.

The California Green Fruit Association held its annual meeting at Fresno last week.

Tulare County olive packers have received high commendation for canned olives marketed.

The Associated Raisin Company has taken over the Kings County Packing Company's plant at Armona.

Citrus growers of Lindsay, Tulare County, are justly proud of their winnings at the National Orange Show.

The state dairy inspector recently caused arrests of dairymen at Kerman because of unsanitary conditions.

Manager Ellis of the Cured Fruit Association announces that practically all dried peaches have been sold.

The Lincoln Grange held a most interesting session at Cupertino, Santa Clara County, on Washington's birthday.

Tulare County now claims 42,000 acres of citrus fruits in her county, about 27 per cent of which is in full bearing.

It is announced that a 20 per cent dividend was paid for the year by the San Joaquin County Table Grape Growers' Association.

San Joaquin County assemblymen are working to secure the passage of a bill which will standardize all fruits shipped from California.

The Associated Raisin Company has purchased the Fresno Home Packing Company. This is the firm which has been putting out the Blue Ribbon brand of raisins.

The Madera County farm bureau has arranged for two contests, prizes to be awarded at the county fair in the fall. One is for hay and legume growing, the other for hog raising.

Water was turned into all the irrigation canals of Kerman, Fresno County, the second week in February. Deep snows in the mountains assure ample water supply for the summer.

A peach cannery is assured for Kingsburg. A committee of five has been appointed to secure a site. The committee consists of Henry Brandvig, A. J. Anderson, J. T. Norby, A. L. Cross and J. L. Norman.

Farmers of California have been made preferred customers for the purchase of grain bags till April 1. Up to that date they will be able to get all the bags they will need from San Quentin prison at six cents.

Southern California

The first asparagus out of Imperial Valley commanded $19.20 per crate.

Orange men are wishing for rather better prices than have prevailed this season.

The first asparagus of the season was shipped from Imperial Valley February 16.

During 1914 the California highway commission let 153 contracts for approximately 1200 miles of road.

The tuna fish pack of the Calfornia coast this year reached 300,000 cases, more than double the pack of 1913.

Heber, Imperial County, made a record early shipment of green peas, nearly six weeks earlier than former seasons.

The Cotton Growers' Association of Calexico is protesting against the assessment of two dollars per bale on stored cotton.

The Imperial irrigation district has resolved to employ its own people to do as much of the levee and canal work as possible.

Dairymen of Southern California are to meet in Los Angeles this week and discuss the matter of threatened reduction in prices.

The irrigation district formed in the Palo Verde Valley has agreed on a price of $123,710 to be paid the water company for a protection system.

Francis Cuttle of Riverside, and one of the stand-bys of the Tri-counties Reforestation Committee, has been endorsed for a place on the State Water Commission.

The little Santa Clara River in Ventura County has been returned within its proper banks. Since the recent storms it has been overflowing and in one section made a new channel.

Coalinga, Fresno County, now wants to be known as an agricultural center as well as an oil town. Nearly 40,000 acres of grain have been planted this season in the district about the town.

A corporation has been formed in Lordsburg, Los Angeles County, to manufacture culls and low grade lemons into lemon oil and citrate of lime. The United States now imports annually $1,500,000 worth of these two products from Italy.

Judges at the National Orange Show at San Bernardino were State Horticultural Commissioner A. J. Cook, B. A. Woodford, formerly manager of the California Fruit Growers' Exchange, and W. L. Moulton, who was judge at the first show held in 1911.

According to United States government statistics the annual yield of cotton per acre in the Imperial Valley is 500 pounds. This is the record for the whole United States. The state making the next best showing is Missouri, where long staple runs 325 and shorts 295 pounds per acre.

On the afternoon of Washington's birthday, at the National Orange Show at San Bernardino, Dr. Webber, head of the citrus experiment station at Riverside, delivered the address on the 40th anniversary of the planting of the first Washington naval orange trees in California.

The Coast

About 2000 acres of sugar cane will be planted near Chandler, Arizona, this spring.

Markets generally in the Northwest report potato marketing conditions in bad shape.

North Yakima, Washington, is to have a new $10,000 cannery erected within a few weeks.

A carload of 40 burros was shipped from Tucson, Arizona, to the Panama-Pacific, San Francisco.

One citrus ranch at Yuma is shipping 50 boxes of oranges and grape fruit to Los Angeles every week.

The Idaho legislature has appropriated $10,000 for the Northwest Live Stock Show to be held at Lewiston.

A Chicago mail order house has just purchased 10 tons of dried loganberries from a firm in Salem, Oregon.

The Washington state board of control has fixed seven cents as the price to be charged for grain sacks this year.

The reclamation service is doing some magnificent work in the encouraging of argicultural education in Arizona.

Jersey cattle owners of Lane County, Oregon, have organized a Jersey cattle club for the purchase of pure bred sires.

Car lot shippers of poultry, eggs and butter in Texas met at Wasco last week to form an organization to aid in marketing their products.

Roosevelt Lake now contains over 800,000 acre feet. The engineers predict that before the season's rains are over it will contain nearly 1,000,000 acre feet.

Montana wool growers are being urged to hold on to this year's wool clip to secure advantage of the good prices which war conditions are expected to bring.

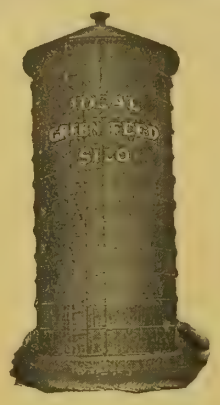
The business men of Arizona have formed a state association for the purpose of furthering cooperation among the merchants of the state and for the maintenance of a state bureau of credits.

The Oregon Cattle and Horse Raisers' Association has just closed its annual session at Prineville. Three hundred and twenty-nine members were present, representing over 100,000 head of stock.

Fruit growers of the Pacific Northwest met recently at Tacoma, Washington, and elected a Growers' Board of Control consisting of John F. Davis, Opportunity; Clifford E. Chase, Wenatchee; Harry Jones, Wapato, Washington; A. D. Moe, Hood River; A. W. Simmons, Freewater; J. A. Westerlund, Medford, Oregon; E. C. S. Brainard, Payette, Idaho; W. M. Sackett, Corvallis, Montana.

The central body of the Wenatchee-North Central Washington Growers' League has been formally organized by delegates from each north central Washington precinct. A governing board of nine was selected. This is the final step in the growers' movement which has for its object tying up the fruit tonnage of the entire district to the one organization and the regulation of the selling agencies.

WHAT DOES A SILO COST?



AN IDEAL GREEN FEED SILO will pay for itself the first year. That being the case it will cost you nothing.

AS A MATTER OF FACT, THE COST of a silo is really a secondary consideration, because if you are keeping dairy cows or raising stock for the market, there is no investment which you can make which will pay you better returns than an IDEAL GREEN FEED SILO.

A GOOD SILO IS A NECESSARY PART of the dairy equipment of every cow owner or stock raiser who wants to realize a reasonable profit from his herd, and if the matter of cost has been standing in your way, please remember that it is really not a question of whether you can afford to erect a silo, but whether you can afford to do without one.

IF YOU HAVE NO SILO a little investigation will be sure to convince you that you ought to purchase an IDEAL GREEN FEED SILO right away, and be prepared to save your first cutting of alfalfa. Then plant corn to fill it again this fall.

Write for new Silo Catalog for full information.

Live Stock and Dairy

THE FEEDING PROBLEM

Written for California Cultivator
By Leroy Anderson

WHY should there be a feeding problem? When the state is having one of the biggest and most timely rainfalls in its history and when barns, warehouses and stacks are bursting with the biggest holdover crop of hay that California has known, why should anyone worry about stock feed in 1915? Troublous times in Europe have much to do with it. There are many dairymen who depend upon grain as a staple food for their cows and then there are the pigs to be fattened. Europe's demand upon our supply of wheat has sent the market value of that cereal soaring, and along with it, wheat bran, middlings, etc. Barley, which was begging buyers last July, has been caught in the basket of the wheat balloon. The situation puts a twofold aspect upon 1915 operations, to so plan feeding arrangements as to purchase as little grain as possible and, if one is raising any grain, to sell as much as possible without injury to the stock.

The plenteous rains that have been falling with slight intermission since the first of December assure a rank growth of all kinds of volunteer feed. The spring promises as much of this kind of feed as we had in 1914. Is it to be handled in the same way as last year? Some dairymen have learned the lesson and are prepared to profit by it, but the majority are probably unprepared. Last May I enjoyed a trip through the Sacramento Valley and had an opportunity to see the state's biggest hay crop in the harvesting. I scarcely imagined that even fertile California could yield such a whopping crop. But it surely lacked in quality even though abundant in quantity. Every kind of seed in the soil had grown luxuriantly, and the hay was truly mixed barley, wild oats, tame oats, burr clover, foxtail, alfilaria, and if it happened to be an alfalfa field, there was some alfalfa present with all the rest. To cap the climax, comparatively heavy showers came along in late May and early June with the result that this coarse hay was stained and darkened and ruined for any first class market.

What local market there was for the hay would scarcely pay for cutting, curing and hauling. Some alfalfa mills offered $4.25 a ton and that for fairly good alfalfa. Yolo County ranchers sold what they could in the cock at $3.00 a ton. Near Gridley a baling outfit was baling some coarse volunteer hay and one of the attendants said he could buy all he wanted of that kind at $3.00. The picture was not all as dark as that. A Gridley dairyman said he had delivered first cutting alfalfa in town at $8.00 a ton. Another had sold his in the stack at $5.50 to a neighbor for feeding beef cattle. A Gridley liveryman was paying $5.00 in the cock for barley hay. But these fair prices were for good hay and clean—really the kind that the name implied.

Silo Salvation

It is not too late to prepare for that big crop of mixed stuff that is surely coming on many a stock ranch this spring, and by stock I mean dairy as well as beef cattle and sheep. The best way, and I guess the only way, to get the most value out of the crop is to put it into a silo. It was a decided pleasure to hear Mr. J. S. Glide of Yolo County tell his experience with the silo. It had then (June, 1914), been filled with the first cutting of alfalfa and some volunteer stuff similar to that described above. This would be fed out during the summer to young beef stock and to sheep and lambs. The silo would doubtless be empty in time for the corn crop to go in. Mr. Glide is not a dairyman and he believes the silo more than worth while for the strictly stock man. He said the stuff he put into the silo in the spring would have been worthless as hay, especially with the rains coming as they did. In fact, a neighbor wanted him to take some hay of that spring cutting but Mr. Glide did not consider it even worth the hauling.

It must be about a decade ago that Mr. Henry of the Atascadero ranch in San Luis Obispo County became interested in the silo. He was also a beef cattleman with a ranch of 20,000 or more acres. Nearly every spring he was faced with a rich growth of wild oats, alfilaria, foxtail, burr clover and the like, which seemed to him would be of more feeding value if it could be preserved in its succulent state rather than if it were allowed to dry up or be trampled down by the stock. So he erected silos, several of them, and became a convert to silage for beef cattle. I have cited these two instances because the silo is usually thought of as a dairyman's property, and if progressive men who are raising beef find it of value, how much more will the dairyman be benefited by it.

I know how difficult it is on a ranch to do all the things one wants to do and to make needed improvements that require money. My present ranch life gives me a warm fellow feeling for all similarly situated. But what are we going to do with this first spring hay crop? We want to make the best feed possible out of it, and we want to spare the market that much poor hay. We also want to spare our cows that poor hay. If the ranch is paid for or nearly paid for, one can afford to borrow money enough to pay for a silo. In fact, so urgent is the matter that in the face of much debt one could afford to still borrow for the silo if credit could be secured. Each dairyman must have a silo of his own, but for engine and cutter he can, in this day of farmers' organizations, join several of his neighbors and thus save individual expense. The fact is that the silo itself is only about half the layout for engine and cutter cost as much as a good sized silo, and the machinery ought to be made to serve several silos.

Harrow the Alfalfa

But if the silo cannot be built this spring be sure to make the first cutting of alfalfa as good in quality as any later cutting, barring rains. Now is the time when the ground is moist to give the alfalfa a thorough harrowing. A strong spring-tooth is the best tool, and set it to go three or four inches deep. Harrow and cross-harrow until you think there is no alfalfa, for none can be seen because of the looseness of the soil. This will kill all foxtail and all weeds that grow faster than alfalfa in the cool weather and insure a clean crop of hay. If the stand of alfalfa is not thick it will be a good plan to sow barley before or during the harrowing. Thirty or 40 pounds to the acre will give a good yield of hay with the first cutting of alfalfa and make a fine feed for the horses as well as cows. Moreover if soiling is practiced one is thereby assured of a good yield of green feed early in the season. Oats are now not much higher than barley and will do to sow. They are of slower growth and may not be sufficiently mature for hay when the alfalfa is ready, but they will probably give as much green feed as barley.

Soiling

Speaking of soiling reminds one that this practice is one of the means of making a given area of land feed more cows and also a means of affording that variety in feed that progressive dairymen are feeling is of prime importance. If the variety can be provided in crops grown on the ranch the necessity of buying grain and mill feeds is greatly lessened. The plant that yields the greatest tonnage per acre of the best ration is doubtless alfalfa. Dairymen who practice soiling use this as the basis for summer feed as well as for hay for winter. A

When writing advertisers, mention the Cultivator.

notable example is Mr. H. R. Timm of Dixon, who by his admirable management cuts green alfalfa from March to December. His 200 to 300 cows do no pasturing whatever, but fresh alfalfa is brought to their racks daily. Alfalfa by this practice is longed lived because the crowns are not injured by animal hoofs and too close cropping is prevented.

Alfalfa grows so easily after once established that one is prone to depend entirely upon it, and not provide the needed variety. Now is a good time to be looking out that the summer finds a few other things growing. Oats and peas form one of the best combinations for winter planting. If the region is one of cool springs the Canadian field pea is good, but if the warm weather comes soon probably one of the cow peas would be better. They are best sown mixed and drilled in, though broadcasting and harrowing in will do if followed by showers to insure sprouting. One bushel of each per acre should give a good stand, which means 35 pounds of oats and 60 pounds of peas. Begin cutting when the oats are heading and feed green. This combination is an excellent forage for hogs. If all cannot be fed green make the balance into hay which is good for cattle, horses and sheep. Better than to have much hay of this sort would be to sow at intervals in smaller quantities up to possibly the last of March.

Another combination which I found used by a Butte County dairyman was sorghum and barley. Since this was ready for the first cutting in early June it must have been sowed in April. By irrigation the sorghum produced two more crops of forage that year. Early Amber sorghum is a favorite variety and may be sown as soon as frost danger is past up to July where irrigation is possible. This is a common crop in Imperial Valley. Where the seed is drilled from three to six pounds is used per acre and where broadcasted from six to 15 pounds. In that section it is sown in warm weather and after being pastured is irrigated and another crop comes on quickly. If cut for soiling the same continued growth might be expected. If water be not so plentiful as in Imperial Valley it would be better to plant in drill 30 to 36 inches apart and cultivate. Then moisture would be conserved and a better feeding stalk secured. In April, 1913 the writer planted in Riverside County several acres of milo maize, one of the non-saccharin sorghums. It was planted for the grain but as warm weather approached Johnson grass appeared in such quantity as to make grain production too expensive as to cultivation. When the milo maze was about 18 inches high the cows were turned in. They soon ate maize, Johnson grass and all. The land was then irrigated and in three weeks a second crop was ready for pasture. Still a third crop was available in the season.

This is wandering a bit from soiling. Maize, or Indian corn, is a common soiling crop in the East, but I believe for irrigated California it is not equal to the sorghum because it does not grow up after cutting as do the surghums. For siloing it beats them all, but for summer soiling it is not so good. Therefore I have referred to summer crops and soiling where irrigation is possible. In a later contribution non-irrigated or single annual crops will be discussed together with feeding of various grains and grain products.

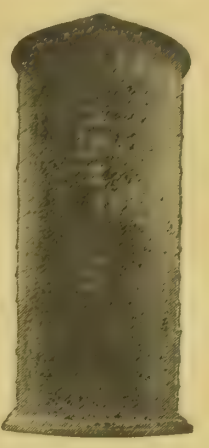
We have letter from Mr. H. L. Murphy of Perkins, Sacramento County, in which he refers to a trip he is about to take to Nebraska to secure a bunch of Shorthorns and Hereford bulls. He has opportunity to get some of the finest stock in the United States and is going to bring a number of youngsters and mature animals which will add to the worth of California's ranches.

Cattle feeding will enable the manager to dispose of his surplus feed in a profitable manner, afford more barnyard manure with which to enrich his land. It will also be the means of diversified farming in which rotations may be planned, not only to supply a variety of feed for the stock, but also with special reference to improving the fertility of the soil.

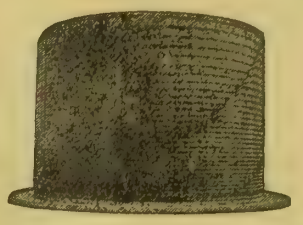
SILOS

BUILT FOR YOUR PARTICULAR NEEDS,
EXACTLY AS YOU WANT THEM.
ALL SIZES AND DIMENSIONS

16 x 36 Redwood Stave Silo manuafactured by us for the Panama-Pacific International Exposition, San Francisco, 1915



TANKS



Built to order, to suit all uses and users. Cheaper than metal tanks, last longer. Won't rust. Can be taken down and re-erected without damage. Capacities, 500 to 500,000 Gallons. Towers included if you want them.

PIPE

MACHINE BANDED OR CONTINUOUS STAVE

For water supply—irrigation or power. Cheaper than any other pipe of equal size or capacity. Longer lived than any metal pipe except cast iron.

All our silos, tanks and pipe are designed by engineers to meet every condition. Made in our big factory from CLEAR, AIR DRIED REDWOOD. Selected from a stock of 40 million feet which we carry at all times.

COW'S INDIVIDUALITY

It is still possible to find dairymen who never dig deeper than the surface knowledge of the whole herd giving so much milk, counting simply the total weight sent to the factory one day, or per month, or again simply the average yield per cow for the factory season.

A plain fact that cannot be impressed too strongly is that cows have individuality; people have personality. What makes two cows yield quite different weights of milk and fat when all conditions are practically equal? Even supposing a cow's interior economy were made visible and luminous, has any man the requisite knowledge to fathom all the mysteries of milk-manufacture?

We do know this, the yield of milk and its percentage of fat are apt to vary from day to day most strangely. The first half of the milk drawn may not contain more than half as much fat as the latter half; the cow may have some slight sickness; some of her delicate nervous functions may be deranged temporarily; extremes of weather, undue exposure, excitement, may all influence the yield of milk and the test. Hence it is clear that the sensible way to judge a cow's performance is not by any one test or weight, but rather on her total yield for the season. A cold, matter-of-fact "average" does not give necessary information, cows have individuality, which is worth studying so that they may repay their owners for intelligent handling.—C. F. W.

L. A. CACTUS & STOCK RANCH
Room 605, 444 S. Broadway, Los Angeles

The spreading of rabies by infected coyotes among cattle grazing in the national forests has assumed a grave aspect, according to a report received by the forest service from the district forester in charge of the forests in Washington and Oregon. Numerous townships in eastern Oregon, it is reported, have ordered that all dogs be muzzled lest those that have been bitten by rabid coyotes develop hydrophobia and attack humans or domestic animals.

Efforts are being made by the state authorities of Oregon to stop the spread of hydrophobia by this means, and officers of the forest service are cooperating in attempts to kill off the coyotes. In one county alone a loss of 300 head of cattle is charged to rabid coyotes.

The good milker must have a natural disposition to convert her food into milk and then her ration must be a milk-producing one—not one for growth nor to fatten, but one which will make her produce rich milk.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Injury to Foot

I have a three-year-old colt that cut his hind foot six weeks ago. It was a flesh wound on the back of the foot but did not cut the hoof. It is partly healed but leaves a large lump, and the hoof seems to be growing out directly under the lump. The sore looks like proud flesh. He is not lame but rests the foot a great deal. A blacksmith tells me that the hoof is sound. What can I do to cure him?—Subscriber, El Centro.

The hoof is probably all right. The trouble is with the cartilage inside the hoof. Get two ounces of nitric acid and apply some of it to the spot that looks like proud flesh. This will form a scab. When the scab comes off repeat the application of acid. Two or three treatments should be enough. Apply the acid with a swab and be careful not to let it touch the hands or clothing.

Bad Blood.

I have a four-year-old colt that about six months ago had a large lump or boil form on the end of his shoulder. Thinking it was a fistula I put medicine on it and it went away without pus forming. Then about two months ago he had a large swollen ankle and was very lame but got all right in a few days. Now he has a large swelling on the inside of his thigh, one in his flank and one under his belly. They are not very hard but sore and he walks stiff. He is fat and seems healthy every other way. Please give cause and remedy.—Subscriber, Encinitas.

Thin his blood by giving the following: Epsom salts, three pounds; common salt, one pound; powdered gentian, six ounces, and powdered nux vomica, three ounces. Mix and divide into 24 powders. Give one powder every night.

Barley Beards

I have a horse that is not a very good eater. When I give him barley hay he does not even look at it for a while. Sometimes he stands and chews and licks until a white foam comes around his mouth. Do you think there is anything wrong with his teeth or internal organs?—Subscriber, Ripon.

The trouble is all in his mouth. Probably there are some barley beards under his tongue that he can not get out and others may be sticking in his gums and side of his mouth. Have a good veterinarian clean out his mouth and fix his teeth.

Dyspepsia

I have two Jersey heifers, bred about two months, in good condition. They are fed on good alfalfa hay but lately have taken to eating the wood from their manger and even clipping the hair from each other and eating it. I give them salt occasionally. Will you kindly advise what to do for them?—Old Subscriber, Ontario.

Change the feed. Give oat hay for a time or corn fodder if you can get it. Have your druggist prepare this medicine: Aloin, three ounces; turpentine, one pint, and raw linseed oil enough to make two quarts. Mix, shake well and divide into ten doses. Give each one a dose every other day. After giving that have this medicine prepared: Powdered gentian, eight ounces; powdered nux vomica, four ounces; bicarbonate of soda, eight ounces, and calcium phosphate, one pound. Mix and give each one a large tablespoon once a day mixed with bran.

Barn Over Line

A's barn is three and one-half inches over on B's lot and B wants A to move it. B says when he gets ready to build his barn he will saw off A's barn. Would B be liable to A for damage? B tried to buy A out, but could not, so would like to know the law on this point.—Subscriber, Caruthers.

If the barn was willfully built upon the property of B it is a nuisance which B may remove by destroying it, if he may so do without committing a breach of peace or doing injury otherwise than as to the part projecting. Probably the safest way would be to bring action to compel the removal, for where the encroachment is slight and made in good faith under mutual mistake as to the boundary line, it has been held there is no right of removal, but in such case B would probably be entitled to damages for value of the land.

Collecting Note

In March, 1914, I bought lumber for a house and made a cash payment with the understanding that I would pay the balance out of crops I was raising. My crops were a success, but owing to a very low market I could not meet the balance of the money due. I went to the lumber company and stated my case and offered to make a note settlement for four months. They accepted the note. My interest in home is less than $5000. When the note is due, if I cannot pay it, can the lumber company put a lien on the house or land and collect? —Subscriber, Yucaipa.

In the above case the material man lost his rights to a lien, because not filed within 90 days, and in the second case has waived his claim thereto by accepting note. If you do not place a homestead upon the property, the material man can nevertheless attach same under the note.

Witnessing Will and Deed

Does the California law require a deed or a will to be witnessed in order to be valid? If so, how can a deed already recorded (not witnessed) be corrected?—Subscriber, San Diego.

A deed does not have to be witnessed, but to entitle it to be recorded it must be executed before a notary public. A will entirely written, signed and dated in the writing of the testator does not require to be witnessed. The common form of will requires two witnesses.

Settling Estate

What is the best way for a man and wife without children to settle their estate so one may have it all in case of death of the other, and so there may not be heavy expense and interference of relatives? The estate in question has all been acquired since marriage.—Subscriber, Imperial.

The estate having been acquired since marriage, upon death of the wife the husband takes without administration. To secure the wife's interest a will made by the husband to her will in the end be the least expensive.

Collecting for Service

A owns a stallion, B breeds his mare, signing the following form of note. "April 5, 1914. For services rendered, I promise to pay A or his assigns $20 when above mare proves to be in foal or before mare changes ownership, is mortgaged, or leaves the county. (Signed) 'B.' "

When does this note become due? Can A attach mare for debt if mortgaged or is taken out of the county without permission? Can A take the colt, and when? Is the above form of note O. K. or is it faulty?—Subscriber.

The note set forth is faulty in that the time specified as to when it shall become due might never arrive. It is in fact no more than an I. O. U. A could bring his attachment suit, but the suit would be subsequent to any mortgage lien. A should have insisted upon the lien to which he was entitled for the service of his stallion, but this right of lien he has lost, as to enforce such lien he must within 90 days after service file his verified claim with the county recorder, containing a description of the mare, the date and place of service, the name of the owner and description of the stallion, the name of the owner or person in charge thereof and the amount of lien claimed. Now he will probably meet with the difficulty on attachment suit that the mare is exempt from execution.

Road Right of Way

A and B have places adjoining. A has to cross B's place to get to county road. Twenty years or more ago the former owner of A's place fenced off a 60-foot roadway along line of B's place to get to county road. That road has been opened since with no objection from owners of B's place so far as A can learn. Both of these places have changed hands since road was opened. A has used the road without objection for the last three years. There is a gate on line fence between A's and B's places that is used only by A when he wants to keep stock out of his place from road. Can B close this road? C A go ahead and grade, etc., and be assured that road will not be closed in future?

It is probably true that you, together with your predecessors in interest, have acquired a prescriptive right to the use of this road in the condition in which it at present is; such right, however, would not permit you to grade the road or in anywise change it.

Self Defense

Does a man have a right to shoot a robber in a house or making an entrance to the house? What will be the result if a man meets with a "holdup" and he shoots the thief?—Subscriber, Oregon.

Homicide is justifiable when committed in resisting an attempt to murder any person, commit a felony, do some great bodily injury or in defense of the habitation, property or person against one who endeavors to enter the habitation for the purpose of offering violence or committing a felony. The circumstances must be sufficient to excite the fears of a reasonable person and the party killing must have acted under the influence of such fears alone.

Trees on Line

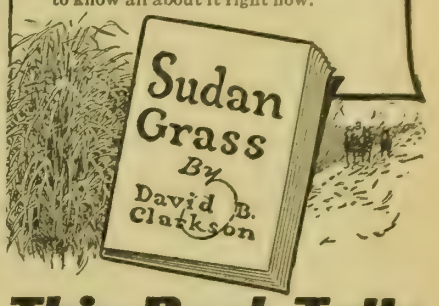
A recently bought a ranch improved some years ago, on a little used crossroad with a row of large eucalyptus trees bordering the road. B owns 10 acres of the new land on opposite side of road. A cut down and hauled away eucalyptus. Now comes a letter from a lawyer demanding payment for B's share, she claiming they were on the line. How should A proceed? Must B prove claim by survey and is A obliged to share expense of survey?—F. D., Kingriver.

It is always necessary for the plaintiff to prove his claim before the defendant is put upon his proof; so that A in this case would not be obliged to share any expense of this survey.

(Continued on Page 287)

SUDAN GRASS

has proved to be the most profitable forage crop ever grown in America. Farmers who have planted it are making $20 to $100 an acre on hay, and from $300 to $700 an acre on seed. It yields the biggest tonnage to the acre of any high-class hay known. If you plant Sudan Grass, you never have to buy feed for your stock. As a catch crop, it turns loss into profit by replacing crops that have failed because of drouth or flood. By rotating it with other crops, you conserve and increase the fertility of your soil. Sudan Grass is one of the big factors that are bringing prosperity to the South. You ought to know all about it right now.



This Book Tells All About It

I am the largest grower of Sudan Grass in America, I have studied it for years. This book contains everything I have learned about Sudan Grass. It is complete and absolutely reliable. It is the first and only book ever published that tells all that is known about Sudan Grass. Profusely illustrated with actual photographs of growing, harvesting and threshing Sudan Grass.

Prof. B. Youngblood, Director of Experimental Stations for the state of Texas, says—
"Mr. David B. Clarkson: "I have read your new Sudan Grass book. Glad to note that it brings forth the most comprehensive and authoritative information on Sudan Grass as yet published in book form."

Don't Start Wrong! —Don't commence growing Sudan Grass until you know how to secure, grow and keep seed pure, how and when to plant, where and on what kind of soil it will grow, how to cultivate and harvest for hay and seed, how to thresh, and all other particulars. My book tells you everything.

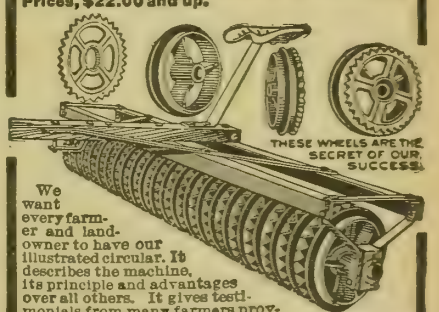
A Wonderful Book for 10c

This book may prove to be worth thousands of dollars to you. I want every American Farmer to know all I know about Sudan Grass. Merely send your name and address, with 10c, to show that you are seriously interested, and I will send you this book postpaid. Send 5 two-cent stamps or a 10-cent piece. Address P. O. Box 174

David B. Clarkson, Robstown, Texas

3 MACHINES IN 1

A perfect seed bed is as important as to sow or plant. The Western Pulverizer, Packer and Mulcher makes a perfect seed bed and leaves a loose mulch on top to retain the moisture in one operation. It will double profits on crops. Made in 8 sizes. 1 and 3 sections. **Sold direct to you on one year's trial. Prices, $22.00 and up.**



We want every farmer and landowner to have our illustrated circular. It describes the machine, its principle and advantages over all others. It gives testimonials from many farmers proving what it will do on wheat, alfalfa and other crops. It contains valuable information on how to prepare the soil for better results. Send for this circular today, whether you want to buy or not.

WHAT IS WHITE DIARRHOEA?

Written for California Cultivator

By Jean A. Koethen

IF I were able to say exactly what white diarrhoea is, I should be wiser than most of the experts who have been studying for years to find out. It is possible, however, to give a pretty fair guess at what it is not and to summarize the results of investigation according to the latest published statements.

White diarrhoea first of all is not the ordinary diarrhoea which attacks baby chicks which have been chilled or improperly fed. When chicks are placed in a brooder which is not warm enough for them, or chilled on their way to the brooder, or, if they are with a hen, allowed to run on the damp ground or in wet grass within a few days after hatching or exposed to a chilly wind, there is apt to appear a brownish discharge from the vent which sticks to the feathers and often pastes up the vent entirely. This is not white diarrhoea, but an indication that something is wrong in the care of the chicks—usually it is lack of sufficient warmth—and can often be cured, if taken in time, by removing the cause. As soon as there is noticed the slightest symptom of this sort the chicks should be given more heat. If they are with a hen, and she is failing to hover them properly, she may often be compelled to do her duty by confining her to the coop. Darkening the coop will also help to keep her quiet. Boiled rice, if the chicks will eat it, is a good diet for chicks affected in this way, but I have found that when they have been started on other fare they usually refuse the rice at first. Sour milk is even better than rice, and this, mixed with rolled oats or used to moisten dry bread, is something only a very sick chick will refuse.

One cold spring day a neighbor of mine stopped to show me the fine little chicks she had just bought at a downtown hatchery. They were in a pasteboard box, with holes for ventilation, and not a scrap of anything warm under or over them. While we talked the box stood on the step in the wind. These chicks, a dozen perhaps of them, were given to a hen that already had a dozen of her own and placed in a wire run in the garage. It was cold, rainy weather, mind, and that hen had not a corner where she could protect those 24 chicks—just the roof of the garage over her and her two wings. Next day when I went to see them one or two had already dropped off and others were pasted up, while the owner wondered what was wrong with the feed that those chicks should get "white diarrhoea." I suspect that great as are the crimes which may justly be laid at the door of white diarrhoea, much of what is proclaimed as white diarrhoea and blamed on an inscrutable Providence is nothing but a digestive disturbance due to lack of proper care and warmth.

Only once have I seen a case of what I thought could rightly be called white diarrhoea. That was in two or three chicks that were hatched by one of my own hens from a ten-dollar setting of eggs that had traveled several hundred miles. The discharge in this case was a peculiar, shiny white, and the chicks seemed to suffer considerably and to grow old and pinched looking in a few days. They died, of course, but I have never had another case in my flock.

Now white diarrhoea proper is a germ disease and comes from infection. It may be infection of the yolk of the egg from the very hen that laid it, or infection of the outside of the shell from a germ found lower down in the egg passage, or it may, in other forms of the disease, come from other parasitic organisms. This is what makes the study of white diarrhoea so difficult. Infection may come from this or that or the other thing, and it is very difficult if not impossible to know just what the contributing cause is, for the symptoms are about the same in either case. The Maine station's pamphlet on poultry diseases mentions three organisms which are believed to be specific causes of white diarrhoea; (1) coccidium tenellum, which produces the disease called coccidiesis; (2) bacterium pullorum, producing the disease commonly known as "bacillary white diarrhoea," and (3) aspergillus fumigatus, producing aspergillosis or brooder pneumonia.

The organisms which produce coccidiesis may exist in the intestines of pigeons, rabbits, rats, mice and all kinds of domestic fowls. Pigeons are particularly susceptible to them, and it seems quite likely that infection is often carried by them to poultry yards. These coccidia, if taken into the digestive system of adult fowls, sometimes cause a chronic disease and thus infect the egg, I suppose on the outside, and produce in chicks hatched from such eggs a disease which is not distinguishable from other forms of white diarrhoea. Dipping the eggs in grain alcohol before they are put in the incubator or under the hen, and thoroughly disinfecting the incubator between hatches ought to prevent this form of the disease among baby chicks.

Bacterium pullorum is, so to speak, the "real thing," the cause of what is known as bacillary white diarrhoea. Probably the majority of deaths from white diarrhoea are due to this malignant organism. Professor Rettger of Yale University and Professor Stoneburn, formerly of the Connecticut experiment station, have done more work on this disease than has been done by other investigators, and in Bulletin 68 have tabulated briefly the results of their study as follows:

The original source of infection is the ovary of the mother hen.

Eggs from infected hens contain the organism in the yolks.

Chicks produced from infected eggs have the disease when hatched.

The disease may be spread through the medium of infected feed and water. Hence normal chicks may acquire it by picking up infected droppings or feed contaminated thereby.

Infection from chick to chick cannot apparently take place after they are three or four days of age.

As a rule infected chicks make less satisfactory growth than those that

Don't Forget

That care in selecting the grain you are going to feed your baby chicks will save you lots of trouble and loss. The ingredients of

Coulson's MADE IN PETALUMA

Special Chick Food

are very carefully selected to give the best results.

Only strong wheat, sound corn, kiln dried steel cut oats and carefully selected seeds are used in its composition.

are apparently normal. For some time they appear stunted and weak, but may eventually undergo more or less complete development.

The female chicks which survive often harbor the infection and may become bacillus carriers. Infection in the breeding pens is perpetuated in this manner.

In all probability infection does not pass from adult to adult.

Infected hens are apparently poor layers, especially in their second season and subsequently.

The symptoms of bacillary white diarrhoea do not differ greatly from those of ordinary diarrhoea, save that they are more pronounced. The affected chick is drowsy and miserable, usually refuses to eat and stands in a corner, either peeping or apparently asleep. Very often the back seems to shorten and the abdomen to protrude. Death occurs within a day or two.

Professors Rettger and Stoneburn suggest that treatment must be mainly preventive. Infected hens should be eliminated from the breeding pens. These infected hens can, of course, only be discovered by a careful system of pedigree breeding, each hen's chicks being hatched by themselves. If this is not practicable, and infection is known to exist in the flock, the eggs should not be used for hatching. Sometimes infected hens may be picked out by making an incision in the side similar to that made in caponizing, and examining the ovaries, but this is an operation an ordinary poultryman would hardly care to undertake. The following suggestions for treating the disease when discovered and preventing infection are worthy of careful consideration:

Incubators, brooders and all other appliances used in the hatching and rearing of chicks should be cleaned and disinfected frequently.

Feed and water should be applied in such a manner as to prevent contamination with infected droppings. The use of fine absorptive litter in the brooder, especially for the first few days, is also advisable.

The feeding of sour milk may prove very effective as a preventive measure. The milk must be fed early, or during the infection stage. After the white diarrhoea organism has once entered the general circulation such treatment is of little or no value. Hence sour milk should not be looked upon as a cure, but merely as a possible preventive agent.

Since perfect physical condition is as a rule a barrier to disease it is important that the health and vigor of the breeding stock and chicks be raised and constantly preserved. Proper methods of housing, feeding, incubation, breeding and management should therefore be employed.

Brooder pneumonia, the third form which white diarrhoea may take, is caused by the growth of the aspergillus fungus, or mold germ, in the lungs. Dr. Salmon says: "It is believed that it may occur from infection carried within the egg. Whether this infection is derived from the hen or from the material in which the eggs have been packed is not definitely known, but the latter method of infection is the more probable. The fact of the lungs being the principal seat of the infection indicates that the spores in most cases are inhaled with the breath and germinate at or near the points where they are deposited. The inference from this method of infection would be that the incubators or brooders or both had been allowed to get filthy or moldy and that the atmosphere in these was filled with aspergillus spores." The symptoms are similar to those of bacterium pullorum but the breathing is more rapid and difficult. There is usually the same white diarrhoeal discharge.

I do not know how common white diarrhoea is in California. It is said that the country over it destroys more than 50 per cent of the chicks. If this is true, and the statement seems very large to me, it certainly points to a deplorable disregard of sanitary laws. I am inclined to think, however, that much that has been reported as white diarrhoea was not, and that, since the knowledge of the character of the disease has been so widely disseminated, it must soon be reduced to occasional sporadic appearances like chicken pox and gapes. Life of any sort is too valuable to be wasted in such a careless manner.

SUCCESS DEPENDS UPON WORK NOW

This is one of the most important seasons of the year in the poultry yard for it is during this season that the flock should be renewed. Much of your success next year depends upon the flock you raise this year. A little care now in selecting, mating, incubating, and breeding, will do much towards making an active, healthy, vigorous, profitable flock.

Upon placing a male with hens which have not had a male with them, the eggs become fertile in about three days and remain fertile for 15 to 20 days after the male has been removed.

If the eggs are infertile the birds should be examined. Collections of louse eggs on the base of feathers or the accumulation of droppings on the feathers about the vent, often prevent the proper communication between male and female.

An 80 per cent fertility and 80 per cent of the fertile eggs hatching is considered a reasonable hatch. This means 64 chicks out of 100 eggs set or about 10 chicks out of a setting of 15 eggs.

If the eggs are to be held before setting, they should be kept at a temperature of from 40 to 60 degrees and should be kept covered so the albumen will not evaporate.

When the chick comes out of the shell it is made out of the albumen or white of the egg and has used little or none of the yolk. If the albumen has evaporated too much, there is not enough material to build a chick large and strong enough to get out of the shell. This is one of the causes for chicks dying in the shell. This evaporation may take place either before or during incubation.

Early hatched pullets mature and begin to lay before winter begins. They make good winter layers and are good breeders the following spring while the late hatched pullets do not lay before spring and if used in the breeding yard, produce a low per cent of chicks which are small and weak.

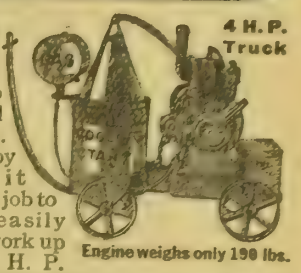
It is advisable also to rear the entire flock as near the same time as possible, for in flocks where there are chicks of all ages, the youngest ones seldom amount to anything. Then, too, if they are all reared in one brood it takes only a short time till the chicks are large enough that they need very little attention. On many farms only a small number is hatched at a time, requiring almost the entire summer of work and worry to renew the flock.—C. T. Patterson, Missouri Poultry Experiment Station.

Tells why chicks die

E. J. Reefer, the poultry expert of 805 Main St., Kansas City, Mo., is giving away free a valuable book entitled "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

Light Weight Cushman Engines For All Farm Work

This Light Weight Cushman Truck is so handy for all power work. So light a boy can pull it around from job to job, yet it easily handles all work up to 4 or 4½ H. P.

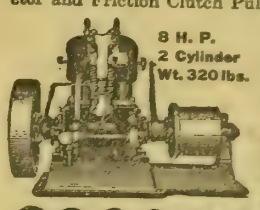


Engine weighs only 190 lbs.

Runs at any speed desired, speed changed while running. Pump circulation to water tank prevents overheating, even on all-day run. All Cushman Engines are

Throttle Governed—Steady and Quiet

No jerky, explosive hit-and-miss running. They are the **most useful engines** for farm work, as they do everything the big fellows do and so many jobs big engines cannot do. May be attached to binders and other machines as power drive. Equipped with Schebler Carburetor and Friction Clutch Pulley. **Not a cheap engine**, but cheap in the long run. Sizes 4 to 20 H. P.



Engines Distributed from Pacific Coast centers. Write for free Engine Book.

POULTRY

Just Out—The Cultivator Poultry Book, "Poultry for Profit," by Jean A. Koethen. Published by the Cultivator Publishing Co. Highly endorsed by experts. Over 200 pages, 50 illustrations. Contains simple methods of avoiding and overcoming difficulties. A guide to poultry success under Western conditions—it tells what to do, why to do it, and how to do it. Nicely bound in cloth. Price $1.00 postpaid, or with Cultivator one year, $1.75. Send orders to Cultivator Publishing Co., 115-117 North Broadway, Los Angeles, Cal.

White and Brown Leghorns—Day-old chicks from healthy vigorous breeders. "Chicks well hatched are half raised." We will be pleased to send you circular and prices. San Jose Hatchery, 371 Meridian Road, San Jose, Cal.

Poultry—Rhode Island Red Chicks $15.00 per 100. Settings, thousands, from our 1800 heavy layers. Hatched right in our $60,000 Hatchery. Hatching Eggs. Pebbleside Poultry Farm & Hatchery, Sunnyvale, Cal.

Ancona Eggs—Select stock, $1.50 per 15, $7 per 100. Baby chicks, 15c each. Mammoth Pekin Duck Eggs, $1 per 12, $6 per 100. Baby ducks, 20c each, $17.50 per 100. J. P. Clough, 3980 Peralta Ave., Fruitvale, Cal.

Trapnested White and Buff Leghorns, records 120-279 eggs per year. Eggs, chicks, stock. Arthur R. Schroeder, R. 18, Box 179-D, Mountain View, Cal.

Pit Games—A few choice specimens for sale. Write for prices. Delivered your station. O. L. Crane, R. D. 3, Santa Rosa, Cal.

Pheasants—Ringneck and Golden. Eggs for hatching. T. D. Morris, Agua Caliente, Cal.

Cornish Games—The finest of table fowls. A few choice birds left at reasonable price. C. G. Wright, Kerman, Cal.

Barred Rocks—Only a few fine breeding cockerels for $3.00 each. G. L. Hawley, Madera, Cal.

Eggs for Hatching. R. I. Red $1.50 setting, 15 eggs. Free range. J. F. Mason, Route 1, Box 112, Watsonville, Cal.

LIVE STOCK

Ohio Improved Chester White (O. I. C.)—Entire herd immunized against hog cholera. Nothing but immunized stock sent out. Extra fine lot of fall pigs, both sexes, ready for shipment during February and March. Three herd boars used. All stock crated and registered. Make reservations now. C. B. Cunningham, Mills, Sacramento Co., Cal.

Blue Ribbon Herd Duroc-Jersey Hogs—Bred Gilts a specialty, 15 bred now, 20 ready to breed. Sires and dams win all blue ribbons 1912, 1913, 1914 State fairs. 15 firsts, 13 seconds, 6 thirds, 7 fourths, 1 fifth. Will show 1915. For prices, write Jno. P. Daggs, Modesto, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state All ages for sale. A. B. Humphrey, proprietor. Mayhews, Sacramento Co., California.

For Sale—Registered. Berkshires:. 25 choice pigs of best breeding from the best strains in America. For prices and description address H. L. Murphy, Perkins, Sacramento Co., Cal.

For Sale—Young registered Berkshire boars and sows; fine, strong stock. Boars ready for service. Stanislaus Ranch Co., Crows Landing, California.

For Sale—Pure Bred Hampshire Boar pigs $25.00 each. Ben F. Thorpe, Bonsall, Cal.

For Sale—Thoroughbred Duroc Jersey boars and sows. Strong and vigorous stock. Fred Hart, Exeter.

One Holstein Bull—Born January 10, 1915, $25. Riccomi Bros., Mountain View, Cal.

Registered Toggenburg buck kids, a few from choice stock at a bargain. H. W. Shepard, National City, Cal.

Glenview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

For Sale—Full-blooded, French Percheron stallion. L. E. Stockton, Ramona, Cal.

M. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

WANTED

Wanted—Responsible representative in each county. New Combination. 12 tools in 1. Sells at sight to farmers, teamsters, contractors, etc. Weight 24 pounds. Lifts 3 tons, hoists, stretches wire, pulls posts. Many other uses. Free sample to active agents. Easy work. Big profits. One agent's profit $45.50 in one day. Another $1000 in Dec., 1914. We start you. Write today for Big Color Plate. Quick action secures exclusive sale. Harrah Mfg. Co., Box M, Bloomfield, Ind.

Farms Wanted—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property free. American Investment Association, 12 Palace building, Minneapolis, Minn.

Wanted—To hear from owners of good fruit ranch or irrigated land well adapted for fruit ranch. Send price, terms, legal description. O. O. Mattson, 923 Andrus Bldg., Minneapolis, Minn., Dept D.

Wanted—Man to establish dairy on my alfalfa ranch near Corona. Must have some money or a bunch of cows. Herbert F. Clark, 31 N. Granada Ave., Alhambra, Cal.

For Sale—One thousand fine stocky San Jose Mayette Walnut trees, four to eight feet. Price reasonable. Address Chas. Story, Rivera, Cal.

Wanted—To hear from owner of good farm for sale. Send cash price and description. D. F. Bush, Minneapolis, Minn.

Wanted—To hear from owner of good farm or unimproved land for sale. C. C. Buckingham, Houston, Texas.

Tree Grafters wanted for walnut nursery work. Write or apply immediately to Tribble Nurseries, Elk Grove, Cal.

Wanted—A few pure Duroc Jersey pigs, bred or ready to breed. State price crated. W. R. Faries, Coachella, Cal.

MISCELLANEOUS

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

Ranchers—Now is the time to act. Get ready for this season canning up your entire crop of fruit and vegetables, getting from two or three times more cash for your entire crop and save it all by using one of our machines. We have the experience and trade on the canned goods. Write or call and see us for full particulars. Demonstrating plant, 223 E. 9th St., Los Angeles. Canners' Supply & Brokerage Co.

First Class Business Property—On one of the main streets. Small grocery store and large, up-to-date bungalow facing it; 2 smaller houses on side street, all rented for $50.00 per month. Want improved ranch up to $7000 or vacant land and cash. Want good land that will stand investigation as well as mine. Frauds need not apply; am on to them. Owner, 3030 East 1st st., Los Angeles, Cal.

OPPORTUNITY FOR DAIRYMAN
Wanted to lease—$75 a month to a Dairyman having cows, a fully equipped stone, dairy building, with large dairy barn, 40 acres of wet pasture and a good residence. Plant located at Victorville, Cal., where there is no dairy and where 1000 pounds of butter are used monthly. For further particulars apply Rancho Verde Co., Victorville, Cal.

For Lease at Floral Park, Ventura, California, eight acres of land and lath house, 100 by 200 ft. Rent $150.00 per year. M. J. Callahan, 1808 Jones St., St. Joseph, Mo.

For Lease—1200 acres good valley farming land, at $1.50 per acre, for a term of one or more years. Information concerning same write to F. J. Ethererry, Ramona P. O., San Diego Co., Cal.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

Housewives—E. Z. Y. cleans and polishes everything. Sample 10c. Full size 50c. Blauvelt Crittenden, 1033 Coronado Terrace, Los Angeles, Cal.

Indian Corn Silage—200 tons for sale. Heavily eared corn. Box 24, Butte City, Cal.

SEEDS AND PLANTS

New Varieties of berries originated by Alfred Mitting. New Dewberry White Fawn, the berry is white, large, fine, sweet flavor, $1.00 each. New blackberry Black Prince, a prolific bearer, berry 1½ inches long, quite tart, fine shipper, $1.00 each. New strawberry Santa Cruz, a rich, large, berry, dark red inside and out, fine flavor and shipper, 6 for $1.00. Send orders to Santa Cruz Bulb & Plant Co., 8 New St., Santa Cruz, Cal.

For Sale—Non-irrigated, San Fernando Valley Grown Seeds. Black Seeded Chilean and Angeleno Melon, 80c per lb.; Improved Hybrid, Golden Beauty and Pineapple Casaba, $1.50 per lb. First class seeds direct from the grower. M. C. Sutton, Van Nuys, Cal.

Rhubarb Plants—Now ready. Burbank's Crimson Winter, 75c per dozen. Wagner's Improved Giant Crimson Winter, $1.50 per dozen. Quantity prices on application. "Do it now!" Reginald Bland, San Luis Rey, San Diego County, Cal.

Sudan Grass Seed in fifty-cent packages. One package plants seventy-five acres next planting. Enough to plant six acres for five dollars. Jones County Seed Co., Anson, Texas.

50,000 Winningstadt Cabbage Plants—$2.15 per 1000. Get our seed price list. West Coast (Cut Rate) Seed House, 116-118 E. 7th St., Los Angeles.

For Sale—Tepary Beans, hand-picked; suits interior valleys; immediate delivery; F. O. B. 10c per pound, 50 pounds up less. Carl Nelson, Lindsay, Cal.

Berry Plants, Rhubarb, Cacti—It will be worth your while to send me a postal right now if you are interested. Louis F. Scribner, P. 2, Pasadena, Cal.

Rhubarb—Crimson Winter, $3.00 per hundred; Wagner's Giant, $5.00 per hundred. Good, strong, one-year plants. Currier Bulb Co., Seabright, Cal.

Feterita Corn Seed—The corn that puts the Du in Duroc, the Po in Poland, the Ber in Berkshire Hogs. For sale by John P. Daggs, Modesto, Cal.

Attention Dairymen—Plant Sorghum for green feed or ensilage. Seed for sale in lots to suit. A. L. Sayre, Madera, Cal.

For Sale—Sour orange seed, 75c per quart prepaid, by mail, or $15.00 per bu. F. O. B. J. M. Chaffee, Enterprise, Fla.

Rice Seed for Sale—Free of grass or other seeds. Write Jesse Peter, Pond, Kern County, Cal.

TURKEYS

For Sale—Turkeys; White Holland, Bourbon Red, Mammoth Black and the new Blue (slate); hardy, early maturing, popular varieties; in separate wire-covered yards, range alternately; eggs, $5 per dozen; stock, $5 to $12; won 13 prizes from 13 entries, Los Angeles show, 1915; 9 firsts; first male in all four varieties. Mrs. B. Hocking, Guasti, Cal.

Mammoth White Holland Turkeys—A few fine toms for sale. Also eggs in season from two very select pens. Orders given prompt attention. Prices on application. Address H. McKusick, Box 733, Calexico, Imperial County, Cal.

Mammoth Bronze Turkeys. Largest and best flock in the world. On account of the large number on hand will make special prices. Geo. A. Smith, Corcoran, Cal.

BEES

For Sale—150 to 200 Colonies of Bees for sale in first-class condition. In single story 2 hives, strong and well bred Italian stock; many of them about ready to swarm. Price $5.00 per colony. Apply Box M, Cultivator Office.

Beekeeping Pays Big—Price list, bees, instruction books, etc., free. Spencer Apiaries Co., Box 14, Nordhoff, Cal.

FARM LANDS FOR SALE

VICTORIA, AUSTRALIA, WANTS SETTLERS
Special inducements; government land, railways, free schools; cheap irrigation; 31 years to pay for farms adapted to alfalfa, corn, grains, fruit, etc.; climate like California; ample markets; reduced passages; special excursion being arranged. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

Apricot Land Bargain—300 acres ideal apricot land near Watsonville in tracts of 20 acres or more, at $100 per acre; easy terms; adjoining lands in full bearing orchards have netted annually $200 an acre for past six years. Get full particulars from Farm & Forest Realty Co., Watsonville, Cal.

C. M. Wooster Co.—25-year experts in land and mortgages; investers will save money and avoid errors by consulting them; land in all counties. 303 Phelan Bldg., San Francisco.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—23 acres well improved orchard, grapes and alfalfa; good pumping plant. For information write Mrs. L. Hurni, R. F. D. 1, Box 1, Linden, Cal.

For Sale—Orange, olive, peach and rice land. Close in, on good terms. Fred Hart, Exeter.

MOTORCYCLES

Order Your Motorcycle accessories and motorcycle parts direct by parcel post and save money, as we carry a complete stock, spring tandems, tires of all makes, lamps in all sizes, horns, and everything pertaining to motorcycle accessories, we have it. Also a fine selection of used motorcycles, consisting of the following makes: Excelsior, Indian, Thor, Harley and many other makes. We pay the freight on any motorcycle you buy from us. Write for a price list. Fred H. Bente, mgr. Excelsior Agency, 1550 Market St., San Francisco, Cal.

SCHOOLS AND COLLEGES

Telegraphy — Stenography, bookkeeping, English branches. Positions guaranteed. Mackay Business College, Los Angeles.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

RABBITS

Caldwell's Royal Red New Zealands scored and sold on merit. Catalog free. Caldwell Bros., Box 613R, Los Angeles.

DOGS

Registered Airedales—Young and grown stock, hunting or show type. $20.00 and up. Tunitas Kennels, 959 Phelan Bldg., San Francisco, Cal.

Insure Your Crops
By inoculating your seeds. Crops of Alfalfa, Clover, Peas, Beans, Corn, Wheat, Potatoes and all Leguminous crops greatly increased by the use of **Legumogerm.** Makes poor soil rich, rich soil richer. **PRICE POSTPAID: one acre, $1.50; three acres, $3.50; five acres, $5.00; ten acres, $8.00; twenty acres, $15.00; fifty acres, $35.00.** Full directions with every package. Special discounts to Seedsmen and Agents. Cuts furnished for catalogues. Send for circular A, **"Soil Improvement."** **WESTERN LEGUMOGERM CO., Topeka, Kansas.**

"VERTICAL FARMING"

We have received a copy of the book, "Vertical Farming," by Gilbert Ellis Bailey, Professor of Geology, University Southern California. Dr. Bailey believes the time has come for the farmer to extend his study and effort to greater depths in the soil than are reached by the usual agicultural implements, and he sustains his point of view with arguments showing the latent fertility of the subsoil and its capacity for storing moisture, once it has been disturbed, to a depth of five or six feet by the use of explosives.

The increase in use of subsoil plows, deep tillage machinery and the explosives for breaking up resistant and impervious subsoil, indicates that many progressive farmers will agree with Dr. Bailey's opinion, and now that the price of all food crops is so high, farmers in general are interested in any means for increasing crop productions. The book is distributed without charge and is certainly well worth sending for.

SOME PICNIC

The employees of the Nicholls-Loomis Company, large hay and grain buyers of Los Angeles, held their annual family picnic on Washington's Birthday in Santa Monica Canyon. Seventy employees of the firm, with their families, were present. Nine of the firm's automobiles and large motor trucks were used to transport those attending. Football and other games added to the pleasure of the afternoon, the principal football game being pulled off between the salesmen and office force against the teamsters.

By the way, it may be in order to refer to the business of this large concern. During the past year of depression it has been more than 100 cars in excess of any previous year's business.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Canning Olives

Will pickled ripe olives keep indefinitely by heating and bottling the same as fruit? If not, please advise how to keep them without having to change the brine?—Subscriber.

In the Cultivator of September 24, 1914, we give reprint of an article by Mrs. Sherman on pickeling and canning of olives.

Planting Walnuts

Kindly inform me if a soil five to six feet deep, underlaid with hardpan from one to six feet deep, would be all right to grow English walnuts successfully. The soil is first class.—Subscriber, Ceres.

There is always considerable risk in planting trees of any kind on land underlaid with hardpan. If one could always control the water supply and could be sure no more water would get on the soil than would keep it in a good moist condition, the trees would do well in five feet of good soil. If because of heavy rains or from seepage from adjacent land the soil should receive more than this amount of water there would likely be very serious damage to the trees. Walnuts are particularly susceptible to an excess of water in the soil when the excess is caused by improper drainage, and standing water either in the soil or on the soil will kill the trees within a few weeks.—J. B. N.

Repressing Growth of Apple Trees

Please tell me how to keep apple trees from growing straight up in the air like canes.—Subscriber, Escanto.

If the subscriber refers to young trees just being planted in orchard from the nursery would suggest they be cut back to 16 to 20 inches when set. Then as they start we would watch the young growth, encouraging at least three main branches, properly distributed around the trunk. Other branches we would surpress by thumb pruning, that is, pinching out the tender growth at the tip, then as the tree or four main branches get up to give liberal leaf surface to support the tree we would pinch the terminal bud so as to make them grow somewhat stockier, or at least we would pinch out any branches which showed excessive growth. Of the four branches two or three might be growing indifferently while others were taking all the sap. This should be repressed by thumb pruning during the coming summer. If orchard trees are watched during the first summer's growth they can be forced into better form than if allowed to run riot without any control.

Gophers

Mr. W. A. Randall of Azusa informs us of his observations regarding the use of sulphur mixed in soil around the trunks of trees. He has seen the dirt raked away from the tree and a cup of sulphur thrown around it with the result that gophers have given it a wide berth. We have never heard of this treatment before and it is perhaps worth experimenting with. In the meantime keep the trap in good working order.

Cauliflower Going to Seed

We had some trouble last year with cauliflower plants going to seed instead of making fine large heads. What is the remedy?—Subscriber.

The only remedy for this is the selection of better seed.

Use Nitrogen on Alfalfa

Answering a question as to the nitrogen fixing power of alfalfa and how to secure best results with it, Prof. C. B. Lipman of the University of California writes:

"If any nitrogen fertilizer at all is applied to alfalfa I should certainly give the preference to nitrate of soda. In most cases, if alfalfa is well inoculated, no nitrogen fertilizer is necessary. It has been repeatedly found, however, that a very soluble nitrogen fertilizer such as nitrate of soda, when applied in small quantities as a top dressing on alfalfa when making its first spring growth, or particularly when it is first making a stand, always results in a thriftier plant and one which appears to fix more nitrogen. I have but very little experimental data on that point and the statements above made are based merely on practical field observations. None the less, I should not hesitate under the circumstances above described to recommend the application of a top dressing of nitrate of soda to the extent of 50 to 75 pounds to the acre for alfalfa, and I have no doubt that improvement can thus be obtained. With reference to the use of gypsum on alfalfa land I want to say, as I have always maintained, that it has a limited use. either at the time of planting alfalfa to the extent of about 400 pounds to the acre for the purpose of setting free insoluble plant foods and encouraging the nodule forming bacteria, or for use on old alfalfa fields which have grown bald and patchy. In such cases an application of gypsum in approximately the quantity named together with thorough disking at the time of the year when the alfalfa is most dormant will always result in improved growth.

"As to lime I see no use in applying lime to alfalfa land unless the reaction of the soil is neutral or acid, and particularly the latter. In such cases it is best to apply the lime prior to planting the alfalfa at the rate of at least two tons to the acre of pulverized lime rock, or air slacked lime which is very much the same material. I should give the latter preference, however, because it is more likely to be in a finer state of division and also less resistant to solution by the carbonated water of the soil."

Olive Pomace as Fertilizer

We have inquiry as to the value of olive pomace for applying to orchard lands. We believe it would have great value as a humus former and it contains considerable ash and nitrogen. We will endeavor to get its analysis from a nitrogen, potash, phosphoric acid standpoint. As a feeding proposition, we have the following from the American Olive Company:

"We give below analysis of olive pomace after extraction of all oil: Water, 15.7 per cent; fat, .9 per cent; protein, 7.8 per cent; fiber, 47.8 per cent; ash, 4.2 per cent; free nitrogen and extractive matter, 23.6 per cent. Total, 100 per cent.

Poisoning Woodpeckers

I built an expensive bungalow on my ranch last fall, expecting to occupy it about May. In the meantime there is no one about. I find that woodpeckers have drilled four or five

Little Stories of Success

No. 4

C. B. Driver of Dinuba, has 350 acres of valley land, 220 acres of which are in bearing vineyard. He bought one of the first Baby Caterpillars made. "Yes," said Mr. Driver, "the engine sure does good work, especially in plowing. We use four plows and a harrow, plowing six to eight inches deep and sometimes ten. We take care of about 15 acres a day, working 9 hours." In the winter Mr. Driver uses the Baby to haul manure and does other odd jobs, like moving a house. He figures the Baby will do his work about 20% cheaper than horses or mules, even allowing for a sinking fund of 20% each year. As a matter of fact he has spent only $45.00 for repairs in the last two years.

Mr. Driver's success is being repeated by other owners who know how well the Baby is suited to work on small farms. We'll gladly give you the name of the one nearest you.

CALIFORNIA BUNGALOWS AND HOMES

The Greatest Bungalow Book Ever Published

The latest ideas in Bungalows! Half-tone photos, floor plans and Interior Details. Your money back if not satisfied. Send 50c coin or stamps to

THORPE ENGRAVING CO.,
Chamber of Commerce Bldg., Los Angeles, Cal.

large holes through the gables and sides into the attic. I have placed strychnine in raisins, grains, meat, water, etc., and placed in the attic but the birds do not touch the poison. There are nearly a dozen of the birds flying in and out. Can you tell me some way to get rid of them?—Subscriber, Los Angeles.

As the range of poisons seems to have been pretty well tried would suggest the use of fine wire netting tacked over the gable end of the house. A trap made of netting could probably be arranged so as to catch them but this would require personal attention.

Smut on Field Corn

I want to treat some field corn seed to prevent smut. I have bluestone on hand. Will you kindly tell me how to use it?—Subscriber, Vorden.

Seed treatment is said to be practically of no value in preventing corn smut, which costs this country above $20,000,000 annually. Perhaps the best means of prevention is burning every infected plant as soon as it is discovered and growing corn on clean fields. If infected plants are used as bedding and the manure carried to the corn field the infection of the growing corn is almost instantaneous.

Painting Tree Wounds

I notice in your issue of January 28 an inquiry from Subscriber, Oakland, in regard to a healing paint or wax for trees when large branches have been removed in pruning. I have had considerable experience along this line and about the best thing I ever tried is porch floor paint ready mixed. It always dries hard and forms a complete protection. It is quite expensive though if there is much surface to cover. Have also found that one-half gallon of crude oil and ten pounds asphaltum melted together makes a good covering that will not crack nor peel and it is very cheap.—E. O. Giddings, Porterville.

Another subscriber from Hollywood writes:

"In your questions and answers department of January 28th issue, under 'Dressing of Wounds,' you state that lead and oil is good if the oil is not permitted to come in contact with the bark of the tree. I am interested in knowing what harm will be done if it does come in contact with the bark, and how one can prevent it. In covering wounds on my trees with white lead and raw linseed oil I noticed that very often a dark stain, as if the oil had run into the bark, appears around the part painted. Is this doing damage?"

"Dark stain" aptly expresses the injury done to the work. This is sometimes killed or so injured that the stain deepens and new healthy wood will grow over it ultimately. The only preventive where paint is used is to apply in very limited quantity, covering only the actual cut surface and using the same care one would in painting ordinary woodwork where other portions of the wood are not to be covered.

Discouraging Ground Squirrels

A subscriber, Mr. C. A. Nidever of Paso Robles, sends the following hint for handling ground squirrels:

"I have had trouble in the summer and fall to get squirrels to eat poisoned grain. They would clean up all the grain scattered around the holes but seemed to store it instead of eating it. I tried the gas method of killing them but without much success as the ground was dry and let too much gas escape. Then I tried the following which got nine squirrels out of ten: Put about a teaspoon of poisoned wheat down the hole, stuff the hole with a sheet or two of old newspaper and cover it with dirt. Nine out of ten will never dig out and other squirrels moving in will dig down to the paper and then stop.

"The squirrels don't like the rattle of the paper and those on the inside will eat the poisoned wheat as soon as they get hungry rather than try to dig the paper out. Of course the paper alone won't stop them but delays them until they get hungry enough to eat the first thing at hand. This is slower than merely scattering the grain but pays in the result."

Poisonous Range Plants

Regarding the interest which has been aroused by reference to locoed horses in a recent Cultivator, Mr. Nidever of Paso Robles writes that he has secured much information from a brief circular regarding the principal poisonous plants of the western stock ranges just issued by the bureau of plant industry of the United States department of agriculture. The circular gives recognizable pictures of death camas, lupine, loco weed, two forms of larkspur, and water hemlock or wild parsnip; and the essential facts in regard to their characteristics are pointed out. The purpose of the circular is to call the attention of stockmen in a definite way to the plants which it is most necessary to avoid. Application for copies should be made to the bureau of plant industry, Washington, D. C.

Not Suitable Here

Are liatris and physostegia (perennials) also pennisetum (ornamental grass) suited to the California climate? Will they thrive here?—Gardener, El Monte.

All species of pennisetum seem to do well in California and some of them are very popular both North and South. Liatris flowers in the cooler days of autumn, about chrysanthemum time, and this suggests cool treatment. Therefore they should have partial shade and plenty of water. They have seldom found favor in Southern California, though given many trials.

Physostegia requires still more shade and water and a rich soil. In its native habitat it is found at its best in low, damp meadows subject to spring overflow, where a rich annual deposit is left. These cool fields,

THE AUTO-OILED AERMOTOR WITH DUPLICATE GEARS RUNNING IN OIL

Every bearing is constantly flooded with oil. The gear case, in which the duplicate gears run, holds two or three times as much oil as is required by the mill for a year of constant running, days, nights and Sundays. From the gear case the oil flows through every bearing in a continual stream. It goes out through the thrust washers in the hub of the wheel and is automatically returned to be used over and over again. No oil is wasted. This mill needs oiling but once a year. **Two quarts of oil in the gear case of the 8-foot Auto-oiled Aermotor will keep the gears and every bearing flooded with oil for a year or more.**

The galvanized helmet covers the gears, keeps out rain, keeps out dust, keeps in oil. The old Aermotor was known the world over as "the windmill which runs when all others stand still." This new Aermotor with gears and bearings flooded with oil runs in much less wind than the old Aermotor.

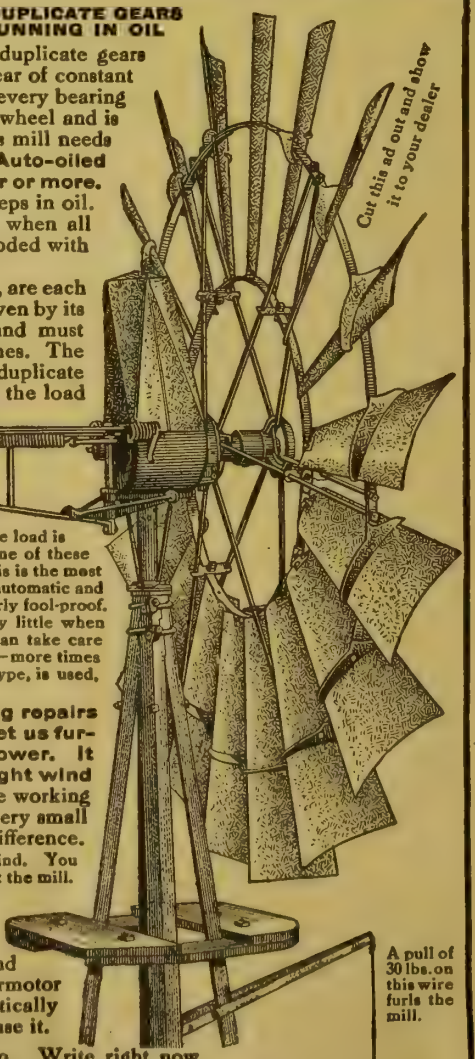
The two large gears, which lift the load straight up, are each independent of the other and each is driven by its own pinion on the main shaft and must take its half of the load at all times. The Auto-oiled Aermotor, with its duplicate gears and two pitmen lifting the load straight up, is unbreakable.

Every 8-foot mill is tested under a pumping load of 3000 pounds on the pump rod. For the larger sizes the load is proportionately greater. We know that every one of these windmills is unbreakable. We venture the assertion that this is the most nearly perfect, best made, best tested, best oiled, most nearly perpetual, automatic and self-sufficient of any machine of any kind ever made for farm work and the most nearly fool-proof. There is no friction on any part of the furling device when the mill is running and very little when the wheel is furled. A small child can easily furl this windmill or an automatic regulator can take care of it. One of these mills has been furled 10,000 times in one day by a man on our premises—more times than it would ordinarily be furled in 30 years of service. A band brake, of the automobile type, is used, and it always holds.

If you are tired of climbing a windmill tower; if you are tired of buying repairs and having them put on; or, if you are tired of waiting for a big wind, let us furnish you an unbreakable, self-oiling, ever-going mill to go on any old tower. It costs but little and you will get the difference between no water in a light wind and an abundance of water in almost no wind. The flooding of all the working parts with oil, the perfect balance of the wheel and vane on the tower, the very small turntable on which the mill pivots and the outside furling device make this difference.

Now there is no objection to a high tower. Have as high a tower as you need to get wind. You don't have to climb it. Your dealer can come once a year and put in oil, if needed, and inspect the mill.

Why not have flowing water, cool in summer and warm in winter, always fresh and pure? It will cost next to nothing. It will give health to your family and stock. Let the water run into a good size reservoir and raise all the fish of the choice kinds your family can eat, and have water to irrigate your garden and make it raise many times as much as it would otherwise. The Auto-oiled Aermotor makes all this possible as it can run from one year's end to another with practically no wear and no cost. Water costs nothing. Use it. To let it stand is to abuse it.



If interested, write **Aermotor Co.,** 1146 So. Campbell Avenue, Chicago. Write right now.

shaded by few or many trees, have a climate we cannot duplicate, for our nights are too cool and days too dry. These flowers are not recommended for local use.—E. B.

Salpiglossis Seeds

Can salpiglossis seed be sown directly in the ground or should they be started in flats and transplanted later to permanent bed? Do they need rich ground and will they do well on the east side of the house where they get sun until about 2 p. m.?—Gardener, El Monte.

Early sown seeds should be in boxes but at this season they are best sown where they are to grow. The reason of this is that if once checked in growth the plants do not entirely recover and will make tall spindly plants, whereas seeds sown in the permanent bed will make vigorous, bushy, large-flowering plants. They are not exacting as to soil, being closely related to petunias, and, like the latter prefer sunshine. They will do well in an east bed.—E. B.

Tuberculosis-Aspergillosis

Cock and several pullets have died. Usually they go lame, seem stupid, but eat heartily. On examination find spots on liver, sometimes full of hard white lumps, also in intestines. They have plenty of range, good water, some vegetables, green barley, lettuce, alfalfa and Swiss chard. They have excellent care and proper hen houses. —Subscriber, Orange.

There are two diseases that are characterized by these yellowish nodules in the liver and intestines. One is tuberculosis; the other is aspergillosis. Aspergillosis is caused by mold spores from moldy feed or scratching litter, which find their way into the respiratory and digestive tracts and grow there. It is usually indicated by a rattling in the throat and later by diarrhoea, weakness, drowsiness, roughness of plumage and sometimes emaciation and lameness. In tuberculosis there is almost always emaciation ("going light"), pale comb and a ravenous appetite. There is often lameness and sometimes ulcerous swelling of the joints. It is impossible to diagnose tuberculosis accurately without a bacterial examination of the lumps in the liver, but the death of the cock and pullets certainly suggests it. On the other hand, the fact that the pullets had red combs and were normally fat is against it. I should look first in the feed and litter for mold and make sure that everything about the house was as clean as it should be. In the second place I should remove from the flock every bird that seemed ill in the least, and as soon as I was sure of the symptoms I would kill every one and burn their carcasses. Unless you find reason to believe that the trouble is caused by mold, it would be a good plan to remove the whole flock to fresh ground, for tuberculosis bacilli are spread through the droppings, and if any of the sick birds did have tuberculosis the soil where they have been is more or less contaminated. As long as the pullets seem healthy there can be no reason why their eggs should not be used for food.—J. A. K.

Rheumatism

Tom turkey nine months old is unable to stand. He eats and seems well otherwise. Is it rheumatism? This trouble came on at the time of the rain. He has freedom of the ranch and has lived out in the trees at night. Only being fed wheat in the evening.—Subscriber, Acton.

It is hard to say without seeing the bird whether he has leg weakness or rheumatism, but I should certainly make him sleep under a roof till the rains are over. Turkeys can stand a good deal of wetting, but once in a while they suffer from it. If the legs seem stiff or swollen rub them with some good liniment. If there seems to be only weakness, try to persuade him to exercise a little. Rubbing the legs with olive oil might help to strengthen them. If the trouble came on suddenly after a heavy rain I should be inclined to suspect rheumatism. His heavy weight would hardly weaken his legs so that he could not stand without some preliminary symptoms of weakness. The chief treatment for either leg weakness or rheumatism is removal of the cause. If exposure is to blame, shelter should give relief. If he has been eating too heavily and exercising too little, a ration consisting mainly of green feed, with very little grain, will help to tone up his system. Green feed is also one of the best remedies for rheumatism. The following preparation of elder bark is also recommended: Scrape the outer skin from a quantity of the bark and put in a glass fruit jar all it will hold. Cover this with apple vinegar and add (for a quart jar) a piece of alum half as large as a walnut and the same amount of copperas. After this has stood a short time, add enough of the liquid to the drinking water to give it a pleasant acid taste.—J. A. K.

Late Moulting

Out of a flock of 15 hens three began to moult about January first. What is the cause of such late moulting?—Subscriber, Los Angeles.

Had your hens molted once before in the early fall or summer, or is this their only molt? Sometimes an extra good layer keeps on laying right through the fall and postpones molting till winter. I had one such case, a hen in her second year that laid steadily till about Christmas, then became most disgracefully ragged just when all the other hens were out in their new costumes. It is said that the older the hen is, the more likely is she to molt late and the less time will she spend in molting. Sometimes unusual heat or heavy feeding induce a second molt in hens that have already molted. I have heard that it is not uncommon for Leghorns in our warm climate to molt twice, but I have never seen an Orpington do it. Sometimes hens and pullets will molt late without any apparent reason. This winter all my Buttercups, both yearling hens and March pullets, went into the molt the first of December, while Orpingtons in the same house, of the same age and kept under identical conditions, did not drop a feather. This proves to my mind that we really know very little of the reasons why a hen molts when she does. If your hens have laid all the fall without molting, I think you may safely mark them as in all likelihood among your best layers.—J. A. K.

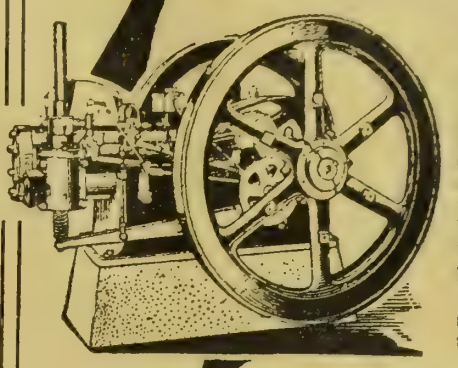
Horse Beans Grow In Winter

Touching upon an answer to a query in a former Cultivator as to the growing of horse beans, Mr. C. K. Meyer of Tuolumne writes:

In answer to a question about horse beans you state that they will not stand frost and advise planting in April or May. They would do no good planted at that time, but should be planted in the fall after the first rain, or if one has water to irrigate, it would be best to plant about the first of October. They will stand frost and even hard freezing. I have grown them here for several years at an altitude of 2500 feet where the winters are much colder than at Merced. They are grown in the coast and bay counties as a winter crop. Horse beans do best in cool weather. They are not related to the ordinary bean but resemble the pea in bloom and

STEADY AND QUIET ECONOMICAL OF FUEL

Western Gas Engines consuming special gas oil at 2½c per gallon, cost one third of a cent per HP. per hour to operate.



All our years of engine building experience are concentrated in the new model WESTERN GAS ENGINES. We have left out every unnecessary part. Wearing parts could not be made better. We have built long life and supreme satisfaction to engine users in every WESTERN GAS ENGINE we are turning out. Compare these engines point for point with any on the market, then decide for yourself. We build them every part alike and standardized, on the very finest automatic machinery, with the highest class of skilled labor, under the supervision of master mechanics. WESTERN GAS ENGINES are built in one of the finest equipped factories in the country by master engine builders. The many orders we are now receiving proves that the WESTERN GAS ENGINE is the ideally all-round, all-purpose engine for ranch work.

Before you buy an engine send for our catalogue—free to all who write for a copy.

CAMERON IRRIGATION PUMPS

For the continuous and exacting work in irrigation pumping, you want pumps that are simple and dependable with the least attention.

CAMERON CENTRIFUGALS have been designed and built with the special aim of producing a combination of high working value and low operating cost. Simple and strong all through. Finest material and workmanship. Highest efficiency. Backed by an experience of over fifty years. Can be operated by motor, gas engine or belt. Put your pumping problem up to us. No obligation.

If You Want the Best Nursery Stock to be Had at Lowest Prices Obtainable

Send me a list of your "wants" for my special quotations.

I will save you money and you will obtain the best results.

Ten Dollars worth of Fruit Trees for $5

Known as my "Model Home Orchard" consisting of 29 varieties of fruit, ripening early to late. This collection is made up of the best varieties in my nurseries, as follows:

4 Peach trees, popular sorts.
4 Apple trees, for home use.
1 Crab Apple tree, large variety.
4 Plum trees, selected kinds.
3 Pear trees, early to late.
2 Apricot trees, table varieties.
2 Cherry trees, standard kinds.
1 Nectarine tree, best red.
1 Quince tree, best for preserving.
1 Soft Shell Almond tree.
6 Grape Vines, assorted.
No two fruit varieties alike.

I make the above offer in order to further introduce my high grade nursery stock. Send in your order; you'll be highly pleased.

foliage. In Mr. Igali's article in the Cultivator he makes the same mistake when he states that lentils are not hardy. I received lentils, chick peas and vetch, several varieties of each, several years ago from the University of California experiment station and grew them in a small way for several years and all are entirely hardy here.

Fertilizer for Potatoes

Will you please tell through the columns of your valuable paper the kind of fertilizer used by Northern and New England potato growers? Also the best that can be used on sandy soil to give good results?—G. A. C., Anaheim.

We are not informed as to particular brand of fertilizer but doubt not it is simply a brand which is rich in potash. Any fertilizer maker who understands that a fertilizer is to be used for a crop of potatoes will understand that one rich in potash is necessary.

Leaf Spot of Strawberries

Please tell me what is the matter with my strawberries. They seem to be dying. I enclose some of the leaves.—A. B. J., Escondido.

This was referred to Prof. H. S. Fawcett of the pathological laboratory at Whittier. He writes:

"The specimens of strawberry leaves from Escondido appear to be affected with a fungous leaf spot, sphaerella fragariae. The continued moist weather has probably favored the disease. The fungus is said to germinate only when there is considerable dew or moisture on the leaves. It is also said that plants growing upon heavy, wet, undrained soil suffer more than those on drier soil. I find also in looking up the literature on this disease, that some varieties are much more resistant than others.

"The remedy given for this disease is cutting, gathering and burning of the tops after harvest. The use of Bordeaux mixture after the removal of the diseased leaves, is said to lessen the infection of the next year. In Florida Hume found that three early sprayings with a 5-5-50 Bordeaux mixture checked the disease completely. These remedies are for Eastern conditions, but they would probably be helpful here."

Corn and Blackbirds

Do you know of a corn equally as good as Egyptian that is not bothered by the blackbirds?—B. E. R., Lodi.

We do not know of any variety of Egyptian corn or milo maze which will not be damaged by birds. There is a white seeded, black hulled kafir corn which is not as attractive to birds as the light colored varieties. Sometimes the planting can be done so as to have the crop mature while the birds are away, as most of the damage is done during the week or ten days when the corn is in the milky condition.—J. B. N.

Rabbits With Canker

I have been troubled with a disease among my rabbits which causes a sort of yellowish scab in the ears and seems to make the rabbits nervous. Is there a remedy and if so, what is it?—Subscriber, Los Angeles.

Your rabbits are suffering from that disagreeable disease known as canker of the ear, which is frequently found even in some of the best kept rabbit warrens. This disease is not only very contagious but can be carried through generations of breeding, if any of the parent stock or ancestors have been subject to this disease. Would advise that all specimens so affected be destroyed immediately, as they are worthless for breeders. A cure may be effected by rubbing well into the abscess or parts affected, equal parts of sulphur and pure hog lard, mixed well together. The cause of this disease is unknown.—R. V. M.

Tresspassing Sheep

Have the sheep men any right to pasture unfenced land without renting it, or what must I do to have a legal case against them?

There is no law in California which will prevent sheep from feeding on land which is not fenced; that is, no law other than the estray law. The stock may be taken up and impounded, but as to damages, our law specifies that none may be collected unless the lands are surrounded by a substantial fence.

Olive Cuttings

What variety of olives do you recommend? Would you prefer budded cuttings? Soil is side hill, hardpan land, well drained, in warmest belt of Tulare County.

Where cuttings are used no budding is necessary. In a sense the cutting is a bud and, of course, should reproduce true to the parent tree. Skill and experience are demanded in choosing cutting from the right kind of a tree. Know the productiveness and the quality of the fruit for years, then trust to your cuttings to give you a desirable tree. Side hill soil anywhere with hardpan may be all right for olives; it depends entirely upon the depth of the soil and as to whether the hardpan is so arranged as to give fair drainage. As to variety, we think selected Missions would be best.

Horse Beans

My horse beans, planted last October, have made a fine growth and are full of blossoms. Will they mature a crop? If so, when? Blossoms seem to blight. Or is it only the summer grown that come to maturity? Kindly advise at earliest possible opportunity, as my neighbors plow under in February in order to have the bean stalks decay for limas or other crop in May. But if I could be assured of maturing my horse beans I would not bother with another crop.—J. L. S., Santa Ana.

This crop will mature all right; beans will begin to form as soon as we get a few warm, clear days; it is the cloudy, cold weather that is causing blooms to blight. Green beans should be ready to pick early in March, but the mature beans will not be dry until June or July. We would not advise saving the dry beans, as the weevil gets into them very badly here.—D. F. R.

Employe's Abstinence

Please tell me why business men demand total abstinence on the part of their employes?—M. E., Exeter.

The above is not exactly agricultural and the inference is not entirely correct. That is, all employers do not demand total abstinence. With railways and many large institutions which have the safety and even the lives of the public in their hands there are often restrictions to the extent of requiring total abstinence on the part of employes, this for the obvious reason that clear heads are demanded for the work in hand.

Spraying Tree Tops

I have noticed reference to spraying trees with nitrate of soda when dormant, this to stimulate and induce buds to set stronger crops. Would it be advisable to add the nitrate of soda to lime sulphur or blue vitriol sprays? If so please give formula.—Subscriber. Gardena.

The formula for the nitrate of soda spray for tree tops is 50 pounds nitrate of soda, seven pounds of caustic potash and 50 gallons water. This is perhaps the best time of year to apply this wash which has proved beneficial in some cases though its ultimate worth has not yet been proved out. It is, however, worth a thorough trial on the part of orchardists. We would mix with the other wash referred to. However, that again is worthy of a trial.

The Household Department

BACK HOME

I'd like to take a week's-end off
And get back to the farm,
With griddle cakes and sausages
And other things that charm.

I'd like to tumble in a bed
Of feathers soft and warm—
Secure beneath the old roof-tree
From trouble, fret or storm.

I'd like to hear my mother's voice
Come up the entry hall:
"It's six o'clock, you sleepy head!
And this is my last call."

I'd like to hear the dishes clip
Together down below,
Where she fixed up the breakfast things
Helped by Melinda Snow.

I'd like to rustle up the hair
Of my dog, Towser, now—
The best friend that a boy e'er had,
So close to me, somehow.

Through all the days that come and go,
No matter where I roam,
I'd like to hear his welcome bark
When I go drifting home.

I'd like to take a week's-end off—
And so would you; once more
Go back to lift the latch again
Upon the dear old door.

There snuggle close up to the folks
In pleasant firelight;
There hear the mother-voice again
Give you her fond "Good-night."—
New York Times.

CHARLIE'S AUCTION

Uncle Eph tipped back in his chair and put on his best story-telling expression. "Yes," he drawled, "thar seems to be a lot o' folks in the world that claim the milk of human kindness has all turned sour. You meet 'em every turn in the road. They're not exactly cheerful lookin'. The lines in their faces all turn down. They seem to take a sort o' satisfaction, tho, in their belief that everybody is jest waitin' fer a good chanst to get the best o' everybody else. They can usually give you some convincin' illustrations from their own experience too. Mostly always that's what started them thinkin' everything and everybody has gone to the dogs or are on the way.

"Funny, ain't it, what a little world we live in? It's bounded on the north by 'I,' on the east by 'me' and the rest of the way by 'myself.' So, if a man does me before I get a chanst to do him it's sure proof to me that the world's a howlin' wilderness where every man's hand 's against his brother and the other hand 's got a big club in it.

"It's folks o' that sort that I like to tell about Charlie's auction. I told it to young Dr. Burns one day. He's been tryin' to build up a practice here an' it seems to be mighty like the kind o' buildin' we used to do with A, B, C blocks when we was children, just about the time he'd git it up to a respectable height some of the other doctors would come along and push it all over. His patients helped out some too. The day I told him the story he had been tellin' me his latest affliction. 'Twas bad." Uncle Eph shook his head and took a firmer grip on his old cob pipe. "The man was one o' these 'ere about-to-strike-it-rich sort. He always had some new and brilliant scheme for spendin' other folks money. He was a real convincin' talker. He could take a mustard seed an' make it grow to a big manufacterin' plant before your very eyes. That's the way he got the doctor.

"You see, the doctor saved his baby's life; had a mighty hard pull of it, too. Lost some good payin' patients when the little fellow was at his worst and the doctor couldn't leave him. Well, the father seemed to be grateful enough, allus perfessed to be achin' to do somethin' fer the doctor. Finally he got up a scheme fer puttin' up hossradish an' mustard, fancy, fer the hotel trade. He figgered it out so it looked like a chanst to be a Rockefeller sure enough. Doc he jest handed over about $500 to launch the thing an' didn't ask a scratch o' the pen fer it, he was so sure the man was givin' him this chanst out o' gratitude.

"About three weeks afterward he went out there one day to see how things was gittin' along, and found the house empty an' nobody could tell where the folks was gone. Well, he found they had gone in the night an' left a lot o' debts behind 'em so he knew that kind o' gratitude wasn't wuth much in cold cash.

"Course all that made the doctor feel pretty sore. He sure did say some strong things about folks in general. Said he'd never believe anything anybody said agin', an' when he hear'ed himself talk he'd look in the glass.

"He relieved his feelin's about human nature until he run out o' mean names an' then he begun on the Almighty. I stopped him short there." Uncle Eph's clenched fist came down on the counter with an emphatic thug. "I told him," he went on, "that the Lord probably knew more about folk's meanness than he did, but it wasn't the Lord's fault they was so bad cause He made 'em decent in the first place an' fixed things so they could go on livin' that way. It was jest man's wantin' his own way, an' grabbin' everything in sight fer himself that made all the trouble.

"I didn't quote Scripter at him, tho there was some about 'a fool an' his money' 'riz up in my mind. Scripter is mighty fine medicine fer some folks, but I didn't think his system was prepared fer it jest then, so I told him about Charlie's auction.

"Now Charlie was a fine chap, best one o' the hull Hall tribe, but he never could gether up much uv anything cause he was too good natured and had too many relatives. The Joneses and the Hawkinses and the Cranes and the Halls wuz all related, an' Charlie wuz at the beck an' call uv the hull crowd. They used his team an' broke his harness an' fergot to fix it; they borrowed money uv him an' paid it back when they got good an' ready, if they paid at all; they dropped in on him by the dozens fer Sunday dinner an' on Thanksgivin's, an' circus days, so Charlie never had no use fer a bank book, an' could hardly keep feed enough ahead to take his stock thru the winter.

"Well, there wuz one year Charlie had a specially hard time. The river come up an' licked up his corn, hadn't a stalk left; one uv his best horses got mixed up with a barbed wire fence so bad it had to be killed an' he had to pay a hundred an' fifty dollar note he'd endorsed fer Jed Hawkins.

"Misfortunes like poor relations allus come visitin' in bunches, so to

STEVENS

THE KILLING RANGE OF THE STEVENS

If you want the best made, smoothest-working and safest 12-guage Repeating Shotgun your choice will be the STEVENS No. 520. Hammerless, solid breech, recoil unlock. Furnished in all barrel lengths, and tested for smokeless or black powder. Weight about 7¾ pounds.

List price of either No. 200 20-Gauge or No. 520 12-Gauge, $25.00, but either is sold by retail dealers for $21.60, except west of Mississippi River and in Canada.

These guns are made of the very best materials by skilled workmen, and offer more value for the money than can be obtained elsewhere. They are not to be compared to the old style hammer guns.

20-Gauge Hammerless Repeating Shotgun No. 200 is as great as of any 12-gauge gun, and both gun and ammunition are lighter to carry. Suitable for wild fowl, birds, and small game, or for trap shooting. It weighs only 6½ pounds but handles shells up to 3 inches in length, heaviest factory loads, smokeless or black powder, 20-gauge proportions throughout — not a mixture of 20 and 12-gauge parts. All barrel lengths.

Just as strong a shooter as larger gauge guns

top it all Charlie's wife got sick. She wuzn't sick in bed, jest kind o' pindlin, but all the bitters an' tonics an' stuff the relatives could think uv didn't seem to help her any an' when she begun to cough an' hev red spots in her cheeks every day, Charlie got scared an' tuk her to the doctor.

"'Twas old Doc Kelly he tuk her to. He'd knowed her an' Charlie ever since they wuz little codgers an' he sure did hate it, but he had to tell Charlie she had consumption, an had it so bad he couldn't do anything fer her but the only chanst o' savin' her wuz to git her to the mountains as quick as it could be done.

"Poor Charlie. It wuz bad enough to know that Nellie wuz in sich a fix, but when there wuz a chanst o' savin' her an' he didn't hev enough cash to pay her fare to the place Doc said she ought to go to—well, they said Charlie looked like a drowndin' man at the last gasp.

"He braced up some before he went back to Nellie. The doctor thought it wouldn't be best to let her know how bad off she wuz, so Charlie jest told her Dr. Kelly thought she wuz pretty much run down an' needed a change o' climate. Nellie laughed an' asked if he wanted her to go to Europe, an' Charlie said 'No, not quite so fur as that,' an' then she lowed they might go an' visit her maw's folks in the next county. She joked about it all the way home, Charlie keepin' up his end on it all well as a man could when his heart wuz well nigh broke, but he didn't sleep any that night, ner fer a good many nights afterwards.

"'Twas a mighty bad time to hev a sale. The floods hed done lots o' damage in the valley an' then a drought come on top o' that an' folks wuz a feelin' mighty blue. He didn't hev time to advertise it much so 'twant much uv a crowd that come, even countin' the wimmin' an' chillern. 'Twas a gloomy sort o' day too, an' everybody seemed to hev a sort uv funeral feelin'.

"The auctioneer got up an' made his little spiel. Got off some brand new jokes to sort o' liven things up, but a sickly sort o' grin wuz all the encouragement he got.

"Well, he put up Charlie's old sorrel fust; wust beast he had, savin' the best o' the stock till he'd got things kind o' warmed up, an' hopin' more folks would come too, I guess. That sorrel wuz a mighty sorry lookin' nag. Looked like she'd bin left in the rain an' the color hed soaked off in spots. 'Charlie won't get much out o' that poor beast," I says to myself, when they led her out, but I bid fifteen dollars jest to start things goin'.

"John Goodell wuz standin' not fur from me an' he hollered out 'Twenty-five.' Don't know what it wuz. Guess 'twas his tone o' vice, kind a darin' like. Anyway my fightin' blood riz an' I yelled back 'Thirty-five!' He sung out 'Forty,' an' then we had it nip an' tuck. We forgot all about the old hoss, leastwise I know I did. Couldn't see nothin' but that mean, tantalizin' 'I'll-beat-ye-yet' look on John's face, an' we stood an' throwed sums o' money in each other's faces like we wuz millionaires. Finally I see Jeff Walker come up an' sort o' grab John by the arm. John stopped biddin' then an' the hoss wuz knocked down to me at seventy-five dollars.

"I come to, about then. I could see that hoss all at once, real plain. I could see my good, hard-earned money too, that I'd jest the same as throwed down in the dust cause that there hoss wuz wuth jest about thirty dollars, an' a tight squeeze at that. Well, course, like any other human, havin' made a fool uv myself I looked around fer somebody to lay the blame on to, an' jest then I remembered that nudge I see Jeff Walker give John Goodell. Maybe I wuzn't mad. Them two had put up a trick on me, I could see it plain as day. I started fer Jeff, snarlin' like a buzz saw. I jest intended to scatter him all over the landscape, but before I could git my hands on him Jim Goodell an' Sim Horn stepped in between us an' John says in a low sort o' commandin' tone 'See here, don't you be a fool an' spoil everything. You jest wait 'till this is over an' we'll tell you somethin' that'll make you feel different.'

"I stopped pushin' at 'em an' cooled down a bit, then I thot about that seventy-five dollars an' I fired up again. Guess John must o' read my mind fer he said, low, so nobody could hear him, 'You won't hev to pay no more'n that hoss is worth. You jest shut up an' go back where you was so folks won't notice an' after they git thru here I'll explain an' fix things up with ye. Here's my hand on't.' I see he meant it an' did what he told me, but I sure was some mystified by sich doin's.

"They was sellin' the cows when I begun to take notice again, an' I'll be blamed if they didn't every one on 'em go fur at least twenty dollars more than they was wuth. The hogs all went at fancy prices, too an' the chickens, you'd a thought they was game birds by the amount o' money they fetched.

"Even the furniture sold like it was new, an' Charlie's kids hed kicked off varnish and pulled off knobs, an' handles an' trimmin's, till it fairly hollered fer the repair shop.

"D'ye know," Uncle Eph reached over slowly and appropriated a soda cracker from the display box standing on a vinegar keg near the counter. He munched in silence for a few moments and then took up his story once more. "As I wuz sayin'," he resumed, " I got to feelin' sort o' creepy over the looks o' things. Men I knowed wuz mighty close wuz biddin' in things at figgers that ud make a good spender nervous. I begun to git pretty anxious fer that little confab with John Goodell fer I hed a suspicion he cud tell me what it all meant.

"Well, they sold everything finally, an' as soon as folks begun to git their stuff together to go home I hunted up John Goodell an' says, 'Now I'd like to hear what you hev to say.'

"' Well,' he says, 'it was jest this way—a lot uv us knowed that Charlie wuz right up against it, and we wanted to help him out but we knowed it would nearly kill him to give him money right out—make him feel he was a dead failure an' all that, when everybody knows 'taint Charlie's fault, so we got together an' schemed this-a-way. I tuk the valley, an' Jeff he went back on the hills, an' Sam Allen he went over White Crick way, an' we told all uv 'em Charli's fix an' told them as wanted to help him out to come to the sale an' raise the price o' anything they bid on jest as fur as they cud afford to, but if 'twas something small they wuz to be careful not to raise too high, or Charlie might suspicion somethin'.'

"' We made every man uv 'em swar they'd never tell it, now or hereafter, but I thot I ought to let you on to it fer I sort o' lost my head an' carried you in too deep with that poor old sorrel. Jeff Hawkins nudged me when I wuz biddin' so heavy fur he wuz afeared we'd give the hull thing away, an' he nowed you wuzn't on to the game fer we didn't think you'd come so fur. We hed it all made up tho that if a man got in too deep we'd help him out o' the general fund, so thar's about forty dollars comin' to you I low.'

"' No sich thing,' I snapped out, 'I guess I know a good investment when I see it. Nellie's a mighty good girl an' I couldn't ask fer any better chanst than to help Charlie save her life.'

"'Oh, if you look at it that-a-way,' said John, clappin' me on the shoulder, 'we won't say a word, only keep mum.'

"When they counted up the money they found they'd got four hundred dollars over an' above what Charlie thot the stuff would bring as sales generally go. They went to the mountains the next week. Charlie got a place on a big ranch before they'd bin there a month, an' Nellie got well an' strong, an' now Charlie's away from that tribe that was always pullin' on him. He's doin' fine—got a place uv his own most paid fur."

Unconscious of the storekeeper's anxious glance, Uncle Eph helped himself to a handful of crackers in his exultation over Charlie's good fortune.

"What did the doctor say to all that?" I ventured.

Uncle Eph chuckled. "Oh, he just hunched up his shoulders a little an' said, 'That's a very pretty story, but I guess a lot o' well-to-do farmers could afford to amuse themselves that way if they felt so inclined.' My! but I was riled, just wanted to take my cane an' beat the meanness out o' him, but performances o' that kind is pretty expensive these days an' don't do much good either, so I jest helt my breath an' the mad in fer a minit er

"The Badge of Power"

COMMERCIAL ENGINES

Best Built Engines In The West

For every need, on every occasion, you will find throughout the State of California a majority of "Commercial Engines" working silently, powerfully, day after day, year in and year out, at a wonderfully low cost of operation. Their efficiency and perfect service makes them the standard by which all other engines should be judged.

Write at once for our catalogue 18-C and any information you may desire on the subject "Power On the Farm."

Commercial Engine Co.
2416-32 Porter Street, Los Angeles
Branch 1228 "H" St., Fresno, Cal.

ONE FIRST COST THEN NO MORE

That's what it means to pump water with the world's strongest windmill, the long-lived, double geared, powerful

SAMSON

"Let the wind pump your water for nothing"

STOVER MFG. CO.
178 Samson Ave., Freeport, Ill.
Also Stover and Ideal Feedmills—Alfalfa Comminuters and Grinders—Pump Jacks—Ensilage Cutters. *Send for Catalogues.*

STEAM PRESSURE CANNING OUTFITS

Can your Fruits, Vegetables, Corn, Meats, Fish, etc., for home use and for sale at a big profit. Outfit more than pays for itself the first year. 11 different sizes. Book of Canning Recipes free with outfit. Tells how to can everything. Write for Catalogue B.

Built by

Henninger & Ayes Mfg. Co.
47 First Street PORTLAND ORE.

APOLLO ROOFING

Fireproof, weatherproof, clean, reasonable in cost, durable—specially adapted for construction of farm buildings. Sold by weight by leading dealers. APOLLO ROOFING is made from the well known APOLLO BEST BLOOM Galvanized Sheets. These sheets are also unexcelled for Silos, Tanks, Culverts, Cisterns and forms of exposed sheet metal work. You should use no other. Send for "Better Buildings" book.

AMERICAN SHEET AND TIN PLATE COMPANY,
General Offices: Frick Bldg., Pittsburgh, Pa.

Ladies, Make Your Own Skirts

The Efficiency Skirt Cutting System includes a patented appliance that makes it the most perfect skirt cutting system in the world, and so simple that a child can use it. It pays for itself with one using. Write for particulars.

The Efficiency Co.,
209 Black Bldg. Los Angeles, Cal.

two an' then I looked squar at him an' I sed:

"'See hyer young man, you got eye trouble mighty bad; you ought to git it fixed er it'll bring you a lot o' sufferin'. You've got a squint,' I says, 'an' a man with a squint don't see but jest part uv a thing an' you seem to get your vision fixed on the dark side o' things an' miss the light entirely. Now,' I went on, 'the reel facts is, them men, every one on 'em had to dig like beavers fur every cent they got an' that little splurge down to Charlie's cost 'em a heap more'n the money they paid out.'

"'Jeff Walker gave the money he'd saved up to buy a ridin' plow 'count o' him gettin' his leg hurt last winter, an' he hed to limp along jest like always all thru the plowin' season.'

"'The Horns give the price uv a second-hand buggy they'd meant to buy an' bumped to town an' church in their old farm wagon' Widow Jones put in a new washin' machine an' she sure needed one, pore weak little creature. It cost 'em all, good an' plenty,' I told him, an' then I sed a little rhyme to him I'd read somewhere—can't jest recall now—but it's somethin' about the world bein' mighty hard to beat, 'You get a thorn with every rose, but ain't the roses sweet?'

"Doc kinda sobered up. 'Guess maybe you're right about that squint, Uncle,' he said, 'but I can tell you this much, if ever I find a bunch o' folks like that I'll settle right down an' stay with 'em if I live to be a hundred. They'd sure make a man feel like life was wuth livin.'

"Then he jumped up quick an' sort o' laughed an' said, 'Good-bye Uncle Eph, if preachin's over I guess I'll go see an occulist,' an' do you know, it wasn't 'till next day I figgered out that 'occulist' meant 'eye doctor.'"

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Oranges
Cereal Cream
Spider Corn Cake Bacon
Coffee

Lunch or Supper

Tuna Cakes Cream Scones
Lettuce Salad, Mayonnaise
Indian Pudding Tea

Dinner

Beef Stew with Dumplings
Baked Potatoes Creamed Tomatoes
Pickled Mangoes
Lemon Souffle Brownies
Coffee

Cream Scones

Two cups flour, four teaspoons baking powder, two teaspoons sugar, one-half teaspoon salt, four tablespoons butter, two eggs, one-third cup cream. Mix and sift together flour, baking powder, sugar and salt. Rub in butter with tips of fingers; add eggs well beaten (reserving a small amount of unbeaten white) and cream. Toss on a floured board, pat and roll to three-quarters inch in thickness. Cut in squares, brush with reserved white of egg, sprinkle with sugar, and bake in hot oven fifteen minutes.

Tuna Cakes

Pare and boil three medium sized potatoes, mash, seasoning with butter, pepper and salt, then beat in one-half can tuna picked to pieces. Make into cakes, roll in egg and bread-crumbs and fry a nice brown.

Lemon Souffle

Yolks four eggs, grated rind and juice one lemon, one cup sugar, whites four eggs. Beat yolks until thick and lemon colored, add sugar gradually and continue beating, then add lemon rind and juice. Cut and fold in whites of eggs beaten until dry; turn into buttered pudding dish, set in pan of hot water and bake 35 to 40 minutes. Serve.

Brownies

One-third cup butter, one-third cup powdered sugar, one-third cup Porto Rico molasses, one egg, well beaten, seven-eighths cup flour, 1 cup pecan meats, cut in pieces. Mix ingredients in order given. Bake in shallow fancy cake tins, garnishing top of each cake with one-half pecan.

Use level measurements.

Made of **Resisto Veal**, the new leather that withstands the alkali of the soil and ammonia of the barn yard.

Mayer

HONORBILT WORK SHOES

Stand the hardest kind of wear but are not heavy or clumsy. Resisto uppers, double stitched heavy oak tanned soles—solid counters—double leather toes—the greatest leather combination put into work shoes.

WARNING—Always look for the Mayer name and trade mark on the sole. If your dealer cannot supply you, write to us.

MILWAUKEE Mayer CUSTOM MADE HONORBILT

We make Mayer Honorbilt Shoes in all styles for men, women, children; *Drysox*, wet weather shoes; *Yerma Cushion Shoes, Martha Washington Comfort Shoes.*

Alfalfa Seed

Every field where Seed we offer for sale was grown in 1914 was thoroughly inspected by us for dodder, noxious weeds, etc., before it was harvested.

Everything we offer has been government tested to make our assurance doubly sure, both as to germination and foul weeds.

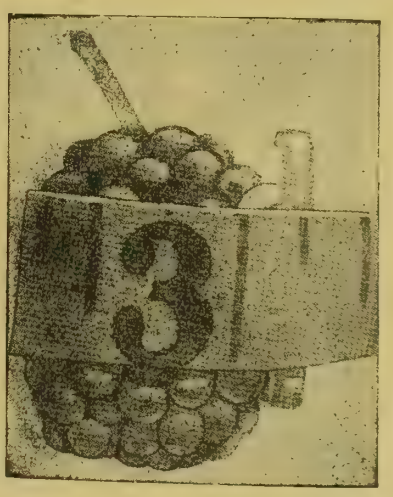
We are actually offering California's best product.

If you are looking for cheap, unreliable stuff, you will have to look elsewhere, but if you want good seed at an honest price we can serve you.

Samples, prices, etc., on application.

V. A. Peterson Alfalfa Seed Co., Arbuckle, Cal.

The only exclusive Alfalfa Seed Dealers in the West.



Try this New Blackberry At Our Expense

TO CULTIVATOR SUBSCRIBERS ONLY—To have this New Macatawa Everbearing Blackberry tested in as many localities as possible, claiming it to be the sweetest and best table berry on the Coast, the propagators of this berry have made us a proposition for supplying same in shipments of 6 plants each by parcel post, all charges paid.

Their description of the Macatawa is as follows: "It is a cross between the true Giant Himalaya and the Eldorado. The fruit is very large and sweet, in fact, it is the sweetest blackberry grown. It is coreless and almost seedless; very solid, jet black when ripe and can be shipped 1000 miles without bruising. The shape is oblong, very uniform, averaging three and one-half inches around one way by three and one-fourth inches the other way. The bloom is almost semi-double, about the size of a silver dollar. So far all who have tested this berry say it is the sweetest and best flavored berry they ever tried."

DO YOU WANT SIX OF THESE PLANTS? If so send in the regular subscription price for one year's subscription to the Cultivator, new or renewal; add 25c to cover cost to the nursery of postage and packing, and the six plants will be carefully packed and mailed you promptly without additional charge.

REMEMBER—The regular price of the 6 plants alone is $1.00 postpaid. Only one shipment will be made to a customer, but subscriptions and plants may be sent to different addresses.

HAY

Under date of February 27, Scott, Magner & Miller say:

Receipts of hay for the past week were 2206 tons, the preceding week, 3250 tons. There is every outlook for a large crop of hay, especially in sections where it has been impossible to put crops in up to this time owing to the heavy rains, and in many of these sections it is now too late to sow grain with the expectation of a crop; hence, much of this land will volunteer, which as a rule, makes a very fine quality of feed hay.

Fancy red oat hay seems to be the most sought after commodity and is extremely scarce. Fair grades of red oat hay are plentiful. Alfalfa is offering freely. Straw is nominal.

Citrus Fruit Market

LOS ANGELES, March 2, 1915.

When asked as to orange marketing conditions, a shrewd observer simply remarked, "It's rotten," and he added: "That means both fruit and market." Continued rains, some wind, bruising the fruit, and the general softening conditions, are causing serious decay. This is causing suspicion on the part of the trade. There is nothing strange in this; it is almost invariably the case at this time of the year. This year's condition is somewhat aggravated by wind and rain, but the month of March, or about blossoming time, always brings loss. Icing has begun in the effort to lower the percentage of decay. Last year icing began two weeks earlier than this. In fact, the prices being received now, compared to last year, are favorable. It is presumed that blossoming period over, fruit will again ship in better condition.

There is no change in the lemon market, and the lemon growers generally consider holding up fruit the best policy.

Shipments—

Shipments of oranges from Southern California to date since November 1, 1914, 8579 cars; lemons, 1128; total, 9707. To same date last season, oranges, 8270; lemons, 564; total, 8834. From Tulare County: Oranges, 5089; lemons, 158; total, 5247. Last season to same date, oranges, 4470; lemons, 30; total, 4500. From Northern California this season: Oranges, 618; lemons, 1. To same date last season, oranges, 389; lemons, 5; total, 394. Total from the state this season: Oranges, 14286; lemons, 1287; total, 15,573. To same date last season, oranges, 13,127; lemons, 599; total, 13,726.

NEW YORK, March 1.—Thirty-five cars of navels, seven mixed, two cars lemons sold. Market about 10 to 15 cents lower on navels and lemons. Fair.

FARM BUREAUS

(Continued from Page 267)

phases of "Profitable Livestock Raising" at every meeting except the three scheduled for the Salt River Valley.

A. L. Enger, assistant engineer, University of Arizona agricultural experiment station, will discuss "Pumping Plant Problems" at Casa Grande and Summerland.

Dr. A. E. Vinson, biochemist, University of Arizona agricultural experiment station, will talk on "Soil Improvement" at the Crane District, Yuma, Somerton and Wellton.

At the Phoenix Roosevelt district, Lehi and Gilbert, James A. Armstrong, Maricopa County farm adviser, will speak on "What to Expect of the Farm Adviser," and Professor S. F. Morse will discuss "Ranch Profits."

The meetings in the Verde Valley and in Northern Arizona will be held by G. W. Barnes, farm adviser on live stock.

A. L. Paschall is farm adviser for Cochise and Santa Cruz Counties, with headquarters at San Simon, Cochise County.

James A. Armstrong has been appointed farm adviser for Maricopa County. His office is at Phoenix.

LEGAL QUERIES

(Continued from Page 275)

Bees

We are in a citrus fruit district. Our neighbor keeps bees in the hedgerow near our boundary line and they are a great nuisance flying around our water faucets and troughs and stinging our men and horses when we plow, cultivate or work near them. Is there any law or redress from such a nuisance?—Subscriber, Orange.

The keeping of bees in a locality where they are a source of annoyance to others may be a nuisance, and for such nuisance you would be entitled to bring action against the beekeeper to enjoin him from permitting his bees to stray upon your land and in such action would be entitled to collect damages which you may have suffered.

Ditch Abandoned

There is an old ditch running through my place which has not been used for two seasons, the owner having made a new one on another neighbor's land. The right-of-way for the old ditch was given with the understanding that when the use of the ditch stopped the land reverted to owner. How long does non-use determine the abandonment of a ditch? There are no papers showing right-of-way or the agreement.—Subscriber, Big Pine.

Abandonment is entirely a question of fact. If the intention to abandon the ditch of which you speak has been formed and once acted upon the abandonment is as absolute, if it exists for a moment, as though it continued for years. The fact that the old ditch has not been used for two seasons is a strong element backing an inference of abandonment.

Keeping Receipts

Every person has a growing accumulation of receipted bills, cancelled checks, etc., and the question of their disposition is an important one involving legal interpretation of the California outlaw statute. How short a time may receipted bills be safely kept in this state?—F. A. C., Los Angeles.

An action to recover a balance due upon a mutual, open and current account or upon an open book account does not outlaw for four years, so it would be entirely safe for a person to keep receipted bills for at least four years.

Community Property

If there are no children will one-half of community property go to husband's people should he die intestate? Would a deed secure wife?—Subscriber, Lathrop.

In case of community property upon the death of the husband one-half goes to the wife, and there being no issue, the wife takes one-half of the remaining one-half, making altogether three-fourths, leaving one-fourth to the relatives of the husband. The best and most secure method is that of a will duly executed, as the husband can will one-half of community property to the wife or whomsoever he desires.

Separate Property

Would property acquired through gift be given to the wife or would it go to husband's sister?—Subscriber, Glendora.

Property acquired through gift, bequest or devise is separate property, which upon the death of the husband is divided equally between the wife and the relatives of the husband, in case there are no children and no will.

Probate Will

What proceedings should a person take to have deed changed when husband has died leaving no will and wife has remarried? Have paid taxes on property for the last eight years. —Subscriber, Fresno.

If the property was in the name of the husband, in order to acquire title thereto, the estate of the husband must be probated.

FEDERATED ASSOCIATIONS

(Continued from Page 259)

Each of these is so busy with its own matters that it has little time to give to others working along similar lines. If this federation can be made a strong one it will find its mission.

Dr. Webber, who was really the first to suggest this more inclusive organization, had in mind another purpose, and that is a scientific one. It was that this might be a great state organization along lines similar to certain national, geographical and scientific societies. Those organizations have large memberships, with a nominal fee which pays for copies of proceedings which are of worldwide interest. We see nothing to prevent including both of these ideas in this new organization.

At the San Francisco meeting, State Horticultural Commissioner A. J. Cook called the meeting to order and stated the purpose of the meeting. Mr. Messenger, editor of the Cultivator, was named as chairman, and Prof. H. E. Van Norman of the Agricultural College was named as temporary secretary. Dr. Webber of Riverside outlined the value, scope and possibilities of such a proposed organization. The discussion was participated in by Messrs. Rowley, editor of the California Fruit News; Carver of the State Dairy Association; Gilstrap and Lynch of the State Beekeepers' Association; Hecke, McKevitt and Dunn of the Farmers' Protective League; Craig of the Outlook Association; Pres. Johnson of the Farmers' Union; Guilford of the Sacramento Valley Irrigation Company; Webber and Van Norman of the State University; Kimble of the State Sheep Breeders' Association, and Thorpe of the Walnut Growers' Association.

After an afternoon's discussion it was unanimously decided that such an organization was necessary for the best interests of the agriculture of the state. It was moved and carried that a committee of seven be appointed by the chairman to draft a brief, comprehensive constitution of federation, including a directorate, made up of one representative of each association, to define membership, to outline a plan of finance, and to fix a time for a meeting for action on the proposed plans. As soon as those appointed have accepted a place on this committee a meeting will be called, at which plans will be discussed and arrangements made for a general meeting of producers of the state, to be held in San Francisco within the next month or two.

VACANT LOT UTILITY

(Continued from Page 268)

Beans make a desirable crop and may be planted as late as the last of June provided the ground has been faithfully cultivated up to the time of planting.

Tomatoes are an excellent crop to grow on non-irrigated land where there has been 15 or more inches of rain and the moisture retained by properly working the soil. These should not be set out, except in frostless places, before April 1.

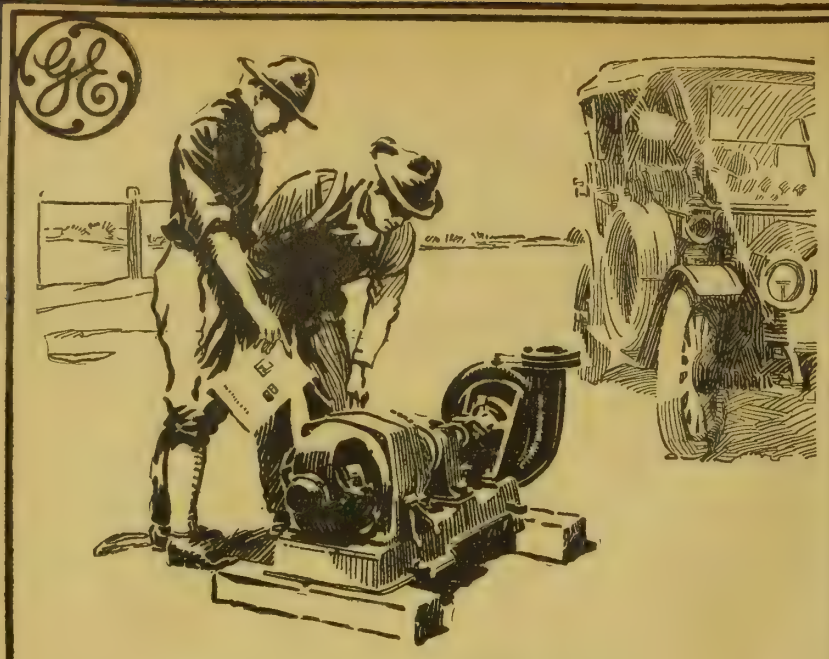
The principal thing in growing stuff on a vacant lot without water is to retain the natural moisture. This is done by keeping the top soil well pulverized by cultivation and destroying all weeds.

Fertilizers in concentrated form may be used but their full value will not be obtained unless there is considerable late rain to dissolve the ingredients and make them available for the plants.

ANOTHER APPARENT CHANGE

(Continued from Page 269)

does the influence of this remarkable parasite stop here, for the pistil is arrested at an early stage of its development and in certain other structural characters the flower closely approximates to that characteristic of a male plant—so closely indeed that very careful experiments were needed to clear up the matter."



Let a G-E Engineer Help You Save Money

When you buy a G-E Electric Motor, you get with it the expert services and advice of a competent engineer who represents the largest and most widely experienced electrical manufacturing company in the world. Any problem of economically using a regulated supply of water for your ranch is easily solved if you will let a G-E engineer and a G-E motor help you.

Hundreds of letters have been received from ranchmen, stockmen and farmers throughout the West praising

G-E ELECTRIC MOTORS
For RANCH AND FARM

Sturdy, dependable, no delicate valves or machinery to get out of order, they outlast the best engine.

—And there is real economy in a G-E motor. It will deliver power every hour in the day without attention and can be switched on and off, a mile away if necessary.

Write today for our illustrated booklets about ranching with electricity—they are free.

General Electric Company

Los Angeles Office:
124 West 4th Street

San Francisco Office:
Rialto Building

The General Electric Company will gladly answer all questions relating to the use of electric power for ranch and market garden irrigation.

Did Grandfather Dig Out His Water Pipes

every few years because they were rusted out and all the water was going to waste? No sir. You can't remember that he ever took them out at all.

They used *pure iron* in those days, not modern steel with its content of manganese, sulphur, copper and carbon.

ARMCO AMERICAN INGOT IRON CULVERTS

are made from iron in which the *total* of impurities is less than one-sixth of one per cent., and which is made even more carefully than was the pure and durable iron of our grandfathers' time. The tests of service in every State of the Union and in a dozen foreign countries have shown that they are

Tough, Reliable and Lasting

Insist on seeing the triangle brand on every section. It is your protection against the substitution of inferior metal.

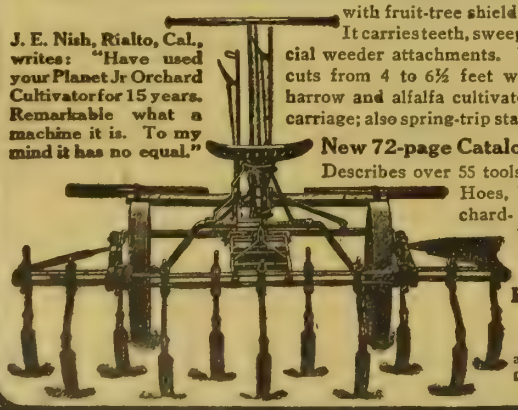
There is an Armco manufacturer in your vicinity. Write him or ARMCO CULVERT PUBLICITY BUREAU, CINCINNATI, OHIO

Planet Jr. Orchard Cultivator

For the fruit-grower who wants maximum profits this **No. 41 Planet Jr Orchard and Universal Cultivator** is an absolute necessity in the orchard, vineyard, or hopyard. Its strong, durable construction and lasting service make it the most economical orchard cultivator you can buy.

This No. 41 has strong, light frame, low wheels, and tongue, all of steel. Is equipped with fruit-tree shield and side-hitch for low trees. It carries teeth, sweeps, furrowers, plows, and special weeder attachments. Works deep or shallow, and cuts from 4 to 6½ feet wide. Convertible into disc-harrow and alfalfa cultivator. Can be fitted with fore-carriage; also spring-trip standards, and irrigation steels.

J. E. Nish, Rialto, Cal., writes: "Have used your Planet Jr Orchard Cultivator for 15 years. Remarkable what a machine it is. To my mind it has no equal."



New 72-page Catalog (168 illustrations) **free!** Describes over 55 tools, including Seeders, Wheel Hoes, Horse Hoes, Harrows, Orchard- and Beet-Cultivators. Write postal for it today.

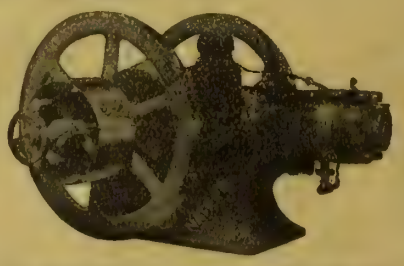
National Oil Engine

An engine which will burn fuel costing three cents per gallon, and at the same time is an engine with 90 per cent less parts, is the engine for the rancher to buy.



A LETTER FROM A USER OF THE NATIONAL OIL ENGINE

Kingsburg, Cal., Dec. 19, 1913.
National Steam Pump Co.,
Los Angeles, Cal.
Gentlemen:

I bought the first NATIONAL Oil Engine sold in this State. Any one wanting an engine let them come and see my 15 H. P. pulling a 6-in. centrifugal pump lifting thirty feet throwing two cubic feet moving one foot per second, using low grade fuel. I will answer any letter.

Truly yours,
(Signed) L. E. HURLEY.

We guarantee the saving in fuel expense and purchaser's own judgment will tell him that in doing away with 90 per cent of the small, delicate and complicated parts, springs, gears, etc., that he is getting away from engine trouble when he invests in a National. 1915 catalog now ready.

LOS ANGELES March 11, 1915 SAN FRANCISCO

Trestle of Rincon Causeway, Coast Route of State Highway

Low Center Of Gravity *with* Usual Road Clearance

Oakland

The Car of the Farm

From radiator to tail-light the Oakland is built to give the service the man in the country wants in his car.

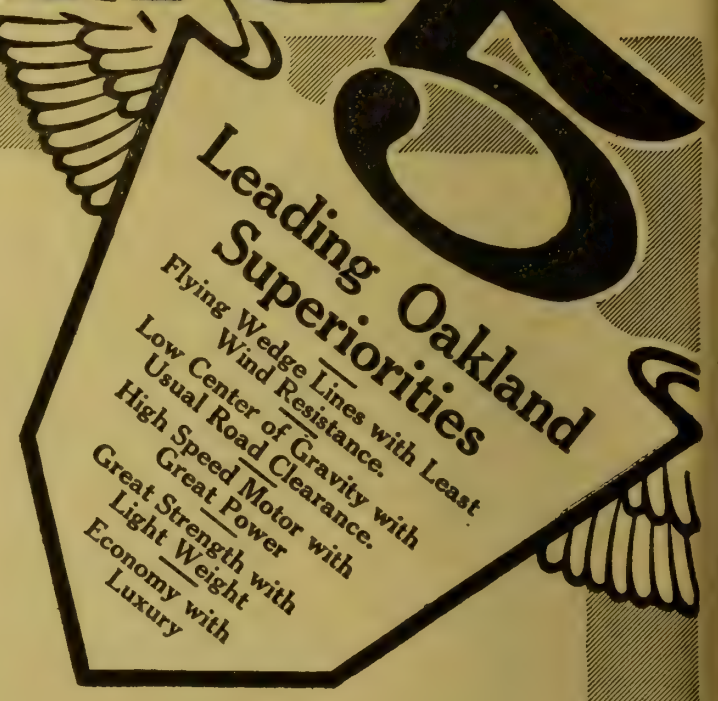
Get at the matter point by point as an expert would judge a show animal. The truth is that the real value in service of an automobile can be boiled down to five points.

The car that has these points will take you more miles at less cost than others, and it will do it for you with most comfort and satisfaction.

Study These Oakland Superiorities

You will find some of them in other makes, but only in the Oakland will you find them all. The low center of gravity with plenty of clearance means the elimination of sidesway and danger when driving on bad roads at high speed. The Flying Wedge Lines mean less wind resistance and added beauty.

The strength of construction means ability to stand the grind of the years. The perfectly balanced Oakland Northway motor that speeds up to 2500 revolutions with increasing power means steady and uninterrupted speed, together with unusual hill climbing ability. Special spring design and construction assure luxurious riding qualities.



Every point about this car works towards economy. Let our dealer give you a ride in the Oakland.

Proposed Legislation Affecting Agriculture

Synopses of Some of the Bills Before Our State Legislature. Furnished by San Francisco Chamber of Commerce.

FROM the great number of bills affecting agriculture now before our state legislature, we give digest of some of particular interest, as prepared by the San Francisco chamber of commerce.

Abbreviations—A.B., Assembly Bill; S. B., Senate Bill; A. C. A., Assembly Constitutional Amendment; S. C. A., Senate Constitutional Amendment.

A. B. 98, By Mr. Spengler—This is the Eight-Hour law defeated at the November election. It provides that no person shall be employed more than eight hours during one day of 24 hours or more than 48 hours in one week, in any manufacturing, mechanical or mercantile establishment, laundry, hotel, public lodging house, apartment house, hospital, place of amusement or restaurant or telegraph or telephone establishment or office in this state. The bill does not apply to the harvesting season, canning and curing or drying of any variety of perishable fruit or vegetables nor to graduate nurses in hospitals. The labor bureau is to enforce the provisions of the act.

A. B. 410, By Mr. Chenoweth—Provides that every horse-drawn vehicle and all vehicles propelled by muscular power while on the public highway shall from a half hour after sunset and a half hour before sunrise, carry a lighted lamp showing a white light, visible under normal conditions, at least 200 feet in front and carry a red light in the rear visible for a distance of 500 hundred feet.

A. B. 490, By Mr. Encell—Creates a department in natural resources with a secretary at a salary of $7500, and combines under his office the following commissions: State board of forestry and its members, the state forester, the California Redwood Park, state conservation, state fish and game commission and the state register of lands under the Carey land act.

The department shall be organized into three bureaus known as the bureau of forestry, the bureau of fish and game and the bureau of public lands. The head of each bureau shall be known as a director.

A. B. 491, By Mr. Encell—Creates the office of state forester at a salary of $3000 and he is authorized to appoint an assistant and deputy forester, the salaries of each not to exceed $1800 per year. He shall have charge of the fire wardens of the state; protection and improvement of state parks and forests; enforces all laws for the protection of forest, brush or grass land; enforces the fire laws to furnish assistance for protection from fire. Gives the forester authority to declare a public nuisance all forest areas containing inflammable debris, which by reason of location or lack of protection may endanger life or property.

A. B. 529, By Mr. Ream—Prohibits action for trespassing against owners of live stock whose stock may stray or run upon any unfenced private lands within the boundaries of any national forest of the state, if the owners of such live stock are holders of a grazing permit issued by the United States.

A. B. 603, By Mr. Gebhart—Makes it unlawful for any person to bring into the state any horses, mules, dairy cattle or breeding bulls unless the same are accompanied by a certificate of health and tuberculin test record signed by a qualified veterinarian. Animals accompanying shipment of immigrant movables are exempt.

A. B. 604, By Mr. Gebhart—Amends an act to protect domestic live stock from contagious diseases. Authorizes the governor to appoint an assistant state veterinarian at a salary of $3000 per year; adds a new section to be known as section six and one-half; invests the assistant state veterinarian and the deputies with all the powers and authority of the state vetinarian; repeals section 7 of the act; authorizes the state veterinarian to appoint a deputy veterinarian and a clerk; the deputy to receive $2400 per year and the clerk $1600. The state veterinarian is authorized to appoint additional deputies as necessary, whose salaries shall in no case exceed $200 per month each.

A. B. 621, By Mr. Harris—Declares all section lines running through any agricultural land in the state and the land on each side thereof for a distance of 20 feet public highway where the same shall be necessary to connect or accommodate farming neighborhoods. Any ten freeholders who will be accommodated by such road, five of whom must reside in the district may bring proceedings to demand the land required for such road. If the court shall determine such a road necessary it shall be the duty of the board of supervisors to pay the amount determined by such condemnation proceedings.

A. B. 694, By Mr. Quinn—Authorizes any county in the state to incur by purchase, condemnation or otherwise, land for public parks and to acquire indebtedness therefor. Upon petition of 25 per cent of the total registered voters of the county the supervisors shall call an election to vote on such park bond issue. Such bond issue shall require a two-thirds vote.

A. B. 716, By Rigdon—Appropriates $8,700 for the establishment and maintenance of 58 yearly scholarships of $150 each at the California Polytechnical School. These are to be apportioned one to each county. Failure of a county superintendent of schools to recommend a county before August 1 shall cause that county to forfeit its right to such scholarship.

A. B. 851, By Mr. Ashley—This is the Fruit Standardization bill—requires all packed fresh fruit to be packed in accordance with its specifications, except fruit sold in bulk without packing. Enumerates cherries, peaches, pears, plums and prunes, apricots, grapes and berries. Requires that all packed fruit shall be of uniform size, quality and maturity. Each box or container shall bear in plain figures the minimum weight of the contents. Grapes shall be well matured and show a sugar content of not less than 17 per cent. It is the duty of the county horticultural commissioner to enforce the act. Where there is no commissioner it shall be the duty of the supervisors to appoint inspectors on petition. The act goes into detail as to the size of the box, its shape and the manner of packing. Violations of the act are declared a misdemeanor punishable by a maximum fine of $50.

A. B. 868, By Mr. Sharkey—Creates a county highway department for each county. The county highway engineer in counties of the first class shall receive a salary of $5,000 per year; in counties from the fourth to the 25th class, $3,000 per year; from the 26th to the 36th class, $2,000 per year; from the 37th to the 50th class, $1,500. He is empowered to appoint and employ such assistants as he may need. He must make all surveys, maps, plans, specifications and estimates, inspect the work performed on highways, aqueducts and bridges. He shall have management of all county rock quarries, oil pits and depots, gravel pits and all other material.

A. B. 1283, By Mr. McDonald—Authorizes municipalities to declare noxious or dangerous weeds growing upon the streets or sidewalks or upon private property within municipalities to be public nuisance creating a lien upon the property fronting upon such streets or sidewalks for costs of abating the same.

A. B. 1304, By Mr. Hawson—Makes it unlawful to sell or offer for sale any box or package or carton containing raisins unless the same shall have marked conspicuously thereon the variety of grape from which the raisins were manufactured.

A. B. 1358, By Mr. Spengler—Enforces a one-day rest in seven for every person engaged in any occupation of labor except work essential to the relief of sickness, furnishing lodging or meals, ice cream parlors, museums or art galleries, sale and delivery of daily newspapers, the sale and delivery of milk or cream, and unavoidable work in dairy products, work essential to the production of mines and the continuous supply of electrical current, light, heat, air, water, gas or motive power operating vessels and transportation lines; to telegraph and telephone service and any work which the railroad commission deems necessary. The labor commissioner is authorized to enforce the act.

A. C. A. No. 1 By Mr. Cary—Proposes a new section to article 11 of the state constitution, to be numbered 14½, creating a fruit commission, consisting of three members to be appointed by the governor for four years. The legislature by a two-thirds vote shall have the power to remove the commissioners for dereliction of duty or corruption or incompetency. Their salaries shall be fixed by the legislature but the commission shall have the power to fix the salaries of assistant deputies and employes. The commission may fix or change standards of quality, of size, of color, of percentage of sugar and of package of all fruits, nuts and vegetables grown in the state. The commission has the power to inspect all fruits, nuts and vegetables, the packing thereof and may forbid the offering for sale or shipment of products not conforming to standards fixed. The bill provides for hearings filling vacancies.

A. C. A. No. 3, By Mr. Downing—Proposes a new section to article 1 of the constitution to be designated as Section 26. "To the end that citizens may obtain steady employment, the state shall engage in such work of internal improvement and shall establish, own and conduct such farms, factories, workshops and such other industries or means of employment as the legislature or the people may from time to time designate, and shall distribute, sell or supply the product or service of such industries to the people. The profits derived from all such enterprises shall be employed in the extension, betterment and maintenance thereof. The state may also buy or condemn any land within the state, may improve such land or any other land now owned or hereafter acquired by the state and lease the same or any part thereof to actual farmers on easy terms; but no land now owned or hereafter acquired shall ever be sold absolutely."

S. B. 93, By Mr. Stuckenbruck—For the establishment of county free markets. Provides that on the petition of 15 per cent of the qualified electors of a county board of supervisors and the mayor of any municipality, may establish a county free market in such municipality. A board of five directors of the market shall be appointed. The purpose of the free market is to

Citrus and Tropical Fruits

AVAILABLE PHOSPHORIC ACID

Written for California Cultivator
By Gordon Surr

BULLETIN No. 116, issued by the state agricultural experiment station at Pullman, Washington, is of great interest and value to all who use phosphorus for fertilizing. George A. Olson is the author, the title being "The Quantitative Determinations of Mono, Di and Tri Calcium Phosphates and Their Application."

The phosphoric acid in monocalcium phosphate is soluble in water, while that in dicalcium phosphate, or "reverted" phosphate is insoluble in water but is dissolved by ammonium citrate, the water-soluble and citrate-soluble phosphoric acid being commonly termed "available." These two compounds result, directly or indirectly, from the treatment of phosphates with sulphuric acid, for tricalcium or bone phosphate is the form in which phosphorus exists in untreated bones and in raw phosphate rock.

In the official method of anaylsis of superphosphates, etc., the phosphoric acid in dicalcium phosphate is estimated by treatment with an exactly neutral solution of ammonium citrate, of a certain specific gravity, acting for a certain length of time, at a certain temperature, with agitation at stated intervals. Of this method Mr. Olson truly says: "Just why ammonium citrate has been used to determine the amount of available phosphoric acid in fertilizers is difficult to understand. The action of this solvent certainly is not based upon any fundamental principle of chemistry, neither can it be said that the compounds of phosphoric acid soluble in ammonium citrate are forms of phosphoric acid available for the plants, since some of the iron and aluminum phosphates are soluble in this solvent and yet practically unavailable for plants.

"The method in use for determining available phosphoric acid is wholly empirical and for this reason alone will always prove to be unsatisfactory. An empirical method involves certain conditions of definite concentration, time, and temperature upon particles of the same chemical substance offering equal surfaces. Other things being equal, any variation in concentration, time or temperature will materially influence the results. Therefore, an empirical method will give unsatisfactory results in the hands of different operators, with different substances, and with different degrees of fineness of the substance."

Ammonium citrate also acts to some extent upon tricalcium phosphate, which fact was known as far back as 1882.

Mr. Olson goes on to show that the three forms of calcium phosphate can be differentiated and accurately determined by dissolving the material in nitric acid, adding an excess of ammonia and filtering. Two-thirds of the phosphoric acid of monocalcium phosphate will be present in the filtrate and one-third of the phosphoric acid of dicalcium phosphate, while there will be no phosphoric acid in the filtrate in the case of tricalcium phosphate.

The phosphorus in raw phosphate rock is usually considered to be present in tricalcium phosphate, and raw phosphate rock is, in most places, far cheaper than superphosphate as a source of phosphorus. Superphosphate, when used on soils containing carbonate of lime, soon reverts to dicalcium phosphate and then to tricalcium phosphate, while if soils are acid, the addition of superphosphate increases the acidity on account of the gypsum in the superphosphate. In making super, about a ton, roughly, of sulphuric acid is used to a ton of raw phosphate, consequently superphosphate contains a good deal of gypsum. Acid soils are undesirable for most crops, and the acidity should therefore be neutralized, preferably by lime carbonate in the form of ground limestone. Whether corbonate of lime was originally present in the soil or later added, the results on superphosphate are the same for, in either case, it will soon change to tricalcium phosphate.

In this connection Mr. Olson says: "Fertilizers made up of available phosphoric acid, whether in the presence of gypsum or not, tend to react when mixed with the soil to form compounds more difficultly soluble, such as tricalcium phosphate, and artificial fertilizers can not be considered, truly speaking, mono, or dicalcium phosphates, in the presence of gypsum, but rather sulphuric acid interchanging with phosphoric acid and calcium. In the final analysis, so far as the application of phosphate fertilizers to the soil is concerned, we should only regard them as tricalcium phosphate. The reaction of superphosphate and reverted phosphoric acid with alkali shows them to be tricalcium phosphate. Further, we know that tricalcium phosphate is available to the plants.

There is no need for modifying the tricalcium phosphate other than reducing it to suitable fineness to offer the largest possible surface to be acted upon by the soil and plant solvents in the soil. All chemical tests of phosphate fertilizers should be limited to the analysis of the total phosphoric acid and that which is not precipitated with alkali, such as ammonium hydroxide, and not how much is water or ammonium citrate soluble."

Mr. Olson concludes his remarkably interesting and valuable paper with the following significant paragraph: "In soil, mono and dicalcium phosphates tend to react, forming tricalcium phosphate. There is then nothing to be gained by applying either superphosphate or reverted phosphoric acid to soil." Comment is superfluous save to remark that the phosphoric acid in super usually costs about twice as much as the phosphoric acid in finely ground raw phosphate rock.

Certain crops require a good deal of sulphur, alfalfa for example, drawing more heavily upon sulphur than upon phosphorus, and doubtless in some cases where sulphur is deficient the good results following applications of superphosphate are due as much to the sulphuric acid in the superphosphate as to the phosphoric acid present. In these cases it is generally much cheaper to use gypsum or sulphuric acid independently, taking care that sufficient carbonate of lime is in the soil to prevent acidity. Raw phosphate rock always contains some lime carbonate.

Many so-called "complete" commercial fertilizers are much richer in phosphoric acid than is necessary, seeing that most crops draw far more heavily upon nitrogen and potash than upon phosphorus, and the intelligent will of course wholly disregard a formula which is purely conventional and adapted neither to the requirements of crops nor soils. Thousands of dollars are annually wasted in blindly buying fertilizers, but this is "another story" and can not be gone into here.

A SUCCESSFUL CAMPAIGN

The campaign against the soft gray scale, coccus citricola, which was conducted during the last season in Tulare County, closed some weeks ago excepting that some experimental work is still being done and the life habit of the insect is being more fully worked out. A year ago citrus growers of Tulare County were much more discouraged over this pest than they are today. The preceding season a little experimental work had been done in spraying and in fumigating the pest but it was not satisfactory. Early summer found growers with diverse sentiments as to best procedure. Several new suggestions of methods were offered which it was thought would control it. The preceding year's fumigation which was done early in the season showed that it could be

made to control the pest but the later season work was so unsatisfactory that many thought it could not be depended upon. Report from the infested section today shows successful work done with fumigating tents and sprays. Best work with the spray pump, however, called for two sprayings, which made its expense greater than that of one fumigation, so that as a rule it is presumed the coming season's work will be largely with fumigation. Of the 25,000 acres which show greater or less infestation only some 1200 acres were fumigated, much less than were sprayed. Both the portion treated has, we judge, shown the worst infestation.

The campaign was under the direct supervision of County Horticultural Commissioner Collins and Mr. R. P. Cundiff, former horticultural commissioner of Riverside County. Mr. Cundiff was in the field during the entire campaign. The work began about July 10 and from the first practically no injury was shown by the fruit, and excellent results were secured where full strength tests were given. After September 1 a slight increase in dosage was used and the work was continued until November 15. Some fumigations have been given since but these to a limited extent and purely for experimental purposes. There were six outfits of 32 tents each working under county supervision. In addition there were two private outfits and the weather was so favorable that almost every hour of every night found the tents in action. Because of the widely scattered field the outfits were not operated closely together. This was perhaps an economic error for had the outfits worked in one section, cleaning it up and then moving to another, greater economy could have been practiced in the matter of delivering supplies, repairing tents and general operation. Probably another year will see this plan of work adopted. At no time during the campaign was the cyanide shortage embarrassing.

It is also suggested that an excellent practice followed by some, and which will probably be followed more extensively another year, is to give trees a thorough pruning before fumigation. Especially should the pruning be done as to suckers and as to fruit which is already infested. It has been found that insects located on either the strong sucker growth or on the fruit are much more resistant than those on the leaf or small branches. If these suckers and the fruit which will really be of no value give resistance to the insect because of the abundant flow of sap which they supply it is in any case only an additional proof that they should be removed because they are taking from the tree that which is needed by its other branches. It is a satisfaction to note that none of the fruit on trees which were fumigated subsequent to July 10 were injured. It is possible that another season's campaign will be begun slightly earlier than that date but as small newly-formed fruit is susceptible to cyanide or acid injury and as the scale are not all hatched until about that time it is probable the season will not be crowded very much. As a matter of fact, some young scales hatched that season as late as October and it is hardly probable in any case that a 100 per cent kill could be secured. In all these forms of insect life there are certain sports or out-of-season hatchings.

All told, the season was a most satisfactory one and a triumph for fumigation. Ample provision is made for supplies for another season so that the growers need feel no hesitancy in making plans for a general clean-up of the pest.

ORANGE PASTE

By H. P. D. Kingsbury

An excellent fruit paste may be made from oranges and sugar, and there is nothing better for the purpose of dipping in a chocolate or cream coating, thus making a pure fruit bon bon, or for using in the home as a confection, or as a mixture in pies, cakes, etc.

This paste is easy to make, keeps indefinitely, and will be found even superior to the chunks of candied orange peels and citron peels which are usually used in cakes, as well as being much cheaper.

Take ten pounds of whole, sound oranges and cut them into chunks and run the chunks through the finest knife on your meat grinder, thus making the particles as small as possible. To this ten pounds of finely ground whole oranges add five pounds or pints of water. Put all in the preserving kettle and cook it down, stirring constantly until two-thirds of the water has evaporated off and the paste is fairly stiff. Then add ten pounds of granulated sugar and continue the cooking and stirring until the paste is thick enough so that when the stirring spoon is run into it the hole thus made remains, and all of the water which was added has been evaporated as well as some of the water from the juice of the fruit.

Then pour out into shalow pans so that the layer of paste will be about three-quarters of an inch thick, and let it set into a jelly. It may be set away in these slabs on oiled paper and used as needed. There is a gradual evaporation as time goes on and the paste gets better and better.

It is necessary to be careful not to cook this down to a candying point, or instead of a paste you will have candied ground orange, which will harden. A little practice will perfect the handling of this excellent product.

The cost per pound when making it in some quantity and boxing it for shipment is as follows: Fruit, .003; sugar, .03; boxes, .002; labor, .01; fuel, .02; lining paper, .0003; strap iron for boxes, .0003; power for grinding, .0008, and packing, .001; thus making a total cost per pound ready to ship amounting to about five cents.

This is a product which is largely used by bakers and confectioners, and the large biscuit making concerns as well as in the home for various purposes. It has no foreign competition, and has the advantage of using up the whole fruit.

The method of planting olive trees in Syria is most interesting. The soil is not deeply dug over, but very large holes are prepared for the trees and a layer of stones is placed in the bottom for drainage. Often very old trees are transplanted.

Sure thing, tell the advertiser that you saw his bargain announced in this paper. He will be glad to know what paper you read and what paper it was that brought his message to you.

Deciduous Fruits

IMPORTANCE OF BUD SELECTION

Written for California Cultivator
By M. Sharpe

VARIOUS articles by competent authorities have appeared in several recent issues of the Cultivator in relation to bud sports and mutation of citrus fruits, etc., all of which have been very interesting and of especial importance to growers of fruits in general, for by careful bud selection many bad features and undesirable qualities in some fruits can be entirely eliminated. Take for instance the Petit d' Agen or so-called French prune, one of our most important fruit crops and a staple product when dried. The average man will see no variation in them, but to the close observer a great many variations or types will be found in an orchard all worked on the same stock with very little difference, if any, in the soil. There will be some that are clingstones, others freestones, long prunes and others inclined to rotundity. Some will be much sweeter than others. There will be some trees that are regular bearers and others that are shy bearers, some trees will bear very large prunes and others small ones, some will show very marked characteristics, some will maintain a thriftier appearance than others, and many other variations will appear which, though small, clearly demonstrate the need of careful bud selection in the propagation of a species.

The stock might influence the scion to a certain extent, for instance the Myrobolan root, which itself shows distinct variation in habit of growth, season of ripening its fruit, color of fruit and thriftiness, but the stock could hardly affect the scion to such an extent as to make a freestone fruit a clingstone, and many of these types of the large French prune retain their redeeming features when worked on other stocks.

There are at least five of these large types of French prune growing here in Vaca Valley. They are typical French prunes with the exception that they are of the largest size, drying in the neighborhood of 40's when the others would be drying around 60's to 70's. These large types present an opportunity to do away with the very small prune entirely, and a few progressive nurserymen are already taking advantage of this fact and are trying to convince the public of the advisability of planting these selected types.

Very few growers now raise their own trees so it devolves on the nurseryman to carry out this work which is more or less difficult unless they are able to grow their own buds and scions. Unless a nurseryman employs an expert to obtain his buds for him there is great danger of making a mistake, as many growers have already experienced to their sorrow and financial loss. Very likely this is only the result of carelessness on the nurseryman's part or of putting too much trust in an unknown party who may in turn send the hired man out to cut the buds and he in all possibility will cut them promiscuously from various trees. It is a peculiar fact that there are many men engaged in growing fruit who scarcely know one variety from another, their knowledge being confined to the fact that such a variety sells well, but they would be unable to classify the tree in the dormant state, which demonstrates that one engaged in growing young trees cannot be too careful as to who cuts his buds or scions for him if he wishes to do away with the so-called "boarders" in his orchards and to bring all fruits to their highest point of development. When one considers the value of good fruit land he can ill afford to grow a tree which will never bring him anything in return.

Of course climate and locality have to be taken into consideration in some cases, for some fruits bear well in one locality where they do not in another from sometimes unexplainable causes. Also fruit grown in different districts will sometimes show marked differences in color, shape and flavor. However a great deal can be accomplished by careful bud selection in French prune and citrus fruits particularly.

In most discussions of horticultural subjects there is room for dissension and dispute, for no man, however well versed in horticulture he may be, can say that he knows the fruit business and tell the truth, for if there ever was a business that is forever presenting new angles and difficulties and from which new problems are ever rising it is fruit growing, but even at that it is the most fascinating pursuit on earth to those who appreciate it.

AVOCADOS

Bring $40 to $50 a Box In Los Angeles

—the great future fruit industry of California—

FACTS YOU OUGHT TO KNOW

Avocados will grow and thrive in California. Properly selected varieties will stand more cold than oranges, require no more water nor general care, do not so readily harbor pests, make nearly twice the growth per year, eventually produce several times the number of fruits per tree, and make most beautiful ornamental trees. The fruits grown in California are entirely superior in richness and flavor to those grown in the Tropics, and find ready sale at fabulous prices.

The Avocado is the most important fruit in the world, being at once an unrivaled delicacy and a very valuable, easily digested food product, the use of which will enable the people to largely dispense with meat.

Under scientific California methods of growing, packing and marketing, its field will be the Earth and its culture inevitably become a great industry.

Actual photo. Exact size Avocado grown on ranch of W. A. Spinks.

"As to the value of the Avocado fruit, no one on earth can question that. It is the most nutritious, easily digestible and delicious of all fruits and if it can be purchased in quantity will sooner or later be eaten by everybody everywhere."—Luther Burbank. Extract from letter of Feb. 20, 1915.

Vigorous field grown trees, 2-year-olds from the bud—of rapid-growing, cold resistant and prolific variety 1¼ inches in diameter or larger, $2.00 each. Will bear fruit in from two to three years. Lower prices on quantities. Take advantage of the times and buy at these low prices. Write for complete literature.

Keep this ad in your scrap book and look at it in ten years from now.

Duarte, (Los Angeles Co.,) Cal.

WATER USED BY A PLANT

The following statement concerning the effect of irrigation upon the product of a field is made by Dr. J. A. Widsoe of Utah state agricultural college, and will be of interest to Colorado farmers.

During the life of the plant large quantities of water are passed rapidly from the soil into the plant, and from the plant leaves into the air. As has been shown, hundreds of pounds of water are thus passed through the plant for the production of one pound of dry matter. That the vital processes of the plant may proceed unhindered, the cells of the green plant must be fully filled with water. The more water is in the soil, the more completely are the plant cells filled with water. That is, on a moist soil under conditions of abundant irrigation, the green plant probably contains a larger proportion of water than on dry soil, where the quantity of irrigation water applied is small. This effect is felt most in the stalks of plants. In the leaves, which naturally contain less water than do the stalks, the effect of varying quantities of water is not so apparent; but the water content of every part of the plant is somewhat affected by the water supply. The underground parts of plants, such as potatoes and sugar beets, contain usually a slightly larger percentage

Los Angeles, Cal.

The most important product of the island of Zanzibar is cloves; next come coconuts.

of moisture, when grown on land abundantly irrigated.

Since most crops are not sold green, this effect of irrigation, has little commercial value. True, in the case of fruits, tomatoes and similar crops, which are usually disposed of in an undried condition, the increased percentage of water in crops grown with much water may make considerable difference in the final weight.

Potatoes and sugar beets when irrigated heavily and late, may weigh more per acre, but the increased yield is obtained only at the sacrifice of quality. In most cases the difference is so small as to be negligible.—E. B. House, Colorado Agricultural College.

SCIENCE AND ART OF AGRICULTURE

"Writing and plowing are two different talents; and he that writes well must have spent in his study that time which is necessary to be spent in the fields by him who will be master of the art of cultivating them."

This was written nearly 200 years ago by an Englishman who was instrumental in introducing important changes in the agricultural methods of his day. The actual tiller of the soil has always held in some contempt the "book farmer," and there are sometimes reasons for his doing so. The man who has spent years in scientific research to determine the chemical content of soils and the methods of plant growth naturally magnifies his work. He is apt to forget that successful agriculture includes other factors than those in which he deals. All the alchemy of sunshine cannot be expressed in chemical symbols, and the rains of the springtime and the dews of the summer nights, as well as other agencies of nature, contribute more than we calculate to the final harvest.

But the farmer is equally in danger of underestimating the work of the scientist. The whole world is in debt to the patient investigators who have wrested from nature so many of her secrets. Agriculture has received its full share of the results of this work, from Liebig's time until now. Both national and state governments are each year putting forth increased efforts to bring a better knowledge of the science of agriculture to those who are already more or less versed in the art.—American Fertilizer.

If you would listen to the claims of the quack doctor or the patent medicine vendor, you will have to go to some other medium than this paper. Our columns are closed air-tight and bomb proof against that kind of publicity. We have opportunities enough to take them on. We long ago made the rule against giving space to any of them. We want the good opinion of our readers and are bound to deserve it.

During the month of December, 1914, over 2000 bags of Korean rice were shipped from Kobe to the United States. This is the first reported shipment to America of this rice, and is a sign of the expanding export trade in this product. Despite the low prevailing prices of this cereal, exportation is being pushed, as the farmers must get rid of the last season's crop. Kunsan, the Southern rice center, is reported to be receiving some 7000 or 8000 bags per day.

For a number of years an arbor day has been observed in Spain, having had an official beginning in 1898. In view of the satisfactory results obtained since the introduction of this celebration the Spanish government has found it advisable to make arbor day general and obligatory throughout the kingdom.

Farmers of Mimbres Valley, New Mexico, maintain a cooperative organization which saved to its members last year in excess of $20,000; this almost entirely in fuel and lubricating oils.

TREES

This is the best time for planting and every planter should place his order as soon as possible. In buying from our immense stock you are certain that your order will be satisfactorily filled with perfectly grown, strong, and thrifty stock. Every tree is labeled true to name.

Fruit Trees — Of Every Kind

We have the largest and best grown stock which comprises all the leading varieties of Apples, Apricots, Almonds, Peaches, Plums, Prunes, Oranges, Lemons, Pears, Cherries, Olives, Nectarines etc. The most complete stock in California today.

Ornamental Trees and Shrubs

We have almost an endless variety of all the leading Ornamental, Deciduous, and Evergreen trees and shrubs grown on the Pacific Coast, which comprise the varieties best suited for lawn or street planting; and to ornament the grounds of large private or public parks.

Climbing and Trailing Plants

We have a splendid assortment to select from, embracing the leading varieties of Ampelopsis, Clematis, Ivy, Jasmines, Wistaria, etc. Our line is also complete in bedding and border plants. Our large green and lath houses are filled with the very best assortment of house Palms, Ferns, and other decorative plants.

Field Grown Roses

This stock includes varieties best adapted for hedges, grouping, and for climbers. All the leading late varieties still in surplus.

CALIMYRNA FIGS

This is the genuine Smyrna Fig of Commerce — introduced and successfully grown by us.

Undoubtedly it is the only fig to plant if you are looking for profit.

We are absolute headquarters for the Calimyrna Fig and recognized authorities as to its propagation. Write us for full information. We can also supply the Adriatic types—if you want them at right prices. Mission, White Adriatic.

OLIVES

There is an enormous demand for olives. Our stock includes all the best varieties—Mission, Manzanillo, etc.—grown under ideal soil and climatic conditions with strong, sturdy root systems. Ask for a copy of our special bulletin on the olive—free.

Write for a Copy of Our Illustrated Price Catalog

containing prices and brief descriptions of over 2000 varieties of trees, plants and vines—the most complete stock on the Pacific Coast. A copy of our 1915 catalog will be sent free on request to any address

PAID UP CAPITAL $200,000
FANCHER CREEK NURSERIES Inc

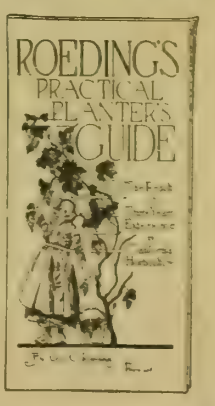
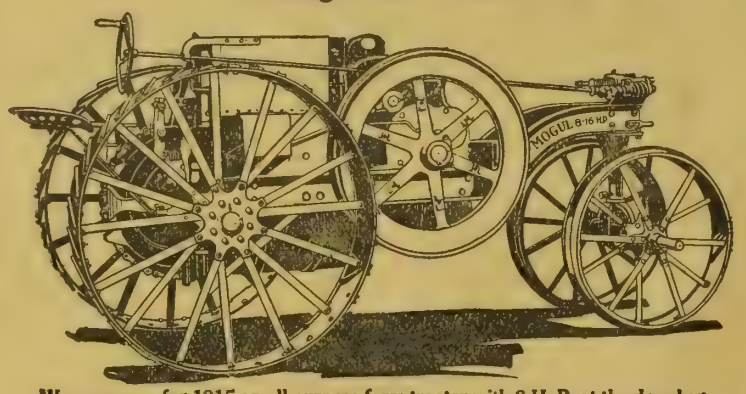
Box 12 Fresno, California

—or better yet
Send for a copy of this forceful and valuable planter's guide.



THIS BOOK should be in the hands of every planter and grower. It tells how and when and where—to plant, prune and care for stock—and is fully illustrated, showing "before" and "after." The price is 25c—but to those who write now for prices and suggestions we'll send a copy free. WRITE YOUR NAME AND ADDRESS ON THE MARGIN below, tear off and mail today—attaching a list of what you intend to plant.

Our New Year's Announcement
A Mogul Oil Tractor for $675



We announce for 1915 an all-purpose farm tractor with 8-H. P. at the drawbar and 16 on the belt—Mogul 8-16

A Small-Farm Tractor for all Farm Work

THIS new Mogul 8-16 tractor has power to do the work of eight horses.

Being a four-wheeled, all-purpose tractor, you can use it every working day.

It will do all the plowing, disking and seeding.

It will draw manure spreaders, wagons, hay loaders, mowers or binders.

It will run a corn sheller, feed grinder, small shredder, thresher or ensilage cutter.

Any farmer can buy this new Mogul 8-16 tractor for **$675.00, cash, f. o. b. Chicago.**

The man who can use one of these Mogul tractors pays, at this price, the least for which a good, reliable, all-purpose 8-16 tractor can be sold.

If you want to use a Mogul small-farm tractor for spring work, your order should be placed now with the I H C local dealer.

Write us for full information.

General Agriculture

THE EXTERMINATION OF UNDERGROUND PESTS WITH THE UNITED STATES DESTRUCTOR

FOR seven years the public health service of the government has been working in cooperation with the state board of health for the purpose of preventing the spreading of diseases that are carried by rats and ground squirrels. All disease, as a result of their combined efforts, disappeared from among the rats over five years ago. The ground squirrel problem however was much more difficult than the rat problem, and it has required a much longer time to obtain the same degree of success on account of the large territory requiring investigation.

The territory under investigation comprised an area of over 13,000 square miles and consisted of the counties of Contra Costa, Alameda, Santa Clara, Santa Cruz, Monterey, San Benito, Merced, Stanislaus and San Joaquin. The state legislature passed an act which required land owners to destroy ground squirrels and similar rodents and the various boards of county supervisors have loaned their moral and financial support to the movement on account of the great economic benefits which would accrue to their respective counties from wide spread ground squirrel destruction.

As a result of the combined efforts of the United States government and state authorities and the cooperation and assistance of wide awake and progressive land owners, about 75 per cent of the ground squirrels in the counties above mentioned have been destroyed and disease has practically disappeared from among them. The location of land on which infected squirrels are still found is known and the squirrels that remain on these lands are being rapidly destroyed. It is believed that all disease will be wiped out within the next few months.

While it is admitted that the suppression of disease over so wide an area is a creditable achievement, the writer was much more impressed by the enormous economic benefits that will accrue to farmers, orchardists and ranchers as a result of the wide spread destruction of these pestiferous little animals. The government officials who have charge have not overlooked this fact and have taken advantage of every opportunity to demonstrate that it means money in the pocket of every one who has squirrels on his land if he will destroy them.

As the principal interest of the government was to get rid of disease it fell to the medical department to take charge of the work, and while they personally knew about diseases and their devious ways of spreading and had had much experience in the destruction of rats and in the cleaning up of cities, the destruction of ground squirrels was an entirely new problem and as it later proved, a most difficult one. A beginning was made by studying the squirrel himself and the following facts were established:

Ground squirrels live in burrows in the ground about eighteen inches to two feet below and more or less parallel to the surface.

These burrows are, as a rule, connected and interconnected so as to form what are known as colonies or villages.

Each burrow has an entrance which communicates with the surface. The average length of each burrow is about 15 feet, with a capacity of 1.5 cubic feet.

The breeding season begins in November or December and the young are born from March to June, depending upon the locality, climatic conditions as to cold, rain, vegetation, etc.

Each female gives birth to an average of eight young, the litter varying in number from four or five to a dozen or more.

When the young are six weeks to two or three months old they either leave or are driven out of the parent "village" and establish villages of their own.

Ground squirrels will eat anything. They prefer farm or orchard products as a rule but when driven by necessity will eat garbage or their own dead.

Ground squirrels are very destructive as the following brief statements will show:

Growing crops of wheat, oats, barley, hay or alfalfa, orchard or vineyard products, garden truck, etc., are destroyed in great quantities each year. They seem to take an especial delight in cutting the heads from wheat, oats and barley just before the grain is ready for the harvest or, as the farmers say, while it is still "in the milk."

Banks of irrigation canals and ditches and the embankments of dams are frequently undermined and disastrous floods result. They burrow into railroad cuts and fills, causing slides and cave-ins.

In pasture land each squirrel will destroy in the construction of his burrow about seven square feet of pasturage and it has been estimated that 20 squirrels will eat and destroy enough pasturage to feed one cow.

Methods of squirrel destruction have been carefully tested by the United States government and their efficiency proven as follows:

Poisoned Grain

This agent gives better results in the dry than in the rainy season. It is used by scattering on the ground back of the hole in such a manner that the squirrel is obliged to pick it up a grain at a time and place it in the cheek pouch. Absorption of the poison takes place through the lining of the cheek pouch and death results, many times, before the animal has had time to hull and eat any of the grain. Barley is the best grain to use as it must be hulled to get the kernel, hence birds and other animals are not likely to touch it. Squirrels cannot be completely eradicated by the use of barley as some of the older ones have learned by experience to leave it alone. However, if it is applied to the land at intervals of 10 days, about 80 per cent or 85 per cent will be destroyed and the balance can be killed by the methods that will be later described. Grain is especially applicable on pasture or range land or on land where rocks or rocky formations are present.

The poison used is strychnine and there are two methods of preparing it. By one method the grain is coated with an adhesive solution containing strychnine and by the other method the grain is coated in the same manner but the strychnine is so treated before applying that its bitter taste is delayed for several minutes. If the expression may be permitted, "before the squirrel can taste the poison to find out what killed him, he is dead."

Waste Ball Method

What are commonly known as "waste balls" may be made of any absorbent material, as jute, cotton, gunny, waste, a ball of horse manure or an oak gall. Jute or cotton has been found to be the best.

A ball of any of the above materials is soaked with Kilmol, placed in the burrow and if the ground vegetation is wet so that there is no danger of fire, it is ignited. An explosion results which usually stuns the squirrel and the resulting poisonous gases kill him. After firing, the hole is covered with dirt and stamped to confine the poisonous gases and give a surer result.

If the ground and vegetation are dry enough to burn it is better not to ignite the ball but to cover and tamp the hole and allow the liquid used to evaporate and produce the gas. The liquid used and results obtained are as follows:

	With Firing	Without Firing
Kilmol	98-100%	90-95%

As will be noted, the poisoned grain is applicable in the dry and Kilmol in the wet season. They cannot be combined so as to obtain the best results from both in the same season. To overcome this difficulty the government officers determined if possible to devise a method which would fulfill the following requirements:

Efficiency. It was their earnest endeavor to devise a method that did not depend upon the cooperation of the squirrel and would obviate the necessity of going over the land more than once.

Applicability during the entire year without regard to the season.

Low cost of construction, maintenance and operation.

Light weight so as to be easily carried and not difficult to use or operate.

After many trials and failures an apparatus known as the Squirrel Destructor was invented and, as is usual with officers of the government, was patented and dedicated to the public. Anyone may have the benefit of its use without the payment of large expensive royalties. The United States Destructor is a simple machine easily understood and handled, and inexpensive to maintain. It consists of a double action air pump, a reservoir for holding the poisonous liquid to be used, a measuring cup and a vaporizing chamber in which the poisonous gas is produced. Twenty full strokes of the pump forces sufficient air through the vaporizing chamber to produce thirteen cubic feet of poisonous gas. As the capacity of the squirrel burrow is only 1.5 cubic feet, considerably more gas is pumped in than is required to fill the burrow. This insures a complete substitution of the air in the burrow and kills the squirrel in from ten to twenty minutes. Kilmol is used with the Destructor with an efficiency of 99 to 100 per cent.

MEASURING HAY IN STACK

Neither Uncle Sam nor most states have a law for the measurement of hay in stack. Wyoming statutes provide the following:

Four hundred twenty-two cubic feet shall constitute a ton of clean native, blue joint hay after 30 days and up to three months settlement in stack. Five hundred twelve cubic feet shall constitute a ton of alfalfa rough slough grass after the same shall have been in stack 30 days and up to one year. Four hundred and fifty subic feet shall constitute a ton of clean timothy or clover after the same shall have been in stack for 30 days up to one year.

The law further provides the following rule for determining the number of feet in a stack: Subtract the width from the "over," divide the remainder by 2, multiply this by the width and multiply this by length. (All measurements are to be in feet). Divide this result by the number of cubic feet in a ton.

The laws of New Mexico contain the following:

To reduce to tons, for hay that has stood in the stack for less than 20 days, divide the cubical contents by 512; for more than 20 days and less than 60 days, divide by 422; for more than 60 days divide by 380.

The New Mexico rule for measuring the stack is the following: Multiply the width by the "over," divide this by 4, and multiply this by the length. Divide this number by the number of cubic feet in a ton and you have the answer in tons.

The only other state which has a statute upon this subject, so far as we are able to ascertain, is Montana, and there the law is almost precisely the same as in Wyoming.

The United States department of agriculture furnishes us with the information that in New York and Virginia 55 stacks of hay which had stood less than 30 days averaged 589.6 cubic feet per ton. Thirty stacks having stood from 30 to 60 days averaged 581.5 cubic feet per ton, while seven stacks which had stood from 74 to 155 days averaged 514.9 cubic feet per ton. —S. L. MacDonald, Colorado Agricultural College.

There is nothing like cooperation in the farm home. A pull-together by the whole family argues well for eventual success in any line.

Just imagine the axle of a car TWISTED 3 TIMES without even showing signs of fracture, and you can begin to get a little idea of the quality that Studebaker BUILDS into this FOUR—simply "because it's a Studebaker." For that's the test—as this picture shows—that Studebaker axles have to undergo. And that's the kind of steel that Studebaker develops.

No car that ever goes on the road will ever have to face a trial one-hundredth as drastic as this axle test. But it's Studebaker's belief that every Studebaker Car ought to be built as strong as that—with that much extra safety and that much longer life.

And that is typical of Studebaker's entire manufacturing policy. That is why, for example, you find Timken Bearings *everywhere* in the car, even in the differential. They are the BEST anti-friction device made—and Studebaker uses them. So, too, Studebaker puts into this FOUR at $985 a FULL-floating Rear Axle such as you find in only the highest priced cars.

But you'll appreciate even more what that name of Studebaker stands for on a car when you see this FOUR at your local Studebaker dealer's—and see how Studebaker, knowing the farmer's wants so well, has built into this FOUR conveniences and SERVICE-giving qualities that make it ideal for use in the country.

But SEE it at your dealer's. You'll find it EASY-riding and EASY to drive—and with lots of POWER. And when you study its design, its simplicity, its accessibility and the way it is built to make its upkeep LOW, you'll see why so many men living in the country have bought this FOUR simply

—because it's a

A FARMER'S FRIEND

THE toad is one of the farmer's best friends. He hides during the heat of the day under stones, sticks or any kind of rubbish he can find that will afford shade and moisture, but as soon as the day grows cool he sallies forth in quest of food, which consists principally of insects.

It is a common superstition that to kill a toad will cause the cows of the offender to give bloody milk, which, though without foundation in fact, is productive of good by deterring the slaughter of the innocents by cruel boys.

Like many others of the animal kingdom, the toad sloughs his skin; but you never can find their cast skins around as you do those of snakes. Only once have I been permitted to see a toad change his raiment. I saw one in a shady place beneath a large clod. He acted as though he were in severe pain. Presently I saw the skin on his back beginning to split. The opening grew larger and larger, till at last he worked it forward and off his hind legs, for all the world like a boy taking off his trousers. Next he worked it off his front legs and with his feet he pushed it off his head, rolled it up into a ball and—what do you think! He swallowed the pellet as though it were a delicate morsel.

Formerly he was thought to be venomous, but the idea is absolutely without foundation. His body is covered with wart-like protuberances which on pressure exude a milky liquid of a very acrid taste. Many a time have I seen dogs play with toads, but observed that they were careful not to get the little creatures in their mouths. No doubt they had learned the toad's weapon by experience.

Though he appears to be a clumsy fellow, often have I watched him before my team and he always so timed and spaced his leaps as to escape death by hoofs and wheels. Still he is not active enough to spring upon insects. How does he catch them? His tongue, which is an inch or more long, is attached to the front of his mouth and free behind. When a fly comes near enough the tongue is thrust quickly out, the fly is enveloped and drawn back into the mouth so quickly that the eye cannot follow the movements.

Toads are local in their habits, as are in fact many animals thought to be wanderers. The toad you saw hopping around your yard last summer is the one which will appear next summer and has been doing police duty in your yard and garden for several years.

The number of insects a toad will consume is almost incredible to one who has not observed his habits, and as he is not particularly choice in his selection of food, he destroys vast numbers of injurious insects. His utility as an insecticide is so well known that in some places he has a market value for placing in gardens.

The toad exhibits a considerable degree of intelligence and is easily tamed. I knew of three toads that had been tamed by some children. After having been carried into the house a few evenings they became so tame that they would hop up on the porch and wait for the door to be opened, then they would calmly hop into the kitchen and watch for flies. They became so tame that the children could catch them anywhere in the yard and carry them around without their making any effort to escape. Each succeeding summer three toads applied for the job and we supposed them to be the original ones.—Successful Farming.

TRIUMPH OF THE ITALIAN TOMATO

The tomato was given to the world by America, but Italy is today teaching the rest of the world by example how it should be raised and how it should be preserved. Italian canned tomatoes have practically pushed the American product out of the English market and have gained an enormous market in the United States. The Italians raise a solid meaty tomato of fine color and it is so packed in the cans that the consumer is not obliged to pay for a large percentage of water.

Canned tomatoes, however, are put up principally for the export trade. The Italians themselves prefer their tomatoes in the form of sauce, or paste, which is nothing more nor less than boiled down tomato pulp, minus the skins and seeds, as set forth in an interesting manner in a report by Commercial Agent J. Alexis Shriver entitled, "Canned Tomato Industry in Italy," recently issued by the bureau of foreign and domestic commerce. This sauce is put up in cans and is used by the Italians in a great variety of dishes, of which spaghetti is perhaps the most familiar to Americans.

According to fairly accurate statistics the area planted in tomatoes in Italy is about 22,000 acres, producing about 385,000 tons. The exports to the United States amount to about 20,000,000 pounds of canned tomato and tomato sauce, and some 8,000,000 pounds of the product go to South America. The total value of the tomato exports from Italy is well over $6,000,000.

The skins and seeds that were formerly wasted are now utilized, the former as stock feed and the latter as a source of oil. The crude oil is suitable for soap making and for lamps, and the refined oil is said to be edible. Commercial Agent Shriver's report, Special Agents Series No. 93, may be obtained from Superintendent of Documents, Government Printing Office, Washington, at 5 cents a copy.

GARDEN NOTES

No place is too small to afford some garden or plant growth.

Do not cover fine seed deeply. Put on just enough dirt to cover the seed.

Use wood ashes as a garden fertilizer, working them into the soil of rose beds and about fruit plants.

Good topics for discussion in the farmers' club this month are:

The Vegetable Garden.

The Best Potatoes to Plant.

How to Secure a Good Strawberry Bed.

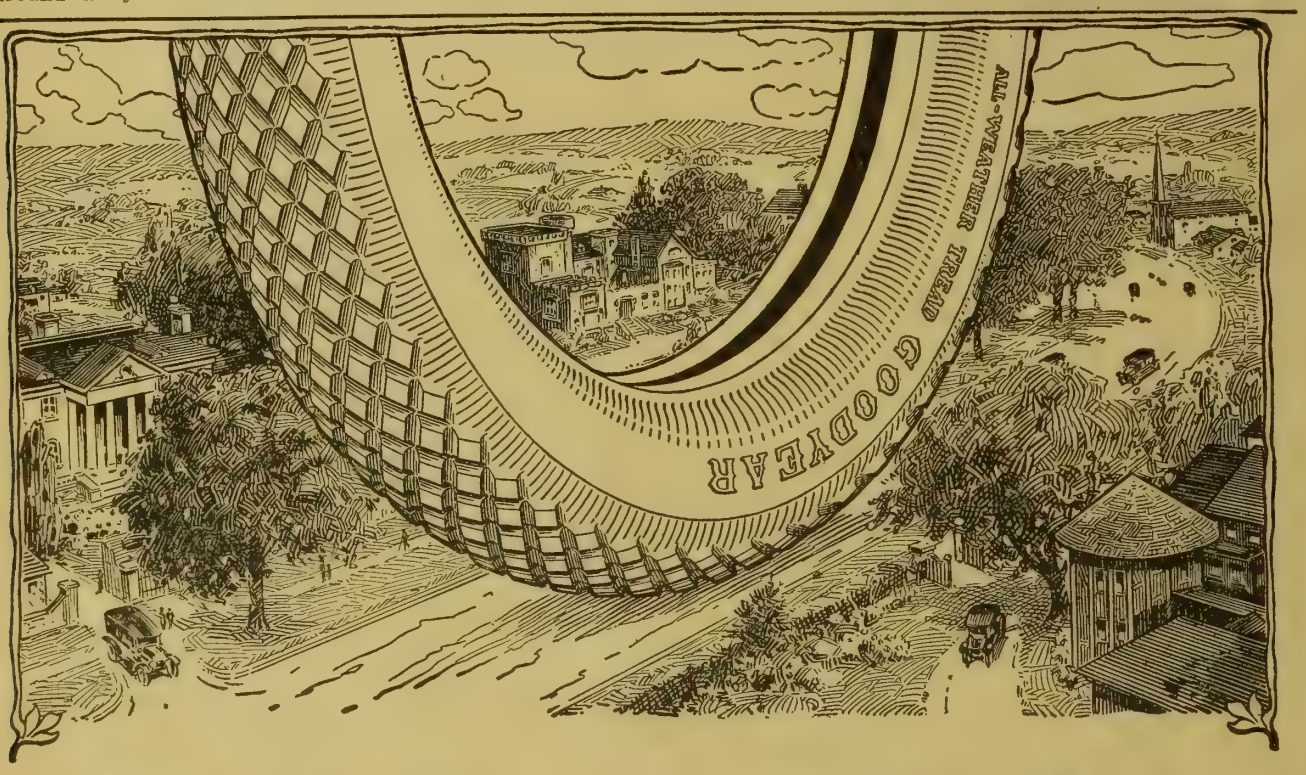
The Best Shrubs to Plant for a Succession of Flowers All the Year.

The Best Annuals for Cut Flowers.

The Best Three Flowering Perennial Plants.—LeRoy Cady, Associate Horticulturist, University Farm, St. Paul.

The manure from a well-fed herd is a matter of great consequence, and its proper management requires judgment. The better the feeding the better the manure. While all manure is worth good care, the better the manure the more important it is to handle it well to prevent heavy losses. The best single piece of advice as to handling stable manure is to get it from the stable to the land where wanted without delay and there spread it with the least possible expenditure of labor. Yet this general plan must be modified at times, and according to circumstances.

Sheep are different from cattle or of value as meat producers they have a fleece wool that will pay for their feed.



Goodyears Average Best

That's Why They Dominate Every Road and Street

Some hundred makers now build tires. Yet Goodyear made about one-fourth of all tires used last year.

We sold 1,479,883—about one tire for every car in use. And for years these tires have far outsold any other tire that's made.

Now our prices are about the same as others, due to our matchless output. Our Fortified Tires, with their costly, exclusive features, were once the highest-priced.

Today there isn't a reason why every motorist can not have Goodyear tires. There are these reasons why he should:

This one exclusive process costs us $450,000 yearly.

We combat loose treads by forming in each tire hundreds of large rubber rivets.

For security against blowing off the rim and tube pinching, each tire base embodies six flat bands of 126 braided piano wires.

Our All-Weather Tread combats puncture by being tough and double-thick. It combats skidding like no other by its sharp-edged bulldog grips.

Those things mean sturdy, trouble-saving tires. Each is found in Goodyear tires alone. In these ways, at least, Goodyear Fortified Tires excel all other makes. Do you know one way in which others excel Goodyear?

We urge you to prove these tires. Once do so and you'll never give them up. Any dealer will supply you.

These 5 Reasons

Our No-Rim-Cut feature —ours alone—combats rim-cutting in the best way known.

Countless blowouts are avoided by our "On-Air" cure.

KNOW THE TREES

Written for California Cultivator
By Ernest Braunton

SO many eager inquiries come in every year as to identity of native trees that it may be well to lay down a few rules for their rough recognition. Few care for specific names, and nearly all know the pines, etc. It is the deciduous tree that most puzzles us, and to know if it is an alder or an ash generally satisfies the seeker for knowledge.

In America we have but three families of trees possessing opposite leaves, and all have representatives in California and will be found fairly close to stream banks. It is not necessary to find them in leaf to know them—look to see if leaf scars and buds are opposite, and if so the tree is either ash, maple or horse-chestnut. If they are not opposite they as clearly belong to some other family, of which we do not tell in this article.

We have but one horse chestnut, Aesculus Californica, a small tree 10 to 20, or rarely 30 feet high, and sometimes a mere shrub of five feet, though swollen bases of trunks are as much as three or four feet in diameter at surface of soil. It is easily told from other opposite-leaved trees, even when bare, by the very blunt and stubby twigs. In geographic range this tree reaches neither the northern or southern end of the state. It is somewhat common from the Salmon River south to the Antelope Valley in Los Angeles County.

California can boast of but four maples, and but two of these grow large enough in their native habitat to be called trees. The big-leaved maple (Acer macrophylla) grows from 20 to 60 feet high and ranges throughout the state but is nowhere common. It is a handsome tree and planted out it thrives in the big interior valleys. Acer circinatum, the vine maple, is a shrub or small tree from five to 20 feet high and is found in the north, not occurring so far south as Sacramento. It may generally be told by the four or five spreading stems which often curve over so that the tips touch the ground and take root; hence the common name, the vine maple. Acer glabrum, the Sierra maple, is also a dwarf of five to 10 feet, found from the San Bernardino Mountains northward at an elevation of from 6000 to 8000 feet. In the south it generally is a one-stemmed shrub, but in the north it frequently has from ten to a hundred. Acer negundo, var. Californicum is the California box elder and in gross aspect closely resembles those so common in the Eastern states. It is a tree of 20 to 50 feet in height and ranges from the San Bernardino Mountains northward to the Sacramento River, always along streams, but nowhere common. In lowlands or in sandy, damp soils it makes a fine tree and is utilized for shade purposes and alignments of roadsides.

Out of 30 species of ash found throughout the world, mainly in the north temperate zone, California claims five, and all attain, somewhere, the dignity of trees. Fraxinus Oregona, the Oregon ash, ranges from 30 to 80 feet in height and from San Diego north in territorial appropriation; also growing from tidewater to 4000 feet altitude in the mountains. F. Coriacea, the leather-leaf ash, runs from 20 to 30 feet in height and is found in desert regions from the east base of Mt. San Jacinto to Central California and over into Utah, Nevada and Arizona. F. velutina, the Arizona ash, does not reach far into California, being found from Mt. San Jacinto and Owens River region southeasterly. It is quite easily recognized by the extreme willow-like appearance of its leaflets. F. dipetala, the flowering ash, is a small tree or shrub from five to 15 feet in height and found in canyons in all sections of the state excepting in desert regions. It is a most beautiful tree when in blossom and is then easily told by its heavy clusters of flowers, each one of which has but two petals. Fraxinus anamola, the dwarf ash, is a large spreading shrub or small tree from 15 to 20 feet high, and found in California only in the Death Valley region, and therefore interests us but little. In all countries where Spanish predominates the ash is known as Fresno, from which fact our California city was named, and many ashes, planted, and also native growths, are found there. These are all the trees having opposite leaves that are native to California.

Plant Roadside Trees

1915 is sure to be a year of unusual activity in all lines and in all parts of California. I sincerely hope some of the energy and enthusiasm of our people will be expended in the planting of our roadsides. In Southern California proper, or below the Tehachapi, these trees should be mainly evergreens, but in the central and northern parts they may be a mix-

BOOKKEEPING FOR COOPERATIVE ORGANIZATIONS

DOUBLE entry bookkeeping is urged upon all farmers' cooperative societies in a recent publication of the United States department of agriculture, Bulletin No. 178, "Cooperative Organization Business Methods." The very life of a cooperative organization, says the bulletin, depends upon the confidence its members possess in it, and such confidence is impossible unless the records are unmistakably accurate. The double entry system is the only one which affords a complete check and should therefore be adopted in all cases.

Since the cooperative organization acts as the agent of the grower in marketing his product, the books of the organization must not only contain the usual records of any business enterprise but must also show a clear record of each grower's shipments. The system must be sufficiently elastic to take care of the maximum volume of business at the busy seasons and at the same time be economical.

The six essential requirements for such a system are stated in the bulletin as follows:

A complete set of financial records showing the business tranactions and the results thereof.

A record of each member's transactions with the organization.

Capability of taking care of a maximum amount of business during the shipping season.

Capability of returning to the members the proceeds from their products within a reasonable time.

Clear pooling records when kept, so that any discrimination can be shown quickly.

Auxiliary records which will give statistics and valuable information for the conduct of the business. These records must be accurate.

The necessity for providing a regular system for safeguarding the cash is also emphasized in this bulletin, and nine precautions are given which it is said should be adhered to strictly.

All entries of cash should be explicit, and items supporting such entries should be filed so that they are accessible for reference and verification.

No entries should be recorded in the cashbook which do not relate to cash.

The full receipts of each day should be deposited in the bank.

All canceled checks should be filed in numerical order.

Duplicate checks should always be covered by indemnity bonds.

Reconciliation should be made each month between cash or check register and bank passbook balances.

Permanent record of these reconciliations should be made.

Checks, sales slips, receipts, etc., should be numbered with a numbering machine. Any which are spoiled should be marked void and left in the book.

A regular system should be used for the acknowledgment of all cash sales, or miscellaneous cash items received.

The auditing of accounts also should receive more attention than is frequently the case. At least once a year an expert accountant should go over the books of the organization. To minimize the cost of this, small associations or circles can be fomed by the organizations within a certain radius and a competent auditor can be engaged to do the auditing for all.

HOW RIVERS ARE MEASURED

To show the way in which rivers are gauged—that is, how the volume of running streams is measured—by the United States geological survey, the exhibit maintained by the survey at the Panama-Pacific Exposition in San Francisco will include a display of automatic gauges run by electricity, which report the fluctuating heights of water of an artificial river, one flowing through a bank. The work of measuring the flow of the various streams of the United States every day in the year and some of them several times a day affords an invaluable basis for the study of our water resources. Upon the data thus obtained engineers depend in working out plans of water power development, irrigation, drainage—in fact, every project in which running water is a factor.

ONE TREE BRINGS $100

The government has just received $99.40 in settlement for a single sugar pine tree which was cut in trespass in the Stanislaus national forest in California and which yielded more than enough actual lumber to build a good-sized suburban frame house. The tree scaled 18,933 board feet, and was valued at $5.25 per thousand feet.

Not many trees contain enough lumber to build a two-foot board walk nearly two miles long, and this is believed to be the first case on record in which a single tree felled in a national forest was valued at almost $100 on the stump, although national forest timber is frequently sold at considerable higher rates.

PROPOSED LEGISLATION

Continued From Page 291

allow any citizen to deliver any produce of his farm to the market to be sold, and the money received placed to the citizen's credit without cost to him. The expenses of the market shall be paid by the county. The market may sell at retail, wholesale or on commission. Products of the farm include poultry and eggs.

S. B. 188, By Mr. Cogswell—Creates a department of agriculture and the office of secretary of agriculture. Provides for the appointment of a secretary of agriculture by the governor for four years, his salary to be $7500 per year, and consolidates under his department the state agricultural society, commissioner of horticulture, state board of horticultural examiners, state dairy bureau, examiner of veterinary medicine and the state veterinarian, state board of sheep commissioners, stallion registration board, state board of viticultural commissioners, state superintendent of weights and measures. Provides for the organization of the department of agriculture into three bureaus, namely, animal industry, horticulture and economics, with a head for each bureau, to be known as a director. The secretary is vested with the power and the duty of administering and enforcing the laws governing his several departments. The bill creates also a board of six managers in control of the state fair. They shall serve without compensation other than their necessary expenses.

S. B. 205, By Mr. Kehoe—Provides for the establishment of state parks in counties. Upon petition of 25 per cent of the county registors upon the question of a bond issue to purchase a designated tract for a public park, the supervisors shall call a special election to vote on such bonds, or, if a general election takes place within six months, the question of issuing

CASE "25"

Complete $1350—5% Discount If Cash

If We Equipped and Priced as Others Do

$1239.75

Of the 30 medium-priced cars—from $1250 to $1500—the CASE costs the least.

This is the only car that comes *completely* equipped with Extra Casing, Tire Cover and Extra Inner Tube On Rim, Weed Non-Skid Tire Chains, and Eight-Day Clock.

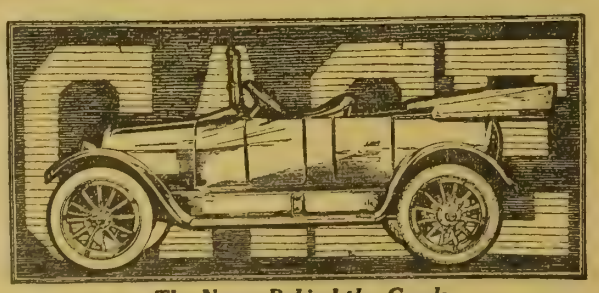
On any other car, men have to pay extra for all these necessary features.

The farmer requires them even more than the man in town. Because you drive in the country six days to his one. You are much more remote from garages and service stations.

These features, **with 5% discount** that we give if cash, amount to precisely $110.25.

Add this to the price of any other car in this class, and it costs you more than the CASE "25" *complete* at $1350.

Or deduct it from the $1350 price of the CASE, and this car costs but $1239.75, on their basis of price and equipment.



The Name Behind the Goods

Hidden Values

CASE buyers count this low cost an extreme advantage. Yet these cars have never been sold on price. They are winning men everywhere because of the way they are made and the stuff that's in them.

These are the "unseen values" in the *vitals* of a car. And you must rely upon a maker's *ability* to build them *right*. Also his *reputation* for *embodying* them.

Your Safeguard

In both of these respects CASE stands, as you know, without a peer.

We have won, through more than 70 years, acknowledged leadership as makers of farm power machinery. And motive power is the basis of an automobile. So—when it comes to you, as it must, to rely on the name behind some car—

Remember that CASE means utmost *security*.

* * * * *

And remember that CASE cars are sold by our own organization. All over America, and beyond, it handles this car in connection with our other products.

Hence we *save thousands* where other makers *must* spend—in selling. And so we spend in many ways for better materials and workmanship. *These are ways where others must save.*

Our new illustrated catalog tells you of many of the places where we spend to your advantage.

Before you buy a car, write for this book and learn the facts that save your repair bills.

NOTE:—Ask us also for our 1915 catalog picturing and describing CASE Threshing Machinery, Tractors, CASE-Racine Tractor Gang Plows, Corn Shellers, Hay Balers and Road Machinery. Sent free, postpaid.

CASE

The Car With the Famous Engine

Dept. 523
Racine, Wis.

(281)

bonds may be submitted at such general election. The care and control of said park will be in the hands of a board of five trustees, appointed by the governor, which board shall serve without pay other than their mileage and $5.00 per day when actually engaged. The governor may appoint said trustees for any county, when in his judgment, it would advance the interests of the movement to acquire said park in such a county.

S. B. 341, By Mr. Brown—This is known as the state market bill and creates a state marketing commission of five members appointed by the governor for six years from the state at large.

The annual salary of each commissioner shall be $6000, the salary of the attorney, $4000; the salary of the secretary, $3000; the salaries of all other officers, experts, accountants, inspectors, clerks, laborers, employes and other persons under the commission shall be fixed by the commission.

The commission shall establish at least two offices, one in San Francisco and one in Los Angeles. The commission shall have power to organize, manage, control and carry on the business of receiving on consignment, selling and shipping to dealers and consumers, within or without the state, all agricultural, horticultural, dairy and farm products which shall be grown, raised, produced, processed or manufactured within the state. All producers within the state shall have a right to consign their products to the commission for sale and distribution. The commission shall establish in other cities and towns such receiving and distributing stations as are necessary. It shall be the duty of the commission to maintain a bureau of information and correspondence. It shall charge all producers taking advantage of this act such fees, charges and costs as may be just and reasonable. Two hundred thousand dollars is appropriated to establish the commission.

S. B. 393, By Mr. Cogswell—Creates a department of natural resources with a secretary at $7500 per annum. He shall take over the duties and exercise all the powers of the state board of forestry, the state forester, California redwood park commission, conservation commission, fish and game commission, state register of land under the Carey act. His department shall be divided into three bureaus, forestry, fish and game, and public land. The head of each bureau shall be known as a director.

S. B. 459, By Mr. Benedict—Provides for the formation of flood control districts in the counties of the state for the purpose of protecting land therein from damage from storm waters, and of the necessary works of protection and conservation of such waters for bonding and assessing such flood control districts, and for the cost of maintaining and repairing such improvements; provides for the appointment in any county by the supervisors of a flood control commission, whose salary shall be not less than $2500 per annum.

S. B. 476, By Mr. Jones—Establishes a deciduous fruit experiment station, under the direction of the University of California, the commissioners of which shall receive no compensation other than their necessary expenses. The sum of $50,000 is appropriated to carry out the act.

S. B. 480, By Mr. Duncan—Defines the commission merchant as any person or persons selling or receiving for sale any produce, etc., on commission. Prohibits such merchant or merchants from doing any business before having filed with the secretary of state a statement showing whether said merchant is a private individual, corporation, partnership, or association, and if a corporation, the amount of stock actually subscribed and paid in. This statement to be verified under oath, accompanied by a bond of $5,000 approved by the secretary of state, conditioned that the said commission merchant will conduct his business within the terms of this act and will control, account for, and promptly pay to any and all persons consigning produce, or other personal property, to him, the proceeds of the sale, less his commission.

Any person suffering loss or damage through the acts or ommissions of said commission merchant may recover upon such bond the amount of damage sustained by him.

Every person conducting the business of a commission merchant shall keep a record showing in detail the receipts of produce or personal property, its character and quantity, dates sold, price received, and residence or business address of the person purchasing the same, which record shall be open at all times to the inspection of any person or persons sending produce to said merchant. Provides further, that said merchant shall, within five days after the sale of said produce, or any part thereof, render to the consignor a detailed statement of the funds required to be kept on record by said merchant. Violations are punished by a maximum fine of $300 and imprisonment not exceeding six months, or both.

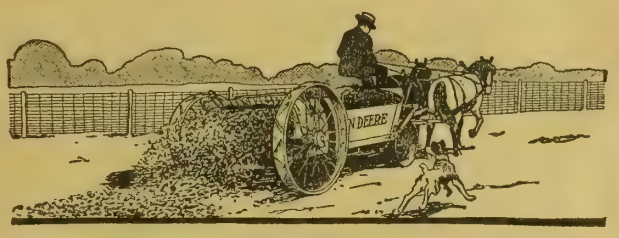
S. B. 508, By Mr. Brown—Creates a state rural credit fund, appropriating $200,000 therefor in aid of agriculture within the state. Creates a board of trustees, consisting of secretary of agriculture, superintendent of banks, and one other person appointed by the governor, at a salary of $5000 who shall be chairman of the commission.

The board is authorized to make loans payable in annual installments, secured by first mortgage on agricultural land, to approved borrowers, for not to exceed 35 years, at not less than four per cent interest. The trustees are authorized to issue tax-exempt mortgage bonds, to purchase mortgage loans on agricultural property from state and private banks, to reduce interest thereon to not less than four per cent, to frame regulations for rural credit associations, and make loans to the members secured by first mortgage, and may accept deposits or reserve funds and pay interest thereon.

S. B. 509, By Mr. Brown—Authorizes the secretary of agriculture to purchase, improve, subdivide and sell agricultural lands to settlers in California. Provides the conditions by which such lands may be purchased on installments. Authorizes the issuance of land settlement bonds with which to create funds for the purchase of agricultural lands, water rights, etc.

S. B. 603, By Mr. Carr—Relates to the formation, government and operation of highway lighting districts within unincorporated towns and villages, and maintains systems of street lights on public highways, and the manner of calling and holding elections, the assessment, collection and disbursement of taxes for said districts.

John Deere Implements



John Deere Spreader

The Spreader with the Beater on the Axle

The beater—the business part of the spreader—and all its driving parts, is mounted on the rear axle. This is a patented feature. You can't get it on any other spreader. The beater on the axle means there are no clutches to give trouble, less than half the parts heretofore used on the simplest spreader, big drive wheels and a low down spreader without stub axles. Only hip high to the top.

Write for more facts. Also ask for "Farm Manures and Fertilizers", a valuable textbook you can get free.

R. & V. Gasolene Engines

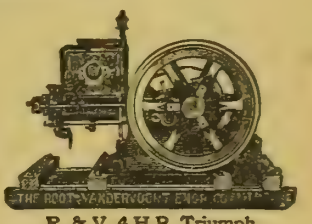
New Triumph One Horse Engine. Just the engine for light work about house and barn, such as running washing machine, pumping water and operating other small machines. Saves every member of the family work and worry.

A reliable, efficient, low priced but high grade engine. Easy to start, smooth running, requires no attention when in operation, economical in use of fuel and perfectly safe in and around buildings. All working parts are back of the fly wheel out of the way—a neat outfit in every respect.

R. & V. Triumph Engines for All Farm Machinery

The R. & V. Triumph line of engines is also made in 2, 4, 6, 8, 10, 12 and 16 H.P. sizes, stationary and portable. Every farm can use one or more of these engines to advantage.

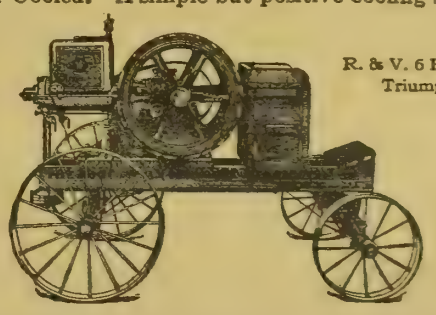
They are dependable gasolene engines—always develop rated horse power.



R. & V. 4 H.P. Triumph

An extra ring over the piston pin prevents scoring and ruining cylinder. This is an unusual precaution for lengthening the life of a gasolene engine. This careful attention to details is followed in constructing every part of the R. & V. Triumph.

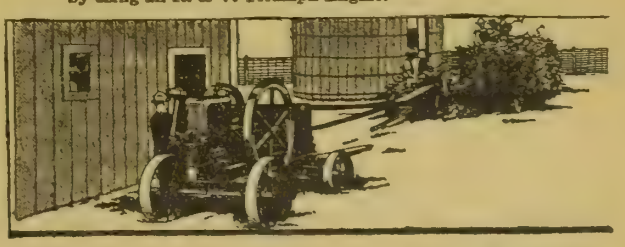
Hopper Cooled. A simple but positive cooling system.



R. & V. 6 H. P. Triumph

The gasolene tank for every R. & V. Triumph Engine is most conveniently and safely located—on practically all of the stationary engines it is in the sub-base.

Write for free booklet "Letting Gasolene Do It." This book tells how you can save time every day in the week by using an R. & V. Triumph Engine.



John Deere Wheel Plows

With Quick Detachable Shares
Unscrew One Nut—That's All

John Deere Wheel Plows, known the country over as "Quality Plows" are now fitted with John Deere Quick Detachable Shares—an exclusive John Deere feature.

Here are some advantages of these shares:

1. No trouble to change shares.
2. Eighty per cent of time saved.
3. No danger of damaging share.
4. Share is drawn up closer.
5. Share is stronger—not weakened by bolt holes.
6. Resharpened or sprung shares can be drawn into place—no drift punch necessary.
7. No unequal strain on share.
8. No danger of injury to hands in taking share off.

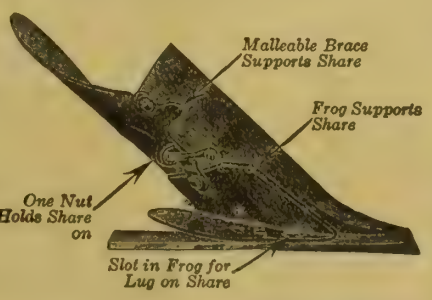
We have beautifully illustrated booklets on the following plows with John Deere Quick Detachable Shares:

New Deere Sulky and Gang (High Lift Frame Plows)

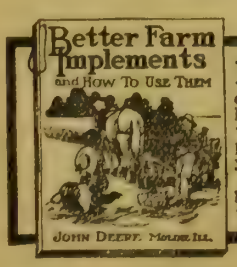
John Deere Stag Sulky and Gang (Low Lift Frameless Plows)

John Deere Two-Way Sulky (Side Hill or Irrigated Land)

John Deere Engine Gangs (For Traction Engines)



Mention the booklet above that you want and we will send it to you free.



Better Farm Implements and How to Use Them

FREE BOOK Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X-111.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

FREE SEEDS

The agricultural committee of the national congress reported unfavorably as to the continuation of the free seed distribution. But this report did not appeal to congress, and the continuance of this most objectionable practice was forced through. It is a petty graft which will some day be wiped out, but it is astonishing the hold it has on the minds of our representatives and senators. The seeds may prove good vote getters but as a rule they are outrageously poor crop producers.

FARM BUREAU

The first annual meeting of the San Diego County farm bureau is to be held within the Panama-California Exposition grounds on Saturday, March 20. The full day's program has been prepared and appears on another page. The San Diego people are fully alive to this matter of getting the benefit from their farm adviser. They have arranged a good program, and every producer in San Diego County will do well to attend his exposition the day of the 20th and listen to the good things which are offered in the farm bureau meeting. There never was an exposition that had a more beautiful setting than that at San Diego. It's worth a trip across the continent.

PARCEL POST INSPECTION

Commissioner Cook writes of his satisfaction in the passage by the national congress of the bill which permits horticultural commissioners to inspect packages of plants, seeds or bulbs coming through the mails. This inspection has been permitted by some postmasters, but as a matter of courtesy rather than a matter of right to the fruit growing interests of the country. Now the inspectors will have authority. This bill has been encouraged by the office of the state horticultural commission and in fact by all who have the best horticultural interests of the country at heart. We hope this bill will prevent the spread of fruit pests.

NATIONAL LIVE STOCK

The American Live Stock Association is extending a general invitation to attend its 18th annual convention which will be held in Hall A of the Exposition Memorial Auditorium in the civic center of San Francisco, March 24-26. There will be morning sessions only; afternoons and evenings will be given up to the exposition. This will be one of the most notable meetings ever held by representative live stock organizations, and prominent stockmen from all states of the West will be there. March 26th has been designated by the exposition officials as live stock day. The president of the association is H. A. Jastro of this state.

POPPIES

More wonderful than ever are the California poppies of 1915. We have been hoping for liberal rains that our visitors during the exposition year might be granted the sight of California poppies at their best. The rains and the poppies have both made good. There is one in this office gathered in fields where no cultivation has been given. It has a wonderful golden sheen and measures six and one-eighth inches from tip to tip. Perhaps if we were compelled to be absolutely correct we should say its measurement is six inches, but for a good story you will pardon us for saying it is six and one-eighth inches. It is one of many gathered at random in the same field and all run very large. In the neighborhood of large towns, the townspeople and the tourists have to a certain extent reduced the number of flowers and acres and acres of the yellow gold are no more, but our state flower is still a wonder and we are all proud of it.

LIVE STOCK AT P. P. I. E.

The foot and mouth disease has proved most embarrassing to Mr. Lively and to all who are interested in producing the greatest exhibit of live stock ever brought together, as was the intention of the management of the Panama-Pacific International Exposition. The outbreak of the disease has prevented the installing of any exhibits as yet, but we are glad to say that a determination exists to gather together such an exhibit and that it will be installed before many weeks. It was recently our pleasure to have a few minutes conversation with Secretary Wm. Caldwell of the American Guernsey Cattle Club. While the quarantine exists as at present, it is impossible for stock to be brought from east of the Rockies, but Mr. Caldwell assures us that so far as Guernsey cattle are concerned there are some exceptionally fine herds in California and other coast states. His mission to the coast is to encourage owners of this stock to exhibit. We have not learned as to whether all arrangements have been completed, but we are glad the Guernsey people are taking this step and hope other associations will see that their breeds are represented.

STATE ASSOCIATION

Perhaps the state in which farmers are best organized is New York. There are several horticultural associations, a general agricultural association, together with many gardeners, florists and other similar societies looking after the interests of their members. One of the most enthusiastic members of several of these associations is Mr. George T. Powell of Ghent, New York. When the matter of a general agricultural association for California was explained to him, he endorsed it and said he felt that with little question such an organization in this state would have a great future. The general agricultural association in New York hardly covers as much ground as is proposed in the California organization. In New York the state agricultural society encourages farmers in making exhibits at the state fair, also at its annual meetings has a fine exhibit. The same is true of both of the large horticultural societies, and in addition they have exhibits at the time of their annual meetings.

There certainly is opportunity for California to take an advanced step which may be an example for every state in the Union. Let it have to do with the scientific side of agriculture, with that which is cultural, and surely with the economic. Let it not take the place of any existing organization, but let it advance the interests of all and encourage greater cooperative effort of every kind on the part of the producer.

"I find the Cultivator very helpful in my work—gardening. I think the Cultivator the most helpful paper in the country and like very much the 'Questions and Answers' department, also 'Poultry for Profit' and especially 'The Lawn and Flower Garden.' I am an Eastern gardener and gardening is so different from the Eastern way (New York) that a private gardener must learn a great deal here in California before he can hold a good responsible position.—W. Andress, El Monte."

NEXT WEEK

Next week's number of the Cultivator will have matter of special interest to citrus growers. We regret that we cannot give any golden rule for securing a reasonable price for the best fruit ever shipped out of the state. The present poor market is due to conditions beyond the realm of the Cultivator or of any cooperative organization or of any nation at this time, and these same conditions are affecting all fruits and nearly all produce. This particular matter of marketing will be discussed by Mr. G. W. Waterbury, though, as we say, perhaps he cannot solve the problem.

We have asked Prof. J. Eliot Coit for an article, and it should be something exceptionally good because, as our readers know, Mr. Coit has just finished writing a book on citrus culture which is now on the press. It is announced that this book will be ready for distribution sometime during this month. In answer to our request for an article Dr. Coit writes, "There has been an article buzzing round inside of me for some days past, and after receiving your request I concluded that now is a good time to get it into shape." We believe that Dr. Coit will give Cultivator readers some of the very best of his thought on "The Value of the Careful Handling of Citrus Fruits."

There will be other articles of special interest, and one of the best features will be the household department in which all things citrus will be considered.

Agricultural Notes

The American Association of Nurserymen will meet in its 40th annual convention at Detroit, Michigan, June 23-25.

The Ottawa, Canada, Household League has opened a depot for the sale of household necessaries at cost of distribution.

The cotton boll worm is causing serious damage to this year's cotton crop in this island of Cyprus in some cases causing a loss of 50 per cent in yield.

The Cuban National Horticultural Society is urging the secretary of agriculture to send experts throughout the groves of Cuba and the Isle of Pines to determine if any citrus canker is present.

Operations in the Canadian beet sugar factories for the 1914 season commenced on October 1, and during the month 12,295,200 pounds of raw beet sugar were made from 48,480 short tons of roots worked.

Our surplus food products cannot go to Europe now because present freight rates are more than five times the normal rate. Normal rates from the Atlantic seaboard to Rotterdam are about $2.50 per ton.

It is reported that the Austrian government has issued a peremptory decree that every land holder sow every available piece of land with spring wheat. Failure to comply is punishable with heavy fines and imprisonment.

Seventy-five carloads of oats intended for export have recently been seized by the federal authoritives because they were found to be adulterated within the meaning of the food and drugs act. The adulteration charged is the addition of feed barley or water or both.

The appropriation of $35,000 to fight the citrus canker in Florida became available January 25 when President Wilson signed the urgent deficiency bill. This amount was incorporated in an item making this sum available upon the bill becoming a law. The danger from citrus canker to the citrus industry of the entire nation was shown conclusively and the item was inserted in the bill without severe opposition.

The department of agriculture on February 15 extended its quarantine regulations against foot and mouth disease to include all territory east of the Mississippi River and north of the state of Tennessee. Shipments from this territory to the south or west cannot be made except of animals to be killed within 48 hours. The state of Rhode Island has ordered the closing of all slaughter houses in the state for an indefinite period.

All classes of live stock in the United States are increasing in numbers for the first time in many years. This is the information sent out by the department of agriculture. Including horses, mules, milch cows, beef cattle, sheep, and swine, there were on January 1, 1915, 7,712,000 more farm animals in the United States than on January 1, 1914. The increase in the total value was $78,024,000, or 1.3 per cent. It is quite true that this increase is not yet proportional to the increase in population, which is approximately two per cent; but the fact that there is an increase, that the tide seems definitely to have turned, is regarded as a sufficient answer to alarming exaggerations and misleading figures.

Agricultural News Notes of the Pacific Coast

Northern California

Sutter County is planting many orchards and vineyards.

Live Oak, Sutter County, observed flower planting day March 5 and 6.

Sutter County will commence its planting of rice within a very short time.

Chico and Gridley, in Butte County, have united in forming a large cow testing association.

Sonoma County farmers are holding mass meetings to discuss legislation of interest to agriculture.

The five northern counties of Shasta, Modoc, Siskiyou, Lassen and Trinity are uniting in a prosperity boost.

The Humboldt County Dairymen's Association met recently at Ferndale and discussed legislative matters.

The cost of horticultural inspection and advisory work in Sacramento County is less than $7,000 per year.

The Soscol, Napa County, farm center recently met and observed a demonstration of methods of combating hog cholera.

The Alameda Sugar Beet Company is making extensive plantings of sugar beets in the neighborhood of Davis, Yolo County.

Napa County farmers appeared before the board of supervisors recently and asked for the appointment of a farm adviser.

The California hop growers have prepared articles of incorporation and steps are being taken to finance a marketing organization.

Cooperative poultrymen in Sonoma County are considering the purchase of car lots of corn and wheat and other poultry supplies.

The Farmers' Club at Ukiah, Mendocino County, is organized to buy supplies for its members. It now has a sinking fund of nearly $8,000.

A half dozen large committees are working for the success of the usual farmers' picnic to be held at the University farm at Davis, April 24.

To satisfy a judgment an irrigation ditch near Placerville, El Dorado County, which cost nearly $3,000,000 was sold under the hammer February 23.

The Alameda Sugar Beet Company in annual meeting reported beets produced in Glenn and Yolo Counties last year aggregated in value nearly $60,000.

The shipments of butter from Humboldt County for the past year aggregated 5,124,000 pounds and brought to the county almost a million and a half dollars.

Sheep buyers are finding difficulty in securing as many sheep as desired, and they are offering $6.50 per head in the neighborhood of Dorris, Siskiyou County.

Professor Horne of the bureau of plant pathology, University of California, has been experimenting with the use of bisulphide of carbon in destroying oak root fungus in an orchard of Napa County.

The Ferndale Cow Testing Association recently met in annual meeting and elected president, Axel Quist; vice-president, Harry Hurlbutt; secretary, treasurer and manager, Bernard Crowley.

Central California

Oakdale, Stanislaus County, is planting rice.

Another suit is on involving the waters of Tule River.

Dinuba, Tulare County, is working for a free produce market.

Hanford is already planning for its next Holstein-Friesian sale.

Pomona Grange of Tulare County meets in Visalia this week.

A herd of 81 steers was recently sold by a Visalia stockman for $5,650.

The grange of Dinuba, Tulare County, is moving for a cooperative cannery.

Producers in Southeastern Tulare County are demanding better county roads.

There are nearly $3,000,000 worth of raisins in the hands of California producers.

Farm Adviser Lyons of San Joaquin County is forming boys of Ripon into farm clubs.

The creamery at Salinas, Monterey County, manufactured 250,000 pounds of butter last year.

The San Joaquin County farm bureau is aiding in the forming of a cow testing association.

Prof. Bioletti recently met with vineyardists of Dinuba and demonstrated vine pruning.

The Porterville Cooperative Cannery shipped over seven cars of canned fruits last week.

The creamery at Exeter reports an increase of 50 per cent in the amount of butter fat delivered.

Atwater, Merced County, is planning for a drainage district which will cover about 30,000 acres.

Santa Clara and Santa Cruz Counties are uniting in a thoroughgoing squirrel eradication campaign.

Clovis, Fresno County, recently held a mass meeting to discuss formation of a cooperative creamery company.

It is estimated that $150,000 will be saved to the fruit growers of the state because of reduction in packing rates.

The California Green Fruit Association has voted a fund of $10,000 to widen the market for fruits produced by members of the association.

Hanford, Kings County, claims that corn will be planted in that section this year so extensively that there will be one field of nearly 30,000 acres.

The California Associated Raisin Company now has an ambition to secure within its control full 100 per cent of all the raisins grown in the state.

An expert on silos has been engaged by lumber companies of Modesto to demonstrate as to silo construction and to give advice on general farm practices.

One of the biggest productive industries of Stanislaus County, is that of beans. It is predicted that this year's planting will be nearly four times that of last year.

Manager Madison of the Associated Raisin Company has submitted his annual report. The report shows 67,000 tons of the present crop have been sold and that there are about 35,000 tons yet on hand.

Southern California

Heber, Imperial County, is already planting watermelon seed.

Santa Ana walnut growers have decided to build a new packing house.

The Western Fruit Jobbers are planning to boost for Orange Day, March 20.

The holdover lima bean crop is larger than any preceding year at this date.

It is said Imperial Valley's plantings of cantaloupes will be greater than ever.

It is estimated there are 100,000 acres in California producing lima beans.

Ventura County's farm adviser attended the state meeting at Berkeley recently.

One rose nurseryman at Hemet recently shipped a carload of roses to St. Louis.

Carpinteria, Santa Barbara County, will plant more lima beans than any preceding year.

The Riverside County Beekeepers' Club held its regular session at Riverside last week.

Saturday, March 20, is Farm Bureau Day at the Panama California Exposition, San Diego.

The farmers' club at Mound, Ventura County, was addressed last week by a real live senator.

Farmers in the Victorville section of San Bernardino County are making many improvements.

The San Diego Floral Society will hold three flower shows during the Panama California Exposition.

Talbert, Orange County, has organized a boosters' association to make known the merits of that section.

The Riverside Fair Association has been planting several hundred eucalyptus and pepper trees on its grounds.

A campaign is being made in Oceanside and Escondido to secure more general planting of canning tomatoes.

Orange County is planting a large number of Cedrus deodara recently received from France along its roadsides.

The watersheds back of San Bernardino are said to have snow anywhere from six to 16 feet deep, and Bear Valley Lake is frozen to a depth of 14 inches.

H. M. Armitage of San Diego County has been appointed county horticultural commissioner to succeed Mr. Weinland, who has become county farm adviser.

Fallbrook, San Diego County, has already received about 20 inches of rainfall. The extreme southern end of the state has done itself proud this year in the matter of precipitation.

San Fernando, Los Angeles County, is planning for the very general observation of Orange Day and will devote the entire week to the celebration and to promoting the plan of "Buy at Home."

A more discouraging situation never faced the citrus growers than at the present time. The war, hard times, immense crops and lines of commerce so clogged as to be unable to deliver fruit are all causes.

The Coast

Chandler, Arizona, has baled over 1800 bales of cotton.

Hop growers of Oregon are planning a state organization.

Western Montana is shipping large quantities of butter to the Eastern markets.

The first shearing in Eastern Oregon took place near the end of February at Pilot Rock.

The supreme court of Washington has decided in a suit that potatoes are a horticultural product.

The Arizona experiment station is calling attention to the need for more hogs to be produced in that state.

The Southwestern New Mexico Cattle Growers' Association will hold its next meeting at Silver City April 2-3.

Farm Adviser Armstrong of Maricopa County has taken up his work in the Salt River Valley section of Arizona.

Cattlemen of Cochise County, Arizona, attended the Pan-Handle Stockman's convention at El Paso last week.

The United States congress has appropriated almost a million dollars for canal extension on lands under the Yuma project.

The Colorado agricultural college is making investigations as to best methods of incubation and general poultry practice.

Glendale, Arizona, claims the record of shipping the greatest number of live stock of any station on the Santa Fe in that state.

The poultry and egg people of Texas have organized a state marketing association in the hope of securing more of the customer's dollars.

Two cars of pure bred Herefords have been received by Maricopa County cattlemen to be used to grade up many of the herds of the county.

Live stock men of Eastern Washington are increasing their holdings in anticipation of a later slump in grain prices when live stock prices will surely advance.

Being unable to make European shipments of Newtown pippins, the Hood River apple growers are putting them into Portland markets and retailing at $1.25 per box.

High grain prices have discouraged many from continuing in the hog business near Pullman, Washington, but others are maintaining that averages will justify continuance.

The Arizona agricultural college has a state club agent engaged in extension service who is visiting schools in various parts of the state urging the formation of canning and other agricultural clubs.

The Arizona honey exchange recently met at Tempe, transacted general business and elected officers for the coming year. The president is J. L. Johnson of Tempe, and the secretary M. G. Frizzelle of the same place.

Live stock men of Washington met in January at Pullman, Washington, and since that time have been busy discussing ways of increasing interest in the live stock industry. A stock show with liberal cash premiums will be held.

SUDAN GRASS CROP ON E. J. COWART FARM, NEAR LUBBOCK, TEX.

Grow your own forage—don't keep on buying it. That's the only way to make your live-stock—whether beef or dairy—pay you the biggest profits. You'll never do it when you have to buy feed to carry them through to pasture time each year. Plant

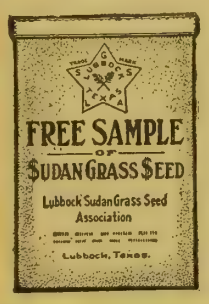
$udan Grass

¶ The wonderful, never-failing, big-yielding forage crop. It will provide hay and ensilage enough to do away with all feed buying at top prices in the spring. Splendid for conditioning animals—work or driving, beef or milk—is rich, succulent, nutritious.

¶ Grows in any soil—thrives in drouth—flourishes under rain. Yields six to ten tons forage to the acre each season, and from 400 to 2000 pounds seed.

¶ Your success with SUDAN GRASS depends upon the seed you buy. Beware of impure, adulterated seed mixtures sold as Sudan Seed. Get the genuine LUBBOCK ASSOCIATION SEED—guaranteed to be absolutely free from Johnson grass and weed pests. Every pound of it certified to by Texas Experiment Station No. 8, situated in Lubbock County. Our warranty protects you in every possible way.

¶ The foremost Government authorities are on record to the effect that Lubbock County, Texas, is one of the best seed-producing centers in the United States. BUY NOW if you want the pure, guaranteed ASSOCIATION SEED. There will be a big shortage before planting time comes.



Put up in 1-2-5-10-25-50 and 100-lb. packages.

STANCHIONS

As there are several of our subscribers who have written asking for best method of arranging stalls, and especially of building stanchions, we quote from a recent circular of the department of agriculture, "Conveniences for Handling the Farm Cow and Her Products."

An improvement in the conditions under which cows are kept on the average farm will greatly lessen the labor required in their care, make it more pleasant, and at the same time cause the cows to produce more milk.

Cow Stall

The cow must be kept in clean, comfortable quarters in order to produce the largest quantity of milk and butter. The essentials of such quarters are: Plenty of light, plenty of fresh air, with no drafts, convenience, a floor that can easily be kept clean.

Figure 1 shows a diagram of a simple and convenient arrangement of cow stalls. The cow stands on the platform (a) with her head through the stanchion (b), which is used to tie her in the stall. The gutter is to catch the droppings and urine, keep them out of the way of the milker, and also to prevent the cow from becoming soiled when lying down. The stanchion shown in figure 2 takes the place of a rope or halter. It is hung in the frame (e) with a few links of a chain at the top and bottom, which allow it to swing and be comfortable for the cow. The stanchion is fastened to the sill, which forms the back of the trough. One side of the stanchion opens on a pivot, closes in a slot, and is held fast by a wire loop or a pin placed in a hole bored through the top of the stanchion and piece that opens. The bottom of the feed trough is two inches higher than the platform upon which the cow stands. The floor of the feed trough and stall should rest flat on the ground. Concrete is preferable for the platform, gutter and feed trough, but sound, smooth boards or plank can be used. A wooden floor must be kept in repair so that liquid will not leak through and puddle underneath and cause bad odors. A leanto can be fitted up with this stall and made a very clean and convenient place to keep cows. Where barn room is scarce, the cows can be kept in these stalls at night and in cold, bad weather with no discomfort to them. When this is done, plenty of bedding, such as straw, leaves, etc., should be put on the floor of the stall.

Calf Stanchion

All calves when a few days old should be taught to drink milk, as this makes their handling less troublesome, and if a clean, warm stall equipped with stanchions for confining them while eating is provided, their feeding will be no more trouble than feeding pigs. Figure 3 shows how these stanchions are made. A circular on the subject of feeding calves can be obtained by writing to the dairy division, bureau of animal industry, department of agriculture, Washington, D. C.

KEEP SHEEP FROM THE "DEATH CAMAS"

Keep your sheep from the death camas (zygadenus), says the United states department of agriculture to ranchmen. Cattle and horses should also be kept from this herb, although actual fatalities from the poisoning are almost entirely confined to sheep. Nausea, muscular weakness and coma are some of the principal symptoms of the poisoning. There is no satisfactory medical remedy, but affected live stock, if kept quiet for some time, will often recover.

The death camas (zygadenus) is most dangerous early in the season, not because the plant is more poisonous at that time, but because it is more likely to be eaten at that time when other forage is dry. Later, sheep are less likely to eat a large quantity, because of the greater abundance of other food. As a matter of fact, most of the cases of extensive poisoning have occurred before the flowering of the plant, which occurs in the late spring.

It is impossible to make even an approximate estimate of the losses of sheep because of the zygadenus, but it is certain that they are very heavy. Investigations have led specialists to believe that many of the losses in Oregon, Utah and California, which were ascribed to other poisonous plants were really caused by the death camas, and without doubt this plant is one of the sources of the greatest losses to sheep owners in Wyoming and Montana. It is said in 1909 in one county in Wyoming 20,000 sheep died because of the zygadenus.

Description of the Death Camas

The death camas may be recognized by noticing its leaves which are grass like, long, narrow and

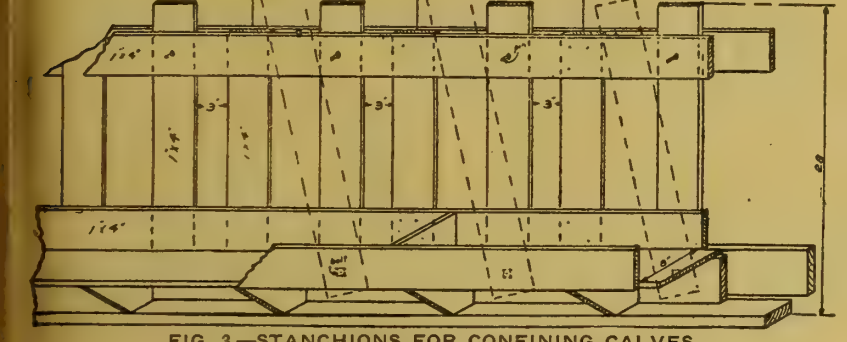

FIG. 3.—STANCHIONS FOR CONFINING CALVES

haped as though they had a keel. They grow from a bulb. The flowers are greenish-yellow or white. The plants are perennial, blossoming n the late spring or early summer nd then disappearing.

This poisonous herb occurs abundantly in the mountain regions of the North, and although found very widely throughout the United States, it s only in the Western region that it as become of sufficient importance o be noticed. The plant is sometimes called wild onion; other names pplied to it are the soap plant, alkali grass, squirrel food, mystery rass and poison sego.

There have been cases of human oisoning as well as stock poisoning s the result of eating the deadly erb. Most of the cases have been hildren who found the bulbs attractive and have collected them instead f the edible camas. There have een a number of fatalities, although ost cases recover.

A new bulletin of the United States epartment of agriculture (No. 125) ives a more particular description f this plant with illustrations which ill be of interest on Western stock anges, although it has been written ore particularly as a professional aper giving an account of the various remedies for the poison, which ave been tried.

ROTECTION OF WOUNDS OF ANIMALS AGAINST FLIES

When an animal is wounded it is important to treat the wound in such way as not to prevent its healing nd yet to prevent screw worms and ouse flies from attacking the open urface, laying eggs or carrying infecon to the animal.

The screw w rm particularly deposits eggs in wounds, and there are other flies that may deposit their eggs in this way. The larvae or maggots hatching from these eggs infest the wound and burrow more or less extensively in the surrounding tissues so that serious damage may result.

The house fly alights on wounds to suck up the exudate and is a cause of considerable annoyance to animals. It prevents wounds from healing and may introduce agents of infection which adhere to its body.

The department in a bulletin on repellents for protecting animals from the attacks of flies, quotes the following formulas for application to wounds.

Formula No. 1—Oil of tar, 8 ounces; cottonseed oil to make 32 ounces.

Formula No. 2—Powdered naphthalin, 2 ounces; hydrous wool fat, 14 ounces; mix into an ointment.

Formula No. 3—Coal tar, 12 ounces; carbon disulphid, 4 ounces; mix, keep in a well-stoppered bottle and apply with a brush.

Mixtures Nos. 2 and 3 are said to adhere to moist surfaces, and No. 3 in said in addition to form a coating over raw surfaces and protect from the screw worm fly.

The editor at the close of the article in which the above formulas are given adds the following formula: Oil of turpentine, 1 dram; phenol, 1 dram; cottonseed oil, to make 4 ounces; mix and apply freely to wounds.

It is stated that this remedy is highly effective and is used widely in the South. It is said to induce healthy granulation of wounds.

FEEDING MOLASSES

The value of molasses as a stock food is not as well understood as it should be. Experiments made in various states show that in a great many instances this feed might be used by the average farmer with profit.

The real feeding value of molasses lies in the amount of sugar it contains, but at the same time it is a splendid appetizer and frequently makes poor hay and other feeds more palatable. It can be fed to all classes of live stock but is probably more suitable for horses and fattening cattle. In the South horses and mules have long been fed on molasses. A government bulletin states that in Louisiana the general custom is to feed the molasses from a large trough, allowing the mules to eat all they wish. It is said they will eat from eight to twelve pounds per head daily. In other places the molasses is diluted with water and sprinkled over chopped hay that is fed to horses.

Perhaps the Texas experiment station has investigated the value of molasses for fattening steers more thoroughly than any other state. In one experiment with feeding yearling steers when molasses was added to a rotation consisting of cottonseed meal and hulls it resulted in a greater and cheaper gain, the steers receiving it gaining 3.11 pounds daily, while those not receiving it gained 2.59 pounds. These results were verified in later experiments.

An investigation made at the Maryland station showed that when molasses was diluted with an equal weight of water and sprinkled over the feed given to cattle the digestibility of both hay and grains was increased. The station authorities say: "These results show that the addition of molasses to a ration has a tendency to increase the digestibility of both hay and grain feeds. This coupled with the generally observed fact that molasses contributes toward making feeds more palatable and also acts as

730 times
every year you use a
Cream Separator

NO other machine or implement used on the farm receives anywhere near such constant use, nor is there any other farm machine or equipment with which quality of work means so much and first cost means so little.

If the separator runs hard, gets out of order or isn't easy to wash, it's a constant bother, and it only takes a very little loss of cream at each separation, when multiplied 730 times, to run into a good deal of money, very soon more than the original cost of the machine. But no matter how small the loss, it is too big a handicap for any cow owner to try to work with.

As a matter of fact, the men who know most about cream separators, the creamerymen, long ago came to the conclusion that the De Laval was the only machine they could afford to use. That's why 98 per cent of the cream separators used in Creameries and milk plants the world over are De Lavals.

All the more reason
why you should buy a
DE LAVAL

No matter where you go you will find the biggest and best dairymen almost invariably are De Laval users. Experience has taught them that it is the best and most economical cream separator.

You don't have to experiment with cream separators any more because the men who are best able to judge as to the merits of the cream separator have already done that for you, and the result of their conclusion is evidenced by the practically exclusive use of the De Laval in creameries and milk plants and the fact that over 1,750,000 farm and dairy size De Lavals—more than all other makes combined—are in daily use.

The nearest De Laval agent will be glad to set up a machine for you and arrange for payment of same as is most convenient. If you don't know the local De Laval agent, simply address the nearest main office as given below.

an appetizer gives molasses a relatively high place as a stock food and makes it more valuable than its analysis alone would indicate."

We bring up this subject at this time because, as we said in the beginning, we do not believe farmers understand the real value of molasses and molasses feeds. We do not advise that every farmer rush off and buy a barrel of molasses or a ton of molasses feed but we do suggest that it might be to his advantage to investigate the matter a little further and perhaps make a trial of this class of feeding stuffs. Personal experience is more convincing than anything we might say.—Farmer's Guide.

The United States Live Stock Sanitary Association announces that its 18th annual meeting at Chicago will be the most important live stock meeting of the year. The regular sessions will be thrown open so that farmers and stockmen interested in control and eradication of foot and mouth disease may have every facility for hearing this matter thoroughly discussed by federal and state officials.

It is not enough that the dairy herd as a whole is paying a profit; each cow in the herd should be contributing her share toward the total profit. In a profitable herd some cows may be good enough to pay their own board bill and that of two or three unprofitable cows as well. Test your cows.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Bleeding from Ear

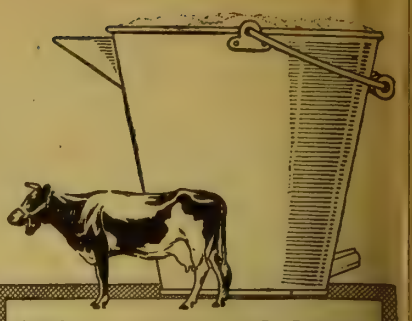
I have a fine Angora cat, about two and one-half years old, and for about a year have noticed an occasional bleeding from the right ear. Lately it has become more frequent. There seems to be no pus and no odor. The cat seems to be perfectly healthy in every other way and is not deaf. What is the cause, and is there a cure?—Subscriber, San Bernardino.

It may be caused by a small wart or a spot of eczema. If you can reach the spot where the blood starts apply a few drops of adrenaline. This will do no harm if dropped into the ear and allowed to run back as far as it will.

Bloating

Would like to have you recommend a remedy to me for cattle that are inclined to bloat.—Subscriber, Holtville.

Bloating is usually caused by feeding on pasture in the morning when the dew is still on the grass or in the afternoon, when the grass is hot from the sun. These conditions cause indigestion, which forms the gas. Cattle usually eat too much anyway, and if allowed to be in pasture for two or three hours after the dew is off, a short time again in the evening, allowing the rest of the time for ruminating, they would get enough to eat and would be less liable to bloat. The best remedy for bloating is a pint of raw linseed oil, with two ounces of turpentine in it. If necessary repeat the dose in an hour or two. Also tie a large hay rope in the mouth. This will act as a gag and they will belch up the gas. In case of extreme bloating it may be necessary to puncture the side and let the gas escape that way. This must be done on the left side at the highest point. Use a trocar and canula, or if that cannot be had use a common knife. Plunge it in and turn it a quarter way around. In extreme cases you must act quickly, as they do not last long.



The Size of Her Yearly Milk Pail

Many cows are really capable of a greatly increased milk yield but do not do their best through a chronic sluggishness of the digestive organs. Such cows need a medicine—just as human beings occasionally need medicines.

KOW-KURE is a scientific cow medicine, which has a direct and lasting tonic effect on the organs of digestion. For over twenty years it has been the standard medicine for the prevention and treatment of such common cow ailments as Abortion, Retained Afterbirth, Barrenness, Milk Fever, Scouring, and Lost Appetite.

You cannot afford to let a cow get down in health. Better keep KOW-KURE constantly on hand. Sold by feed dealers and druggists, in 50c and $1.00 packages.

Our valuable treatise on cow diseases—"The Cow Doctor" is yours for the asking.

Section Line Across Railroad

Have a section line for my north boundary, county line just west of the house. The county line intersects the railroad about the same distance from the building that the section line does. The superintendent promised me a crossing at one time. Now he refuses. Does or does not the state road law compel railroads to open up section lines and county lines over their tracks? I need the crossing badly; as it now is I have to go around two miles and pass over other property—Subscriber, Thalheim.

According to the United States land laws there is at present reserved along section lines a space for roads. The property of which you speak, however, was undoubtedly originally granted to the railroad. The state railroad commission at the present time has entire jurisdiction over crossings over railroads and the railroad would be subject to their order.

Payment Questioned

A leases land from B, paying the rent on the first of each month. According to B's books at the end of the year it appears that A has not paid his rent for the month of June. A's books show that he has. B was not in the city when A claims that he paid. A has no receipt for the money. Can B proceed to collect the rent for June?—Subscriber, Nestor.

The book entry is not as good as a man's sworn statement, and it is a pure question of fact whether he has paid or not.

Witnessing Will

In regard to witnessing a will as referred to in the issue of the California Cultivator of February 18, is your reply applicable only to a citizen of the United States, or to any other nationality? I am a British subject.—Subscriber, Los Angeles.

If the requirements for the execution of a will are met, no matter where the will was executed or by whom, it may be probated within this state and may pass property within this state. If the will is not executed in accordance with the laws of this state, even though valid where executed, it cannot be admitted to probate, nor can it pass title to real property within this state. The same is true of other states and countries. No question of citizenship arises.

Determining Line

A and B own adjoining lands. A survey has been made, the line of which is, however, disputed. A proposes a new survey but B refuses. Can A, should he employ a competent surveyor, enforce the survey of such surveyor?—Subscriber, Valley Center.

The only method in which you can procure a legal enforcement of your survey would be by bringing action to have the line determined and procure an order appointing a surveyor to make the survey. If you have judgment in such action you could recover the cost of the survey. If the line adjudged was the original line of your opponent you would of course lose.

Umatilla County, Oregon, reports material reduction in the number of swine in that county.

KNOW THE TREES

(Continued from Page 299)

ture of both sections of the tree tribe or in muddy or cool localities, all deciduous, or dropping their leaves in winter. Do not quarrel over what you should plant, but plant some kind of tree in uniform kind and ranks. Better spend your money in roadside embellishment of a permanent nature, as exemplified in trees than ten times that amount in gas-pipe fence panels, as one county has done. Use available funds economically and for permanent beauty and utility.

Carob or St. John's Bread

Ceratonia Siliqua, the carob, is going to be more widely planted in future, not only in parks and gardens, but on streets and highways; perhaps in orchards as an economic asset. Since the cold snap of January, 1913 I have been looking them up and find very few were injured by cold anywhere in California and as for climatic range they thrive from here down through Mexico, Central and South America, to where they again meet heavy frosts in the south temperate zone. They are a handsome, sturdy, hardy tree, splendidly adapted to dry soils yet responding promptly and satisfactorily to good care and culture.

A Fine Evergreen Shrub

A few days ago a ranch owner asked me to name an evergreen shrub of rapid growth that would stand harsh treatment or neglect and still remain a healthy green, spreading its generous mantle over the naked earth to hide its bareness, though never a flower was produced.

Looks like a hard nut to crack, but it isn't. Leptospermum laevigatum will do and will please you well if you don't mind the name. It is closely allied to the eucalyptus, though from its splendid spreading habit and small dark-green leaves you would not suspect it. But the blossoms quite strongly resemble those of the common blue gum, and this shrub will rival the eucalypts in growth where soil and water both are in scanty supply. For shrubby masses in any and all soils and under many varying conditions it has very few rivals and no superiors. Its value is rapidly becoming a matter of common knowledge and each succeeding year witnesses a heavier demand for it for general planting, in mass, or singly, in park, garden or for wild hillside cover.

Plant Rocky Hillsides

In all parts of California, yet more marked in the south, are countless square miles of barren, rocky hillsides, unrelieved by any plant of fine dark green or of any impressive size. Just a few good pines to the acre would change this aspect most pleasingly and effectively. It is not necessary to have forests. Plant a few, sparsely; the general effect will satisfy, and each year you may add a few more small trees. Pines are the better trees for this purpose. Use Mugho, Jack, Canary Island, Aleppo, or even the native Monterey. All are good, fairly drouth resistant, and will soon work a wonderfully satisfying effect on the general landscape and add to all surrounding land values.

Plant Now

During the next 30 days should be planted nearly everything to go into the garden this spring. Trees, shrubs, vines, bedding plants, bulbs, all living vegetable things that inhabit the earth are ready to respond to the call of nature at this time, and some of them are lessened in value and vigor by longer retention from the soil-mother, whence new growth will be found quickly responsive. Heed the dictates of nature at this time and "get a move on" you.

FARMERS' INSTITUTES

A farmers' institute is announced for Alpaugh, Tulare County, on March 19.

The only other institute arranged for this season is to be at Arroyo Grande on April 13 and 14. This will probably close the institute work for this season.

Cotton seed oil production in the United States is now over 200,000,000 gallons annually, or five times as much as in 1890.

Quality. Compare Prices

The Goodrich Tire, like the trained athlete, is all brawn and muscle —no fat

THE old Olympic Game promotors were great for what we call "form."

Symmetry, proportion, soundness and proper balance out-bid bulging muscles for favor—yes, and out-won, too, just as they will today.

Mere bulk never was synonymous with endurance—and the truth of this statement drives home with a bang, when you apply it to tires.

IF thick, heavy tires were the last word in tire construction, we could wipe out of existence a Goodrich Research and Test Department employing seventy people. We would take off the road a battalion of ten automobiles, that run twenty-four hours a day and every day in the year, grinding tires of all makes to pieces, just for the sake of information to us and eventual economy to the user of Goodrich Tires.

There is where we learn to cut out of a tire the material which gets the user nothing.

Of course, when we stripped tire price lists of their padding—fictitious values—we *expected* rivals to say we had stripped our tires.

IT was their only "come-back." They *had* to say that, in stripping down prices to the point where they were *fair* to dealer and consumer and left no room for injurious price-cutting tactics, we had stripped our tires of some quality, too.

THE Goodrich Tire, like the trained athlete, is all brawn and muscle—no fat. It represents an achievement—the ability to cut out the extra costs of manufacture, the extra costs of labor, of extra, needless material, and to give you the best, long-mileage, high-standard tire in the world.

There are padded tires as well as padded price lists.

Don't pay for padding.

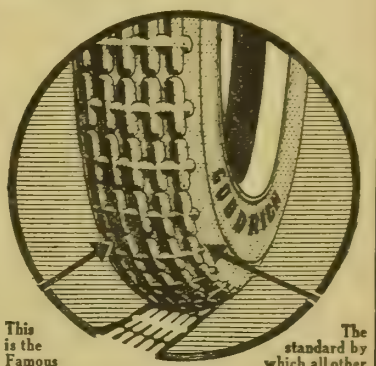
Now don't forget this—we are talking in the main about Goodrich Safety Tread Tires, for they represent ninety per cent of our factory output for resale.

Furthermore, while we have put the padded prices on smooth tread tires on the run, the evil of padded prices on non-skid tires still is in evidence, as shown in table below:

Note the following table of comparative prices on non-skid tires. Columns headed "A," "B," "C" and "D" represent four highly-advertised tires:

Size	Goodrich Safety Tread	OTHER MAKES "A"	"B"	"C"	"D"
30x3	$ 9.45	$10.55	$10.95	$16.35	$18.10
30x3½	12.20	13.35	14.20	21.70	23.60
32x3½	14.00	15.40	16.30	22.85	25.30
34x4	20.35	22.30	23.80	31.15	33.55
36x4½	28.70	32.15	33.60	41.85	41.40
37x5	33.90	39.80	41.80	49.85	52.05

If you are charged less for any other make than Goodrich, they are taking it out of the tire; if you are charged more, they are taking it out of you.



This is the Famous Goodrich Safety Tread

The standard by which all other non-skids are judged

Poultry for Profit

A CHEAP BUT ADEQUATE BROODER

Written for California Cultivator
By Mrs. R. C. Hutchinson

BEFORE we constructed our present brooder system we had tried the fireless brooder and the hot water brooder. While either of these might be used with success in some climates and by persons exercising judgment and discrimination, I think that in a locality where the nights are chilly and especially where there is a sudden chill in the air towards morning such brooders are too uncertain. From our experience I am rather inclined to say that the loss of young chicks in these brooders is the only certain feature about their use. The trouble seems to be that the chicks get overheated in the hot water brooder and in the fireless brooder crowd together too closely in order to keep warm. The result in either case is the same. The chicks come out of the brooders in the morning damp, overwarm, perspiring through every pore; the cold air chills them and they stand about and shiver, singly or huddled together. The more vigorous chicks are the sole survivors though I should add that we have lost many of the strongest chicks in the fireless brooders through their forcing themselves under the others and thus being smothered.

We have come to these two conclusions: That heat is almost the most necessary factor in the development of the baby chick and that the chick, like a human being, cannot be comfortable unless its feet are warm. On this last principle we have constructed our brooder. My husband calls it "putting a hot brick to their toes."

We began by taking out the wooden floor of our brooder house. We then excavated a trench about two-thirds of the distance across the floor of the house and in this we laid terra cotta sewer pipe 16 inches in diameter. We let this pipe extend for about a foot beyond the outside wall of the house and dug a pit outside to leave room enough for putting fuel into the terra cotta pipe, which was to serve as the stove. The outer opening we closed with a sheet of iron which answered the purpose of a damper as well. Where the pipe left off, about two-thirds of the way across the house inside, we laid sections of five-inch stovepipe (terra cotta would be better) in a shallow trench and let this pipe extend about nine inches beyond the outer wall of the house, joining it by means of an elbow to a vertical piece of stovepipe provided with a damper and extending above the roof of the house to carry off the smoke. We then covered the floor of the brooder house with sand to the depth of four inches, making a solid floor of sand likewise over the sewer pipe and the stovepipe connected with it. We made a board hover two feet wide and eight feet in length. Along the long sides we tacked strips of heavy material, slit every two inches, to hang down over the edges of the board as a curtain. The board was then placed on cross pieces which held it four inches above the sand which overlaid the pipe. When a fire had been made in the large pipe and the sand had become warm we carried out the chicks from the incubator and put them on the warm sand under the hover.

It remains simply to say that we lost hardly a chick thereafter. When the little things felt cold they would run in under the hover. At night it was a pretty sight to see these chicken babies stretched out in the warm sand near the hover, each one apart from the others and each one thoroughly comfortable.

The fire was usually made about four o'clock in the afternoon. The drafts were closed as soon as the fire was burning well and it smouldered all night, keeping the sand warm until well into the next day.

We used heat for a longer or shorter time, according to the season. It was necessary later to teach the chicks to roost and we set up roosts for them in the brooder house, putting the little birds up on them until they got into the roosting habit and were large enough to be transferred to a colony house in the field.

HOW TO RAISE LAYERS

The first essential is good stock. Get the breed that you like from a reliable breeder and stick to it. I tried keeping several different kinds at one time, but I sold all but one breed and had much better success. When good stock has been selected, build good houses to put it in. Don't overcrowd the chickens.

Hatch the chicks early. I would give more for one early hatched chick than for a dozen hatched late. It is the early pullet that begins to lay in the fall and winter when eggs are high. That is where the profit is. Those hatched late loaf all winter and start laying in the spring when eggs are cheap. Don't depend on the old hens to hatch the chicks; they are not to be depended upon to set early and there are plenty of good incubators on the market. Any person with good common sense can run an incubator successfully.

A great many persons complain that incubator chicks are hard to raise. If they are hatched properly they will grow as vigorously as the hen-hatched chicks. Chilling in the incubator is one of the greatest causes of the death of chicks. Don't let them drop while they are hatching, from the egg tray into a cold nursery tray underneath. I learned this from costly experience. I was running a number of incubators of different makes and found that from some which hatched the largest number of the chicks the chicks were the hardest to make live.

This was due I found after many experiments to the space around the egg tray which allowed the chicks to drop over into the colder nursery tray. Those that dropped over while yet wet were the ones that died. After that I made a change so they did not get off the egg tray, and I have had but slight loss of chicks since. If they become too crowded in hatching I open the machine quickly and remove some of the chicks to a warm basket. When the hatch is complete and the chicks are dry, remove them to a warm brooder. Be sure they are kept dry. Another source of loss of chicks is damp brooders.

For the first few weeks I give bread crumbs moistened with sweet milk and a small amount of hard-boiled egg. Take the chill from the water which should be kept before them. After the first feed give them some good chick feed and a small amount of commercial beef scrap, increasing it as they grow older and gradually changing from chick feed to whole grain. Keep dry bran before them all the time.

When they are old enough, probably about seven or eight weeks old depending on the growth of the chicks, remove them to good movable colony houses. If there are stubble fields near they will only need feed once a day, and that at night. These colony houses should be moved occasionally to new ground. Leave the chicks in these houses until fall and put them from there into laying houses.

If chicks thus raised are well fed through the winter they will lay and will be as profitable as any stock on the farm.—Nebraska Farmer.

White Diarrhoea

The proper treatment of this and other poultry diseases is fully explained in a new booklet, "The Care and Feeding of Poultry," written by an experienced poultryman. This booklet, together with a sample of Chictone, is free for the asking. Address The Wight Co., A-91, Lamoni, Iowa.

DON'T SELL EGGS FROM INCUBATORS

A number of poultry raisers, it seems, are putting on the market infertile eggs that have been tested in incubators from three days to a week. As soon as the breeder finds that the eggs will not hatch he takes them out and sends them to market along with his fresh spring eggs. After the eggs have been in the incubator for this period they are distinctly stale and rot very quickly if kept any length of time. Even when just taken from the incubator these infertile eggs are not fit for boiling or poaching, although they may be used for frying, and are good for cake or certain other baked goods. These eggs when they reach the market, however, are classified as low grade No. 2.

The mixing of incubator eggs with the fresh spring eggs leads the egg packers, who get their principal cold storage supply in spring, to cut the price they pay the farmer, department of agriculture investigators find. The spring eggs designed for keeping for winter consumption must be absolutely good. Moreover, the egg packers in the spring do not candle eggs but hold them three at a time in the hand and clink them to discover any crack and then judge their freshness by their fresh powdery look on the shell. The mixture of infertile incubator eggs with fresh eggs interferes seriously with this clinking and forces the packer to candle the eggs. He then deducts this added expense from the price he offers to the producer. Eggs which have once been subjected to the heat of the incubator cannot be stored, even though frozen.

The farmer who sells incubator eggs to the dealer, therefore, is very liable to injure his own market for fresh eggs. When dealers find a percentage of low grade incubator or other eggs in their fresh spring supply they lower the price for all eggs so that they will be certain that they have covered themselvs against losses from this cause. The department's specialists advise farmers to use any infertile eggs they may take from their incubators for home consumption and to send only fresh eggs to market.

WHITEWASH

Whitewash is the cheapest of all paints and for certain purposes it is the best according to Farmers' Bulletin 474. Lime, which is the basis of whitewash, makes a very sanitary coating and is probably to be preferred for cellars and the interior of stables and other outbuildings. The following directions for making whitewash are taken from "White Paints and Painting Materials," by W. G. Scott:

Ordinary Whitewash

This is made by slaking about ten pounds of quicklime with two gallons of water.

The lime is placed in a pail and the water poured over it, after which the pail is covered with an old piece of carpet or cloth and allowed to stand for about an hour. With an insufficient amount of water, the lime is "scorched" and not all converted into hydrate; on the other hand, too much water retards the slaking by lowering the heat.

"Scorched" lime is generally lumpy and transparent, hence the use of the proper amount of water for slaking and an after addition of water to bring it to a brush consistency.

Factory Whitewash

Interior: For walls, ceilings, posts, etc.

(1) Sixty-two pounds (1 bushel) quicklime, slake with 15 gallons water. Keep barrel covered until steam ceases to rise. Stir occasionally to prevent scorching.

(2) Two and one-half pounds rye flour, beat up in one-half gallon of cold water, then add two gallons of boiling water.

(3) Two and one-half pounds common rock salt, dissolve in two and one-half gallons of hot water.

Mix (2) and (3), then pour into (1) and stir until all is well mixed.

This is the whitewash used in the large implement factories and recommended by the insurance companies. The above formula gives a product of perfect brush consistency.

Weatherproof Whitewash

Exterior: For buildings; fences, etc.

(1) Sixty-two pounds (1 bushel) quicklime, slake with 12 gallons of hot water.

(2) Two pounds common table salt, one pound sulphate of zinc, dissolved in two gallons of boiling water.

(3) Two gallons skimmed milk.

Pour (2) into (1), then add the milk (3) and mix thoroughly.

Lighthouse Whitewash

(1) Sixty-two pounds (1 bushel) quicklime, slake with 12 gallons of hot water.

(2) Twelve pounds rock salt, dissolve in six gallons of boiling water.

(3) Six pounds Portland cement.

Pour (2) into (1) and then add (3).

Note: Alum added to a lime whitewash prevents it rubbing off. An ounce to the gallon is sufficient.

Flour paste answers the same purpose, but needs zinc sulphate as a preservative.

Molasses renders the lime more soluble and causes it to penetrate the wood or plaster surface; a pint of molasses to five gallons of whitewash is sufficient.

Silicate of soda solution (about 35 degrees Baume) in the proportion of one to ten of whitewash produces a fireproof cement.

A pound of cheap bar soap dissolved in a gallon of boiling water and added to about five gallons of thick whitewash will give it a gloss like oil paint.

An old receipt for whitewash, issued by the lighthouse board of the treasury department, said to be very good for outdoor exposure, is as follows:

Slake half a bushel of unslaked lime with boiling water, keeping it covered during the process. Strain it and add a peck of salt, dissolve in warm water; three pounds of ground rice put in boiling water and boiled to a thin paste; half a pound of powdered Spanish whiting and a pound of clear glue, dissolved in warm water; mix these well together and let the mixture stand for several days. Keep the wash thus prepared in a kettle or portable furnace; and when used, put it on as hot as possible, with painters' or whitewash brushes.

The washes which contain milk, flour, or glue are not to be advised for use in damp, interior places, owing to danger of decomposition of the organic matter. For such locations it is better to use one of the formulae containing none of the ingredients. Whitewash is applied with a broad whitewash brush and is spread lightly over the surface, no attempt being made to brush it in as in the case with an oil paint.

A good whitewash recommended by Dr. Coit for young trees, or where they have been heavily pruned is what is commonly known as California tree whitewash:

Quicklime	30 pounds
Tallow	4 pounds
Salt	5 pounds

Water enough to make the mixture flow freely.

POULTRY CLASSES

The poultry which has been admitted to the standard of perfection is classified by breeds and varieties. The general purpose breeds, that is, the breeds which are good layers, and also furnish a good table fowl, are classed to themselves; the breeds which are grown specially for eggs without regard to table qualities, to themselves, and those breeds which are largely used for roasters form a class, as well as numerous other classifications and divisions. The first four classes furnish the bulk of the poultry and are counted the most popular; the entire classification as given in the standard of perfection is as follows:

Class 1, American—Made up of Plymouth Rocks, all varieties; Wyandottes, all varieties; Javas, Dominiques, Rhode Island Reds and Buckeyes.

Class 2, Asiatic—Comprises Brahmas, Cochins and Langshans, in all varieties.

Class 3, Mediterranean—Consists of

(Continued on Page 311)

Tells why chicks die

E. J. Reefer, the poultry expert of 805 Main St., Kansas City, Mo., is giving away free a valuable book entitled "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

Lousy Poultry Can't Pay

Lice-infested poultry are a constant loss to the poultryman. Lice suck the rich lifeblood from poultry, stunt the growth of young chicks and rob you of your well earned dollars. These pests reduce the hens' laying ability. Buy an effective louse killer and use it liberally.

DR. HESS
INSTANT LOUSE KILLER

Kills Lice Instantly. Sprinkle it thoroughly on lousy hens, rub it well under the wings and neck, put it in the dust bath, in the nests, roosts and cracks. Instant Louse Killer also kills lice on farm stock, bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes. Comes in handy sifting-top cans.

West of Rockies: 1 lb. 25c; 3 lbs. 60c.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Planting Walnuts

Wish to plant walnuts 20 miles east of Oceanside on the San Luis Rey River, elevation of 280 feet. Water seven to eight feet below surface. Soil sandy loam. What variety would you advise planting? What root should they be budded on and when should they be planted?—Subscriber, Bonsall.

If the water is standing in the soil not closer to the surface than seven to eight feet with the rainfall we have had this winter it is perfectly safe to plant walnut trees in the location described. Damage from water in the soil is caused by the roots following the receding water level and then the water level rising to within three or four feet of the surface. A very small percentage of the roots will go as deep as seven feet so there will be no damage noticeable if a few roots are lost at this depth. Neff's Prolific walnut has been the best producer for me and has characteristics which make it very valuable in the southern part of the state. The best root on which to graft has been the native black walnut and we know of nothing better now.

The planting should be done in January and February, if possible, but since the weather has been cool planting can be successfully done later this spring, but all planting should be done before buds swell or the new root hairs form. This will not likely take place before March 15 this year. The young trees should have the soil well settled around them either by pouring on water enough to fill the hole after the soil has been put in place or by running a stream along the row.

See the article on Planting a Walnut Orchard in the February 11, 1915, number of the Cultivator.—J. B. N.

Bloody Eggs

What is the cause of bloody eggs?—Subscriber, Ontario:

Blood spots in the yolk or white of the egg or blood streaks on the shell are due to the rupture of a minute blood vessel, caused by the hen straining when she lays the egg. Pullets laying their first eggs, and hens that are too fat are more likely than others to have this trouble, but it seems probable that a tendency to it is inherited. That is to say, the thinner the membranes of the oviduct the more likely will a hen be to rupture them, especially when she is laying well. If such a hen is used as a breeder the chances are that her daughters and granddaughters will have the same thinness of membrane with tendency to rupture. It would be a good plan to find out, if possible, which hens lay these bloody eggs, and to keep them out of the breeding pen. A tiny blood spot does not injure the egg, but a condition such as you describe makes it unmarketable, and should be avoided by careful selection of breeders.—J. A. K.

Lime Sulphur Wash

Is crude oil spray as good as lime sulphur for scale, etc.? Which is best, lime sulphur boiled in the regular way or self-boiled? Do you recommend commercial lime sulphur solution?—Subscriber, Gardena.

The answer to the first question depends on what is covered by "etc." For scale alone crude oil emulsion gives very good results but it has no beneficial effects on fungous diseases, of which there are many affecting our deciduous orchards. The lime sulphur, while not as good a fungicide as is Bordeaux mixture, is effective with many fungous troubles and also one of our best insect destroyers. Many of our largest orchardists are now using the commercial lime sulphur solution, applying while trees are dormant at the rate of about one to 11. The self-boiled has given fairly good results but not equal to the regular made lime sulphur solution.

Tomato Wilt

Is there any way of treating the seed or dipping the small plants before planting to prevent tomato wilt or to help control the disease? This trouble was prevalent in this section last year and as we are planning to plant again this year would like to know method of prevention or control of the disease.—Subscriber, Ontario.

There are two kinds of tomato wilt. The so-called summer wilt is caused by a fusarium. Once it has secured entrance to the tissue of the plants it is incurable. The only way to prevent this disease is to plant disease-free seed on disease-free soil, both as to seedbed and field. For instance if the fusarium existed in the plant grown last year some other location must be selected this year. If, however, the trouble was caused by th

fall wilt it is of a fungous nature and affects the plants usually after the rains or during the moist weather. Spraying with Bordeaux will cure or prevent this condition.

Preserving Fence Posts

How may I treat eucalyptus fence posts so that they will last?—Subscriber, Watsonville.

Hot creosote is the best treatment. Heated oil, either linseed, which is expensive, or ordinary crude oil only is fairly satisfactory. Where creosote is used it is ordinarily put in an open topped tank and the temperature raised so that the liquid will penetrate the wood. Cold creosote is effective for a short time but does not penetrate the wood as thoroughly as does the heated solution. The most economical way of handling posts where there are only a few to be treated is to remove with cold chisel one end of an ordinary 50 or 60-gallon gasoline tank. In this the solution is placed and after the fire has raised it to the proper temperature the thoroughly seasoned eucalyptus posts are stood in it and allowed to remain some hours. There is no material gain in treating green eucalyptus posts. They are so full of sap that there is no opportunity for the creosote to penetrate.

Moving Stumps

How may I take out eucalyptus stumps? Some were recently cut, others are old.—Subscriber, Watsonville.

If by old ones you mean those which are dead and dried to a certain extent presume the char pit method used so extensively in Oregon would work. An excavation is made at one side sufficient to place in a quantity of wood or other fuel, the stump is burned until alive with coals, then the fire is partially covered when it will consume the entire stump, it is claimed by some to the tips of the larger roots. Some bore several holes in the top of the stump and fill with coal oil and fire in this way.

Turkeys

Is it necessary to keep gobblers with turkey hens all the time to have eggs fertile? Some tell me one service is sufficient for the season, others say only for one clutch of eggs.—Subscriber, Santa Ana.

Experts are pretty well agreed that the hen turkey allows the male to tread but once in a season, nevertheless some of them strongly advise not only the keeping of the male with the hens all the time, but the use of two males in alternation. The reasons for this are that a hen will sometimes refuse to mate at all with a given tom, so that unless another male is used her eggs will all be infertile, and that at times when a hen has been served by the tom the eggs are not properly fertilized. If one could be sure that every hen in the flock mated with the tom within a given time and that the eggs in every case had been fertilized, it would be safe to remove the tom from the flock. As it is, one is always kept, and often two, though the two are never allowed to run with the hens at the same time.—J. A. K.

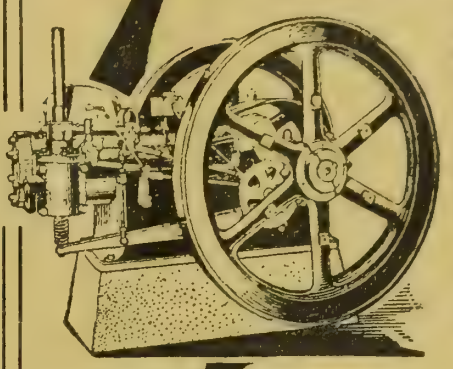
Lice on Hogs

My hogs are covered with lice. What is the best remedy? I have no tank. How are the tanks built and how used?—Subscriber, Auld.

If there are a large number of hogs we would either secure one of the regular galvanized iron tanks or one may be built of concrete. They are built narrow so as to hold as little solu-

STEADY AND QUIET ECONOMICAL OF FUEL

Western Gas Engines consuming special gas oil at 2⅜c per gallon, cost one third of a cent per H.P. per hour to operate.



All our years of engine building experience are concentrated in the new model WESTERN GAS ENGINES. We have left out every unnecessary part. Wearing parts could not be made better. When writing advertisers, mention The Cultivator.

tion as possible and yet give opportunity for the hogs to swim to the opposite side once they plunge in. Where one has a very few hogs it is perhaps more economical to have a spray pump and give thorough spraying. This takes much more time but is almost as effective and even preferred by some. There are numerous dips which are known to be very effective. They may be purchased of any house handling supplies for stock. Among them are a two per cent solution of creolin also the common tobacco solution, or any dip used for sheep scab; also chloro naphtholeum, zenoleum, Lincoln's dip, Lee's carbolic dip, and we doubt not there are many others. The hogs should be dipped or sprayed every three or four weeks. The point is not so much what is used as the thoroughness and frequency with which the work is done.

Peaches in Alfalfa

Can peaches be grown on the same land with alfalfa?—Subscriber, Huntington Park.

Possibly they can although we would not recommend it where the effort is made to produce thoroughly good fruit. Where the trees were already planted and one wished to grow a strip of alfalfa down the row it could perhaps be done without serious injury for a few years, but ultimately the peach trees will demand all the ground.

ANNUAL MEETING OF SAN DIEGO FARM BUREAU

Farm Adviser H. A. Weinland of San Diego County announces the tentative program of the first annual meeting of the county farm bureau. It will be held on the grounds of the Panama-Pacific at San Diego on March 20.

10:00 a. m. Opening Exercises. Greetings by the Mayor or President of the Exposition, Organ Rostrum. The Farm Bureau Movement, B. H. Crocheron, Assistant Professor Agricultural Extension. Business meeting. Report of Committee on Constitutional Amendments. Financial Report of Treasurer. Election of officers. Farm Credits, Dean Thomas F. Hunt, College of Agriculture, Berkeley.

1:30 p. m. Field Crops, Prof. J. W. Gilmore, Department of Agronomy, University of California, Public Service Building. Farm Management, Prof. Adams, University of California, Organ Rostrum. Organ Recital. The Dairy Cow, Dean Van Norman, University Farm School, Davis, Organ Rostrum. The California Citrus Industry, G. H. Powell, Manager California Citrus Fruit Exchange, Public Service Building.

GLENN COUNTY'S NEW FARM BUREAU

W. H. Heileman, newly appointed farm adviser for Glenn County, writes:

The organization of a Farm Bureau in Glenn County is favorably in progress. Previous to March first four farm centers had been organized in the county, and during the first week in March two more centers were organized.

The farm adviser for the county began his work on March first. A director's organization has been perfected and two public meetings have been held at farm centers.

The people are enthusiastic regarding the outlook in the county and are generally giving their support. Meetings are well attended and indications are that the organization will become strong in the county.

Schedules for handling the work are not yet perfected though in the centers formed to date matters are working smoothly.

My address for the present is Chamber of Commerce, Willows.

Mutton is rapidly coming into its own as a meat for the family. Butchers are now selling mutton freely in the cities and towns. Sheep men who have fat mutton sheep find no difficulty now in exchanging these animals for cash.

CITRUS Trees

Before you place your order for citrus trees, be sure to see us and get our prices and suggestions. We are recognized as the largest and most successful growers of citrus and deciduous fruit and ornamental stock on the Coast.

AH, SWEET IS TIPPERARY

Ah, Sweet is Tipperary in the spring time of the year,
When the hawthorn's whiter than the snow,
When the feathered folk assemble and the air is all a-tremble
With their singing and their winging to and fro.
When queenly Slievenamon puts her verdant vesture on
And smiles to hear the news the breezes bring;
When the sun begins to glance on the rivulets that dance—
Ah! sweet is Tipperary in the spring!

Ah, sweet is Tipperary in the spring time of the year,
When the mists are rising from the lea,
When the golden vale is smiling with a beauty all beguiling,
And the Sair goes crooning to the sea;
When the shadows and the showers only multiply the flowers
That the lavish hand of May will fling;
When in unfrequented ways fairy music softly plays—
Ah! sweet is Tipperary in the spring!

Ah, sweet is Tipperary in the spring time of the year,
When life like the years is young,
When the soul is just awaking, like a lily blossom breaking,
And love words linger on the tongue;
When the blue of Irish skies is the hue of Irish eyes
And love dreams cluster and cling 'Round the heart and 'round the brain, half of pleasure, half of pain—
Ah, sweet is Tipperary in the spring!

—Denis A. McCarthy.

WINIFRED'S BEST YEARS

Winifred Lane and Josiah Dent had been lovers since their A B C days. For 17 years now she had worn the ring he had sold his first colt to buy. Together they had "stood up" for her brother Dick and Eliza at Dick's first wedding, while all the assembled company commented upon them and looked forward to another wedding.

Her father's failing health had brought the first postponement. Then Dick came home a widower and his delicate baby became Aunt Winnie's charge. Dick's second marriage had brought a gleam of hope. But Julia Rebecca declined to live on the farm, and Dick bought a place in another town, leaving to his sister the care of her mother and the farm. Six years later Mother Lane and Julia Rebecca had both died in the same week, and Dick, cheerfully consigning his orphan brood to his sister's care, had taken an extended trip West.

Through it all Josiah had waited patiently, declaring always when Winifred offered him his release that there was but one woman in the world for him, and Winifred had settled down to cheerful performance of daily duty, brightened by the "some day," that would yet be hers.

The patiently awaited day seemed near at hand on this dull November afternoon. Richard Lane had unexpectedly appeared at his sister's home accompanied by his third wife, and without any unnecessary delay had taken his children to the Western town in which he was located.

Miss Lane stood on the front veranda and watched the loaded wagon drive away. "Dick hasn't had any kind of luck with wives so far, but I've a notion this will last," she said aloud as she went slowly indoors.

How still it was! The children's voices seemed to echo through the empty rooms. Winifred's eyes filled with scalding tears.

"Yes," she said in a tone which held both regret and relief, "they're gone for good, and I s'pose I'm free at last. Of course he'll hear," she continued presently. "May'be he'll be over tonight. I'd better tidy up."

Miss Lane lit the parlor lamp and, after a little hesitation, pinned on her best lace collar. "It'll do no harm even if nobody comes," she argued to herself.

But the clock struck 8 and 9, and no one came. "He hasn't heard yet," she assured herself as she went to bed.

The vigil was repeated the next evening and the next. Winifred became perplexed.

"When Dick married his second Josiah was here before tea time," she reflected. "But I won't begin to worry until Sunday," she sensibly determined. "Josiah 'll be at church, and he'll hear about Dick."

Sunday was ushered in with a drizzling rain, but in the afternoon the sun shone bravely. Miss Lane went to evening service attired in the neat gray dress and bonnet which had been purchased for her brother's second wedding, twelve years ago. Feeling lonely, she gladly accepted an invitation from the minister's wife to a seat in the front pew. She could not see Josiah, but she felt his presence two pews behind, and his deep voice in the hymns sent thrills of pride to her loving heart.

With pardonable coquetry, she lingered a little going out. A casual glance through the open door assured her that he was waiting in the entry as of old. She had nearly reached him. In another minute she would have slipped her hand within his arm with the fond assurance of ownership when a blond head, surmounted by a bright red turban, came between them, and Josiah went down the steps with pretty Nettie Searles clinging to his arm.

Miss Lane walked home through the starlight alone. Lighting the lamp, she went directly to a mirror and gazed long and thoughtfully at the reflection within, comparing it with the girlish prettiness of the face beneath the red turban. The glass refused to flatter. The angular form, the careworn brow and hollow cheeks, the lines about the patient mouth, all spoke of burdens borne and labor accomplished.

"It isn't to be wondered at," Winifred said, with a sigh, as she stirred the low fire and settled down to retrospection and consideration.

"My best years have gone and I've got dull and uninterestin' in all this time."

Her first thought was one of renunciation. The freedom she had offered in years gone by she would freely give now. But she thought of the future and hesitated. Not on her own behalf—self had been put entirely out of the question from the first. But as she remembered tales of Mrs. Searles' housekeeping and the flippant remarks she had heard from Nettie's lips she felt suddenly impelled to warfare on Josiah's behalf.

"Red cheeks and dimples can't insure a comfortable home," Miss Lane decided sagely. "If it was any nice girl that's been well brought up I wouldn't hesitate a minute. But all Bloomville knows that Nettie's reputation for dressing and flirting far outdoes her skill in housekeeping. I've no right to shrink from trying to save Josiah from a miserable home. His one hope is in my holdin' him fast to our engagement, and, talk or no talk, I'm going to do it.

"I'll spend the winter with Cousin Emma," she decided. "There ain't a soul in Bloomville knows her address. Dick says she don't look within a dozen years as old as I do, and she's a year older. She always was real tasty. Maybe I can pick up a few hints from her. Looks and dresses and general up-to-dateness makes lots of difference to a man."

All the next day she toiled steadily setting her house in order. And Tuesday morning while waiting for the expressman she penned a note to her recreant lover:

Dearest Josiah—I write to inform you that I am well and expect to

See the Exhibit of

LUITWIELER PUMPS

at Both Expositions

Luitwieler Pumps of different styles and sizes are in actual operation at both expositions. Do not fail to see this interesting exhibit. Experienced pump men are there to fully explain the operation of these pumps. One unusual feature of the Luitwieler exhibit is the operation of a stock pump at full speed, resting on glass tumblers with nothing to hold the pump down. This splendidly proves the easy running qualities of Luitwieler Pumps and the total absence of jar, vibration, excessive friction, etc. Write for our free Pump and Irrigation Booklets.

Creating a New Art

At the Centennial Exhibition at Philadelphia, the exhibit of the Bell System consisted of two telephones capable of talking from one part of the room to another.

Faint as the transmission of speech then was, it became at once the marvel of all the world, causing scientists, as well as laymen, to exclaim with wonder.

Starting with only these feeble instruments, the Bell Company, by persistent study, incessant experimentation and the expenditure of immense sums of money, has created a new art, inventing, developing and perfecting; making improvements great and small in telephones, transmitter, lines, cables, switchboards and every other piece of apparatus and plant required for the transmission of speech.

As the culmination of all this, the Bell exhibit at the Panama-Pacific Exposition marks the completion of a Trans-continental Telephone line three thousand four hundred miles long, joining the Atlantic and the Pacific and carrying the human voice instantly and distinctly between New York and San Francisco.

This telephone line is part of the Bell System of twenty-one million miles of wire connecting nine million telephone stations located everywhere throughout the United States.

Composing this System, are the American Telephone and Telegraph Company and Associated Companies, and connecting companies, giving to one hundred million people Universal Service unparalleled among the nations of the earth.

spend this winter in the city. I leave today, so I shall not have the pleasure of seeing you before I go. But you will be constantly in my thoughts, and your ring, as always, will be my reminder of our engagement. Yours until death. WINIFRED.

"It will show him that I'm holdin' him fast," meditated Miss Lane as the train sped cityward. "And as I didn't give any address, he won't know where to write. He isn't one to go very far with that Searles girl until he breaks with me. And he can't break with me until he finds out where to send a letter."

Bloomville was golden with dandelions and white with apple blossoms when Winifred Lane came home to her own. "Not a soul knows I've come," she reflected as she unpacked the new trunk. She sighed suddenly. "Well, by tomorrow I shall know. He's had the winter to consider in, and if he's still set upon it, I'll give him up."

Josiah Dent came up the church steps with a look of discontent upon his comely face. In the months that had passed since Winifred's disappearance, he had nursed a growing sense of injury.

"'Tain't fair," he complained, "keeping a fellow on the fence so. Her best years have been spent for Dick anyhow, and a woman ages faster'n a man. If she'd given me her address, I'd have settled it months ago."

Josiah went up the aisle to his own pew. Above the high back of the minister's pew there arose a white sailor hat, swathed with an airy muslin scarf. Beneath it soft waves of curling hair rippled across a brow from which all traces of care had been resolutely smoothed away.

Josiah, watching with some curiosity until she turned her head slightly, caught the clear profile and noted the soft color in her cheek. It was Winifred! All at once there dawned upon him the truth that immortal youth is not at the mercy of added years and that better than the passing beauty of girlhood is that womanliness which shall outlast the ages.

"I'm glad I didn't know where to write," thought Josiah, with a sense of narrow escape and a growing feeling of anxiety.

Winifred was unaware of his presence until she heard his voice in the closing hymn. As the last notes ceased she turned to him, smiling straight up into his anxious face.

"Well, Josiah," she said.

And Josiah wondered why he had not known before that raiment, whether it be the unbecoming gray of past years or the crisp muslin that seemed to give back to him the love of his early years, was not worthy of a passing thought. It was the old Winifred who smiled up at him out of those clear eyes. Nettie Searles and the throng about them were alike forgotten. He only thought of the woman before him—the only woman in the world for him—and all Bloomville had its answer to a long winter of speculation and comment as he stooped to kiss her in the crowded church. Winifred Lane's best years were yet to come.—Exchange.

PLAYING SAFE

A man who, with his wife, is employed on a truck farm in New Jersey, found himself in a bad predicament, when, in attempting to evade the onslaughts of a savage dog, assistance came in the shape of his wife.

When the woman came up the dog had fastened his teeth in the calf of her husband's leg and was holding on for dear life. Seizing a stone in the road, the man's wife was about to hurl it, when the husband, with wonderful presence of mind, shouted:

"Mary! Mary! Don't throw the stone at the dog. Throw at me!"—New York Post.

HIS SHARE

"You can't fool all the people all the time," announced the Investigator.

"I know it," replied the Trust Magnate. "There is plenty of profit in fooling half of them half the time."—Cincinnati Enquirer.

Not in the clamor of the crowded street,
Not in the shouts and plaudits of the throng,
But in ourselves are triumph and defeat. —Longfellow.

HOUSEHOLD QUERIES

Canning Pimentos

In response to recent request in these columns for directions for canning pimentos we have received the following from Mrs. D. H. Tarbet of Onarga, Illinois.

There is no homemade canned product that meets so many practical needs as this. Pimentos serve as a garnish as well as a component part of many salads and entrees, and are delicious when chopped and mixed with cream cheese for sandwich filling. If kept in the icebox or a cold place, they do not spoil, or deteriorate quickly after a jar has been opened.

Wash one peck of large red peppers or pimentos in cold water, cut a slice from the stem end of each, and remove the seeds; then cut in thin strips by working around and around the peppers, using a pair of scissors. In this way the strips may be kept as long as one desires. Cover with boiling water; let stand three minutes, drain and plunge into ice water to cover, in which there is a large piece of ice. Again drain and pack solidly into pint glass jars. To one quart of vinegar add two cups of sugar; bring to the boiling point and let boil 15 minutes. Pour over the peppers to overflow the jars, adjust the covers, and store in a cold place.

Another Method

If you have been among the wise people who set out a lot of the sweet bell peppers this spring you will not only have something good all through the season, but you can put them up for winter use. They are called "pimentos" when sold in the stores, and are very expensive. After they ripen and turn red take out the seeds and the tough inner stringy portions and pour boiling water over the pods. Let them stand five minutes, then pack them in the little half pint or quarter pint glass jars honey and various condiments come in. Fill with boiling water and sterilize an hour a day for three successive days, or give them five hours of continuous cooking on one day. So little is needed as an addition to cooked corn, cabbage salad sandwiches, etc., that the small jars are preferable. The peppers mold easily after being opened, and it is a waste to have large cans of them.

Recipes Wanted

Will some of the readers of the household department give some tried recipes for orange marmalade and oblige a constant reader of the paper from San Jose?

Another Request

I would like to see some recipes for making orange marmalade with lemon in, also recipes for cooking rabbits, Belgian hares, in the household department of your paper. They would be much appreciated as we have plenty of oranges and rabbits, and would like to know good ways of fixing them.—Mrs. E. M., Fullerton.

Next Week

Next week's Cultivator will contain many orange recipes to do honor to Orange Day, March 20. There will be some excellent marmalade recipes, but we hope the above requests will be answered by housekeepers with their best tested marmalade recipes.

Because of Orange Day coming on the 20th the rice recipes will not be published until the issue of the 25th; rice will give way to oranges. An almost bewildering number of splendid rice recipes have been received and we know they will be read with great interest by all Cultivator housekeepers.

A fit of anger burns up a good deal of vital force. Some men seem to be angry about half the time. Such men it may be observed, never accomplish much in the world. Anger tears down the nerves and the angry man wants to tear up things in general.

When you are feeling grouchy, let the sunshine in;
When your face gets feelin' hard crack it with a grin.
Don't be 'fraid of wrinkles, tear loose with your mirth;
An old face laughter-wrinkled is the sweetest thing on earth.

NO PRACTICE NECESSARY

The cub reporter saw a hearse start away from a house at the head of a funeral procession.

"Who's dead?" he inquired of the corner storekeeper, who was standing near his door, gazing at the conveyance.

"Chon Schmidt."

"John Smith!" exclaimed the cub. "You don't mean to say John Smith is dead?"

"Vell, py golly," said the grocer, "vot you dink dey doing mit him—practicing?"

"Willing workers work wonders."

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Stewed Apricots
Cheese Omelet Cornmeal Puffs
Coffee

Lunch or Supper

Creamed Sardines
Scalloped Macaroni and Tomatoes
Fruit Gems Raspberry Jelly
Tea or Milk

Dinner

Braised Beef Tongue Stuffed Potatoes
Carrots au Gratin
Pimento and Cottage Cheese Salad
Maple Bavarian Cream Tea Cakes
Coffee

Fruit Gems

Beat the yolks of two eggs, add two cups milk and stir in three-fourths cup dates and one-half cup raisins, scalded, drained and chopped. Mix and sift one cup whole wheat flour, one-half cup cornmeal, two teaspoons baking powder and one-half teaspoon salt, and add to the milk mixture. Beat vigorously for several minutes, then cut and fold in the stiffly beaten whites of two eggs. Pour into hot greased gem pans and bake 20 minutes in a hot oven.

Cornmeal Puffs

Scald one cup milk, add one tablespoon butter, one-fourth teaspoon salt, then gradually stir in one-half cup cornmeal; cook a few minutes, stirring constantly, then cool. Beat two eggs lightly, add to the cornmeal mixture, then add one-fourth cup sugar, one-fourth cup flour and two teaspoons baking powder sifted together. Mix thoroughly, turn into hot buttered muffin pans and bake 15 to 20 minutes in a hot oven. This recipe makes 12 puffs.

Maple Bavarian Cream

Soak two tablespoons gelatine in two tablespoons cold water. Boil one-half cup maple sugar with one-fourth cup water for five minutes, then slowly pour into the beaten yolks of two eggs, stirring constantly. Cook over hot water until the mixture coats the spoon. Remove from the fire, add the gelatine and stir over ice water until the mixture begins to thicken, then fold in the stiffly beaten whites of two eggs and the whip from one-half cup cream. Turn into a wet mould and chill.

Carrots au Gratin

Wash, scrape and dice six medium sized young carrots. Cover with boiling salted water and cook 20 minutes, or until nearly tender. Drain, saving the liquid. Melt two tablespoons butter, add two tablespoons flour, and when mixed add gradually one cup of the liquid in which the carrots were cooked. Boil a few minutes until thickened, then add one-fourth cup grated cheese, one-half teaspoon salt, dash of pepper, and the carrots. Mix well together, pour into a buttered baking dish, cover the top with buttered crumbs and bake until well heated throughout and browned on top.

Buttered Crumbs

Dry in the oven all small pieces of bread or crusts. When thoroughly dried roll fine, then mix with melted butter in the proportion of about one tablespoon butter to four tablespoons crumbs.

ARGUMENT CLOSED

Jackson and Johnson are not on speaking terms. It all arose as the result of an argument which required some mental calculation.

"I tell you," said Jackson, "that you are altogether wrong in your conclusions."

"Pardon me, but I am not," replied Johnson.

"Didn't I go to school, stupid?" almost roared his opponent.

"Yes," was the calm reply, "and you came back stupid."—Tit-Bits.

UGH!

"Here's something queer," said the dentist. "You say this tooth has never been worked on before, but I find small flakes of gold on my instruments."

"I think you have struck my back collar button," replied the victim.—Buffalo Commercial.

Branch: 1228 H St., Fresno

ing begging. A condition prevails which only time can correct. Something better than a half of California's navels has gone forward. The northern districts of the state are yet shipping, but only in very small quantities. Florida still has a fourth of its crop on the trees. Its finest of grapefruit is going begging, and it has been estimated that less than half of the fruit now held by the growers will ever be marketed. Nearly all California packing houses are running light-handed and some are closed. About one-third of the fruit going forward is being iced. Ventilated fruit is decaying very badly and probably will for the next two or three weeks.

The lemon market is generally depressed and will probably experience no material uplift for several weeks to come.

Shipments

Shipments of oranges to date from Southern California since November 1, 1910, 9,772 cars; lemons, 1233; total, 1105. To same date last season, oranges, 9,836; lemons, 642; total, 10,-528. From Tulare County this season, oranges, 5,104; lemons, 164; total, 5,268. To same date last season, oranges, 4,505; lemons, 30; total, 4,535. From northern counties, oranges, 624; lemons, 1. To same date last season, 392 cars oranges; lemons, 5. Total of all citrus fruits from the state to date: Oranges, 15,500; lemons, 1,398; total, 16,898. As compared with last season same date: Oranges, 14,733; lemons, 677; total, 15,410.

NEW YORK, March 8.—Twenty-eight cars navels, one navelencia, one tangerine, five mixed cars navels, bloods and tangerines, and two cars lemons sold. The market is steady on strictly fancy navels, other grades lower. The market is unchanged on lemons. Weather, fair.

PITTSBURG, March 8.—Eleven cars sold. Market is steady.

ST. LOUIS, March 8.—Market is lower.

KANSAS CITY, March 8.—Two cars sold today by Kansas City Fruit Auction Company.

DRIED FRUIT MARKET

SAN FRANCISCO, March 4, 1915.—The dried fruit market is firm and steady but business is not particularly active. While sales are being made, orders are not coming with any regularity. Many of the trade have supplies still on hand and for their immediate requirements are filling their wants from supplies on hand in their various markets. Steamer space for export business has been hard to get and on account of recent developments in Europe, war risk insurance has advanced, which along with other things increases the cost of shipping.

The demand that we looked for on peaches has not materialized but we are hoping for a better market later. Sales of this variety are being made at prices at which we do not want to sell until forced to. Advices have been received of sales of choice Muirs having been made by others as low as 3¼ cents packed in 50s. We have only a small quantity of peaches left which we hope to work off in mixed cars at much better prices.

There is practically no change in prunes and while prices are being held strong the price in some instances is being shaded by outsiders. Many small packers are anxious to clean up so are making prices with this object in view, a little under the quotations held by the larger operators.

Apricots are strong and cleaning up and the market inclined to advance. We think there will be no difficulty in cleaning up our holdings in a short time.

There is very little doing in pears, but this variety also will have a better demand before long and prices will be dependent upon the grade.

Raisins are about the same as last report. There is very slight demand for figs, but a better one is looked for before very long.

Considerable export business has been done by everybody, but the European war has increased the risk and the cost to such an extent that it is those who are willing to take the biggest chances are handling the most business.

Inquiries are being made for prices on 1915 crop prunes and we understood that as low as 3¾ cents base has been offered and some sales, we are informed, have been made at 4½ cents base on 60-70s. But this is an uncertain and dangerous business as no one can tell what the future will bring forth. It is a gamble pure and simple on the prices prunes will sell for when dried and ready for consumption. The buyer is taking his chances of the market later being higher and giving him a profit; the grower, when he sells, practically says the market will not be higher. It is a pernicious practice; aside from the moral aspect of crimes of this kind, which are bad enough, the effect upon the growing of fruit cannot help being injurious, and it is injurious. Growers as a rule know how this works out, if the market is lower they will nearly always have trouble in making their deliveries and those buyers who do accept the goods will be much more exacting in their requirements. If, on the other hand, the market is higher deliveries of nearly everything that looks like fruit, whether in good or bad condition, may be admitted. Whichever way it goes either one side or the other is dissatisfied. We are all familiar with the means employed by buyers of dried fruit to bid down the market price in California if they are still short at a lower price than they can buy for, which is also another feature of the gamble that loses to the growers of prunes and other fruits, and to the state also, a large amount of money year after year. It is much better not to speculate but to take the average of the markets, which the owners can do by cooperation and marketing their own fruits. No one is able to tell when the lowest point in the market has been reached. No one can tell when the highest has been reached. Bq cooperation and pooling the fruit you always get an average and do not have to worry as to when is the right time to sell.

Not long ago in San Francisco ex-Governor Martin H. Glynn of New York, gave a talk and described the system of the Land Bank in New York state. He stated that this system brings about a saving of $240 on every $1000 in ten years. On their farm indebtedness of $100,000,000 it saves $2,400,000 a year. How much this would save for California farmers you can figure out by applying this ratio to their mortgaged indebtedness. This system is worked out in France and Germany and it will work in New York and California. It not only saves money for the farmer but encourages people to go on the farm and till the soil. A bill for a proposed land bank law has been introduced in the California state legislature and will be considered at this session. (Statistical figures give the farmer's debt in the United States at approximately $5,000,-000,000.00, and while it is estimated that such accommodation to a large extent carries with it usury payments for exchange and commission, authoritative figures give the average limit for loans of this nature at nine and ten per cent per annum).

By such statements it is readily conceived that the existing system by far fails to satisfy the great needs of agriculture. Furthermore only a small portion of the farmer's credit is bankable, notwithstanding the fact that a federal reserve bank provides that any national banking system not situated in a central reserve city may make loans secured by improved and unincumbered farm lands within its federal reserve district, but no such loans shall be made for a longer time than five years nor for an amount exceeding fifty per cent of the actual value of the property offered as security.

Cooperation on the part of the growers will very much help to work out all of these matters and many abuses which the farmer now has to put up with can be done away with as soon as the farmers realize that by standing together and forgetting their own individualism they gain strength and with strength almost anything within reason can be accomplished.

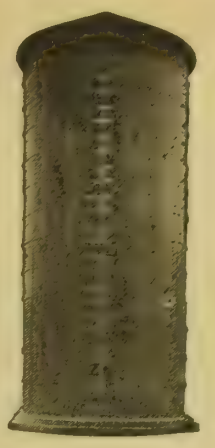
Under the head of "Fundamental Principles of Cooperation in Agriculture," Dr. G. Harold Powell of the California Fruit Growers' Exchange, a cooperative organization which has proven a great success and which has been of great assistance and good to the farmers, states:

"A cooperative organization of farmers must be founded upon economic necessities if it is to be successful and must have strength enough to live in the face of the competition to which it will be instantly subjected. It must compete with existing organizations and this competition will be directed towards eliminating it. It will be viciously attacked and every conceivable form of misrepresentation will be leveled against it; the officers will be attacked by insidious rumors concerning their ability or integrity; the banks established in the nearer sections may be controlled by competitors and may refuse to advance the necessary credit, and every weapon known to competition, either legitimate or disreputable, will be used to put it out of business. The average producer is not a business man nor is he skilled in the arts of competitive business; he is naturally a strong individualist; he is slow to delegate authority over his affairs to any one and when he is face to face with the skillful arguments of those who desire to break an organization and keep him working as an individual, he is likely to weaken and finally leave the organization unless he has felt the effect of hard times and helplessness arising from the competition of those who buy and sell his product, or other forms of oppression. It is an historical fact that the investment of a farmer must have been threatened by existing conditions before he has been able in the past to overcome his individualism sufficiently to work with his neighbors in cooperative harmony. Cooperation to be successful must be founded not only on economic necessity, but it must grow through actual evolution. It must have a simple beginning and grow in strength through experience step by step. The fundamental mistake that is being made in many localities is to form a farmers' organization all at once on the plan of the organization that has taken years to develop. The plan may be sound but a cooperative organization can only exist when given the unflinching support of the members, who, through years of experience have acquired an appreciation of the fundamentals that underlie a successful association of its kind. The success of any organization depends on its members, not on its form."—California Cured Fruit Exchange.

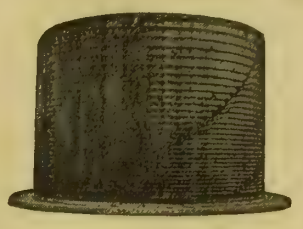
SILOS

BUILT FOR YOUR PARTICULAR NEEDS.
EXACTLY AS YOU WANT THEM.
ALL SIZES AND DIMENSIONS

16 x 36 Redwood Stave Silo manuafactured by us for the Panama-Pacific International Exposition, San Francisco, 1915



TANKS

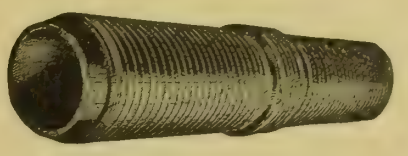


Built to order, to suit all uses and users. Cheaper than metal tanks, last longer. Won't rust. Can be taken down and re-erected without damage. Capacities, 500 to 500,000 Gallons. Towers included if you want them.

PIPE

MACHINE BANDED OR CONTINUOUS STAVE

For water supply—irrigation or power. Cheaper than any other pipe of equal size or capacity. Longer lived than any metal pipe except cast iron.



All our silos, tanks and pipe are designed by engineers to meet every condition. Made in our big factory from CLEAR, AIR DRIED REDWOOD. Selected from a stock of 40 million feet which we carry at all times.

The Yuba Ball Tread Tractor is the ideal tractor for orchardists.

With it, a man can plow up one row and down the next, throwing the earth to or from the trees. It can be turned in a space but a few inches wider than its length.

The Yuba Ball Tread Tractor gives great power, yet is small enough to run close to the trunks and under heavily laden branches without injuring the trees.

It is heavy enough to get ample traction, yet its weight is so evenly distributed over a large area that it does not pack the soil.

THE YUBA BALL TREAD TRACTOR

When not plowing or cultivating, the tractor can be used to operate irrigating pumps or other stationary appliances. It is an investment on which the owner gets maximum returns.

And, above all, it is economical, and simple—so simple that farmhands of average intelligence operate the machine and make repairs or adjustments.

There is a booklet describing its uses and construction fully.

Vol. XLIV No. 11 LOS ANGELES: THURSDAY, MARCH 18, 1915 One Dollar Yearly

Value of Careful Handling of Citrus Fruits

Prof. J. Eliot Coit Writes for Cultivator Readers, Giving Information as to Experiments Performed at the State University

THE lemons shown in the accompanying illustration were picked in December, 1913. They were photographed in March, 1915. They are still in excellent condition, juicy and of good flavor. They might be easily sold on the market today. The acid test shows that the juice contains 5.7 per cent of citric acid, while fresh lemons bought on the market the same day tested 6.3 per cent, a difference of only six-tenths of one per cent. These lemons have not been in cold storage. On the other hand they have been on a table in an office room which is steam heated more than half the time during the year.

This result has been accomplished by preventing decay and keeping the fruit from drying up. The decay has been prevented simply by handling the fruit carefully and not allowing the skin to be scratched or broken, thereby admitting the almost ever-present spores of decay-producing fungi. The juice has been retained by keeping the fruit under a glass moist chamber just as the lunch counter man keeps his sandwiches moist and fresh.

This experiment was begun for the purpose of demonstrating to students the value of careful handling, but it was not thought at the beginning that the fruits would remain in good condition for so long a time.

The oranges shown in the illustration had been in the bell jar about four months, and though they settled a good deal and sweated continually they showed no fungus decay.

LEMONS FIFTEEN MONTHS AFTER PICKING

After citrus fruits are picked from the trees they are not to be regarded as so much dead matter. They are still alive and continue to respire for an indefinite time. In the event that a parasitic fungus gains access through some abrasion or through the button, they are soon reduced to a disorganized mass by the growth of the mold plant. If we accept the definition of "weed" as a plant out of place, then the decay molds may be regarded as weeds. If they are not inoculated but are left in contact with dry air they will gradually lose moiseure until they dry up into brown balls as hard as wood. If they are protected from both evaporation and fungi they will live a long time, as the experiment shows, but will eventually become so weakened by the loss of carbon dioxide, which is continually given off as a result of the life processes going on, that they will finally succumb to enzymatic fermentation.

While the healthy unbroken skins of citrus fruits are resistant to the spores of blue, green, and some other molds, it should be remembered that some fungi (notably the citrus brown-rot fungus), are able to infect and cause decay in perfectly sound fruit. The reason for this is that the brown-rot spores are motile and, being capable of swimming about in a film of water, are able to enter the natural breathing pores and start decay. To succeed therefore in keeping fruit it is necessary that it be freed from the spores of this fungus, which is easily accomplished, where necessary, by dipping the fruit in a dilute solution of copper sulphate.

What is known as the sweating of fruit is nothing more than the condensation of the moisture which is given off as water vapor together with carbon dioxide in the process of respiration. Such condensation takes place whenever the temperature falls below what is known as the "dew-point." Sweating in itself is not injurious and does not cause decay as many people think. All the fruits in the experiment were kept in a saturated atmosphere, and the condensed moisture dripped down over the oranges continuously.

While unbroken skin is resistant to blue and green molds, which are the parasites responsible for most of the decay in transit to market, the buttons, which are in all cases on the fruit, are not long resistant. When the fruit begins to age after several months' storage, the buttons, which were at first fresh and green, turn brown and succumb to various fungi. Often the withertip fungus causes decay of the buttons after they have become weak. In this case tiny salmon-colored spore masses appear on the buttons. After the withertip, or simultaneously with it, other fungi such as botrytis and alternaria begin growth. Usually they get no farther than the button for many months, but in case the fruit is weak, as is the case when lemons are allowed to ripen on the trees, they grow from the buttons into the lemons and, following the fibrovascular bundles which radiate from the stem through the spongy tissue under the skin, produce a slow decomposition and browning of the tissue. Usually the central core is affected also and the lemon becomes soft and structureless on the interior before there is any exterior indication of decay. In some packing houses this is known as "old age decay." There are not as many lemons in the experiment now as there were in the beginning. A few have recently gone down with alternaria core rot, which gained access through the dead button. When the lemons are picked just as they change from green to silver and properly stored they are most resistant to this type of decline, and as the experiment shows, may be kept a year or more. When, however, the trees are used as storage houses and the winter crop left on until it is tree ripe, the fruit loses in keeping quality. Often lemons are left on the trees in the hope that the undersized ones will grow even after they are fully colored. While this is to a certain extent true, it should be remembered that such fruit is short lived and should be hurried into consumption as fast as practicable.

CAREFULLY PICKED ORANGES FOUR MONTHS IN SATURATED AIR AT ROOM TEMPERATURE. NO DECAY.

No one should conclude from the experiments that fruit must be kept at room temperatures for best results, for it is well known that the life processes of the fruit are slowed down by temperatures a few degrees above the freezing point and the final weakening of the tissues considerably postponed. The fact that the fruit in the experiments was kept at living-room temperatures was simply an extra handicap which served to emphasize the value of careful handling.

In conclusion, this is the point to be emphasized: Outside of a possible infection with brown rot, careful handling is the most important factor in the control of fruit decay. Refrigeration should not be expected to take the place of it. When citrus fruit is properly picked at the right stage of maturity and carefully handled, it has truly wonderful keeping qualities.

Marketing Citrus Fruit

Written for California Cultivator by Geo. W. Waterbury

Is Our Present System of Marketing Adequate? Growers Call for Consideration of Methods

AT the present time I believe there is no phase of the citrus business in which orchardists are so vitally interested as in the marketing of their fruit. Many a minor controversy has been lost in the one big, pertinent question just now, how to make fruit raising pay better, or to even pay. I doubt if even the determination of deep or shallow plowing can be brought back to its former prestige until prices received by the growers are improved.

Nor is the present unrest confined to the citrus growers of California and Florida. During the first of the year the Yakima Valley Fruit Growers' Association met and unanimously passed the following resolution:

"Resolved, that this meeting express its hearty approval of every effort which has been made in the past to build its own marketing agency whereby the products of our orchards are brought direct to the wholesalers and the retailers of the country, and to secure for these products the widest sort of distribution; and

"Resolved, that we instruct our representatives to do everything in their power to hasten the time when all of our products shall be offered direct to the trade without the intervention of brokerage firms, commission houses and commission men."

The Covina local exchange of the California Fruit Growers' Exchange recently adopted resolutions calling upon the latter to take up the question of selling direct to the consumer, and the Orange Heights association at Corona, I understand, is to frame a somewhat similar petition. All this is but the forerunner of more agitation of a similar nature which is bound to come.

In the early days of citrus growing in California the first products were all sold locally, usually at very good prices. Then with more groves coming into bearing and improved railroad service to the eastern states California oranges commenced to flow gradually in that direction until the local consumption was a small affair. The coming of the Washington navel and the big freeze in Florida of 1896 all gave new leases of life and added impetus to the industry in California.

Meanwhile Florida went to work to rebuild her shattered industry which again looms large on the horizon; shipments from there at the present time totaling about 17,000 cars of oranges and 4,000 cars of grapefruit, a little over three quarters of her season's output.

Planting in California, both in Southern California and in the Porterville region, has been heavy, rather too heavy, during the past ten years. It seems to be an infallible rule in human nature to plant whatever fruit trees are paying best at the time of planting, irrespective of the one paramount question as to whether that particular fruit tree is best fitted for the exact location in which it is to be placed. It is surely going to be a survival of the fittest in the end. Six years later those newly planted trees are bearing a little and who can tell six years in advance what particular article of commerce is going to pay the best?

Fruit growers first marketed through consignment to eastern fruit firms and by selling for cash on the trees to local investors. The abuses under these respective systems were many. Under the first too much of the growers' time was consumed [illegible] trips to the east to ascertain [illegible] freight rates should be paid at

California end and in the local sales way why so many land and crop mortgages were held by so few men.

The rise of the California Fruit Growers' Exchange seemed to mark the beginning of a new era, where waste in handling and selling would be cut to the bone and the growers get at least one hand on the whip end. This system did bring order out of much confusion, improved selling conditions immensely and gave new hope to the industry. Unfortunately it has no power to fix new acreage to be planted yearly nor establish lowest prices in selling.

In our growing the greatest care has been exercised to eliminate chance; it has been marvelous, this elimination of uncertainty in production. Our trees are fed scientifically, more scientifically than the human race; they are watered and warmed with precision and pruned with the utmost skill as to ultimate needs. Nowhere on earth has such skill been exercised as in the mutual prevention of scale and insect injury, and yet when we come to planting and selling our fruit order vanishes; it is a case of chance from beginning to end.

Let me illustrate. If prices were good this year and returns liberal, speculative companies could be formed to plant out 100,000 acres. This acreage is much too high, and in a few years, if these trees are any good, will flood and break the general markets, whereas, say, an annual increase of five or ten thousand acres might be just right to supply the natural increase in demand. Public sentiment, or a general unit control of marketing California fruits, could prevent overplanting, if such would be allowed by our government. Tobacco planters in Kentucky eventually cured the overproduction problem in tobacco, but it took a good deal of night work to accomplish it, and the manner, though effective, was rather strenuous.

In marketing, our fruit is started out in big volumes at this time of the year, some of it on orders and the rest to land where it may and when it may. There is no accurate way of determining what the price is going to be on a car of oranges or lemons when shipped unless consigned on a definite order, and then if the market breaks in the meanwhile the quality is bound to be found defective upon arrival.

But in selling for cash conditions are no better at this end and the quantity offered is surely going to affect the price unless control of that selling price is made and kept by an organization big enough to do so. To accomplish this it seems to me that eventually the citrus fruit industry of California must take a hand in passing it on to the consumer. I do not believe the jobber or wholesaler's prices for handling are unreasonable, but when the retailer has added his final toll the last straw has been added to the fruit grower's shoulders and the banks must help him out plentifully in the fall of each year.

Now what is the matter with the retailer? Is he making too much profit in his business? If you ask him he certainly would say, "No," and I do not believe he is. If we think prices have been low on California oranges this winter we have but to turn to Florida grapefruit growers for sympathy and the consolation that misery is supposed to love. Florida pomelo raisers have not been paying freight rates, let alone taxes and shoes for the baby. And why? Because of too great haste in recent plantings and the general tendency of a rather practical public to consider grapefruit at 20 cents apiece or $2.40 a dozen in the nature of a luxury. The Florida pomelo men could not very well dig up their orchards, but they could go for the big dining car systems, and they did, forcing a decent reduction in price.

We know that as the price drops more fruit is called for, thus increasing demand. But to return to the retailer who is not growing unduly rich. The California Fruit Growers' Exchange estimates that he makes over 30 per cent profit on our fruit, and we have often noticed in our eastern papers that first grade California oranges rarely sell for less than 40 cents per dozen, no matter what our price is, and the Boston Transcript's quotations usually call for 60 cents per dozen, equivalent to, say, 100 per cent on their purchase price. The California grower is probably averaging around 15 cents for the same.

The grocers who are handling our fruits at such enormous profits are not getting rich quick because they are not making such enormous profits on other lines of merchandise; a considerable quantity of which is handled at about cost. This is due to the wise policy of the trusts in accurately keeping prices as low as possible for the consumers, thus enticing them to buy more, and to the trusts' principle of taking all the profits in sight. Why not make the sugar sales, the tobacco sales, the kerosene sales and other trust sales carry their proportion of the grocer's revenue? We are told there are no trusts now, so thus their power over the retailer must be no more than that of the California Fruit Growers' Exchange, admittedly not a trust.

I have found oranges selling from retail stores at 30 cents a dozen right in our San Joaquin towns. If a proper local transportation service can be estalished I believe the consumer always likes to deal more direct with the producer. Eight years ago I purchased kerosene from the grocer at 31 cents per gallon; now I get it on my ranch at 10 cents per gallon, delivered in 50-gallon lots direct from the producer; I use more and am better satisfied.

A few years ago the largest coffee wholesale house in the United States decided to sell direct to the retailer from its Boston warehouses. The matter was gone over thoroughly in advance; every move was calculated and possible defects provided for. The firm then was doing a business of about $10,000,000 a year, but selling conditions were not right, too many had a hand in the profit bag.

At a predetermined time the firm sent out its announced policy of selling direct to the retailers of the whole United States, and salesmen went out to deliver the goods. The plan proved a success from the very start, and the same firm is now doing a business of $20,000,000 a year instead of $10,000,000. The United Cigar stores is another instance where distributing houses in each large center of population sell goods of well-known quality direct to the consumer. Five and ten cent stores in the United States and the large Rochdale stores in England are models of low-priced distribution.

The California Fruit Growers' Exchange is a well organized, well governed institution, but the present plan of distribution will probably not be the one in use 10 or 15 years from now. When large numbers of growers are running behind on their expense accounts they are surely going to demand that the very best and most economical system possible be used in securing a large proportion of the total sales from their fruit.

BEET PULLING AND TOPPING MACHINE

Some years ago the Western Sugar Company at Denver offered a $10,000 prize for a machine which would pull and top beets. We doubt not this offer has resulted in much investigation to invent such an implement. A Californian entered this competition and has secured a patent on such a machine. From the letters patent we quote:

"My invention relates to beet pulling and topping machines wherein converging wheels, rotated by the traction of the vehicle and provided with cushioned rims, are adapted to engage and pull the growing beet from the ground after the ground has been broken by a ground breaker on the front of the vehicle, after which the beet is carried to a blade which cuts the top therefrom and deposits the top in one row and the beet in another, and the objects of my invention are, first, to provide means for breaking the ground on both sides of the beet row; second, to provide converging wheels having cushioned rims adapted to engage and pull a beet without injuring or fracturing the skin; third, means for cutting off the tops of the beets; fourth, means for controlling the space between the converging wheels, and fifth, means for elevating and partially rotating the ground breaker."

Cost of Distributing

G. Harold Powell Before the Western Fruit Jobbers

The following address made by Mr. Powell, presenting the matter of marketing citrus fruits, was made to a convention of fruit jobbers. Therefore it is a presentation of facts as the jobber and retailer should see them. It has much of value however for the producer. A serious problem is before business men of any calling with trade conditions as they are today; the orange grower is no exception. It is well for him to look at the problem from all sides before present methods are set aside. Mr. Powell is a thorough going representative of the producer and for that reason has made a thorough going study of conditions in the Eastern markets as well as of conditions in California.

THERE are approximately 200,000 acres of citrus fruits in California, representing an investment of $200,000,000. Eighty-three per cent of the total acreage in 1913 were oranges, and 17 per cent lemons. Two-thirds of the groves were of bearing age in 1913; 85 per cent of these were oranges and 15 per cent lemons. There are now 32,556 acres of lemons in California, 14,500 of which are of non-bearing age. When the non-bearing lemon groves come into bearing the lemon production of the state, even with a moderate yield, will exceed the present total lemon consumption of the United States and Canada.

Increase in Acreage

There has been a steady increase in the acreage devoted to citrus culture in California since the introduction of the Washington Navel orange in 1873. In the ten years from 1903 to 1913 the citrus area increased from 83,657 to 191,357 acres, an increase of 128.9 per cent; oranges increased 138 per cent and lemons 82 per cent during this period. In the five years from 1908 to 1913 the total area increased 29.1 per cent, the increase for oranges and lemons being 23.3 and 67.6 per cent respectively.

Increase in Shipment

The shipment of citrus fruits has also increased rapidly. The increase in five year periods in the number of carloads of oranges and lemons is as follows: From 1895 to 1900, 225 per cent; 1900 to 1905, 71.5 per cent; 1905 to 1910, 10.9 per cent; and 48.5 per cent from 1910 to 1914. A normal crop now is 50,000 carloads, one-seventh of which are lemons. Of the oranges approximately 63 per cent are Washington Navels, 27 per cent Valencias and 10 per cent miscellaneous varieties. The Valencia shipments increased 60 per cent in 1914 and will increase rapidly in the near future.

Increase in Consumption

There has always existed a fear since the beginning of the California citrus industry lest the increase in production outrun the increase in consumption; or, to state it differently, that there might be more citrus fruits produced than the people could consume at a price that would pay the producer. The total consumption of citrus fruits is increased in two ways: First through the increase in population, and second in the increase in the per capita consumption. The increase in population is not rapid enough to absorb the increase in the production of citrus fruits. The population of the United States increased 20.7 per cent from 1890 to 1900; the shipments of citrus fruits increased 195 per cent during the same period. From 1900 to 1910 the population increased 21 per cent, while the shipments increased 292 per cent during the same period. The consumer is using more fruit than in former years, and is using it more and more as an article of food, rather than a luxury. It is through the increase in fruit eating habit of the people that the enormous increase in fruit production is taken care of.

In order to stimulate consumption and to insure a fair return on the investment the industry has been obliged to eliminate speculative distribution by placing its own agents in the different markets of the United States and Canada, through whom the grower sells the fruit to the jobber after the latter determines its condition, or sells it to him subject to condition on arrival. In some markets the fruit is sold on an f. o. b. California basis. The industry is creating a public consciousness of the food value of citrus fruits by advertising on a national scale; it is stimulating the sale by cooperating with the retail dealers and with the jobbers and traveling salesmen by furnishing them with display and advertising material and information on the citrus industry.

Investigations of the California Citrus Industry

The industry has also made a searching investigation of the cultural and labor costs of production in order that it may better understand its problems; it has organized on a co-operative basis the purchase of materials used in the packing houses and in the groves, and it has secured the aid of the state and federal government in order that its business may be conducted economically and the cultural and fruit handling difficulties that confront it may be solved by scientific research. Through better handling methods the industry has lessened decay and has thereby reduced the risk of the jobber and retailer.

There are few American industries that have been benefited more by the application of systematic, organized business methods to its problems than the California citrus industry. Until recently its investigations ceased with the production of the fruit and with its distribution to the jobbers of the country. But as the prosperity of the industry always waits upon the increase in consumption of the fruit at prices profitable to the producer, the industry has undertaken an investigation of the distribution after the fruit reaches the market in order to see how the handling of its own problems can be improved and how its cooperation with the jobber, the retailer and the consumer can be made more effective, its advertising more direct, and the wastes of distribution can be eliminated. The distribution of the nation's food supplies is far more complex than the problems of production, because of the intricate, interwoven relationships of transportation, finance, the assembling and distribution to the consumers after a product reaches the market, and the safeguarding of all the factors involved in the highly complex industrial process. The standard of living of the American consumer has changed radically in the last generation, and the demands of the consumer impose a series of conditions upon the distributing agencies that are increasing in complexity.

AVOCADOS

Bring $40 to $50 a Box In Los Angeles

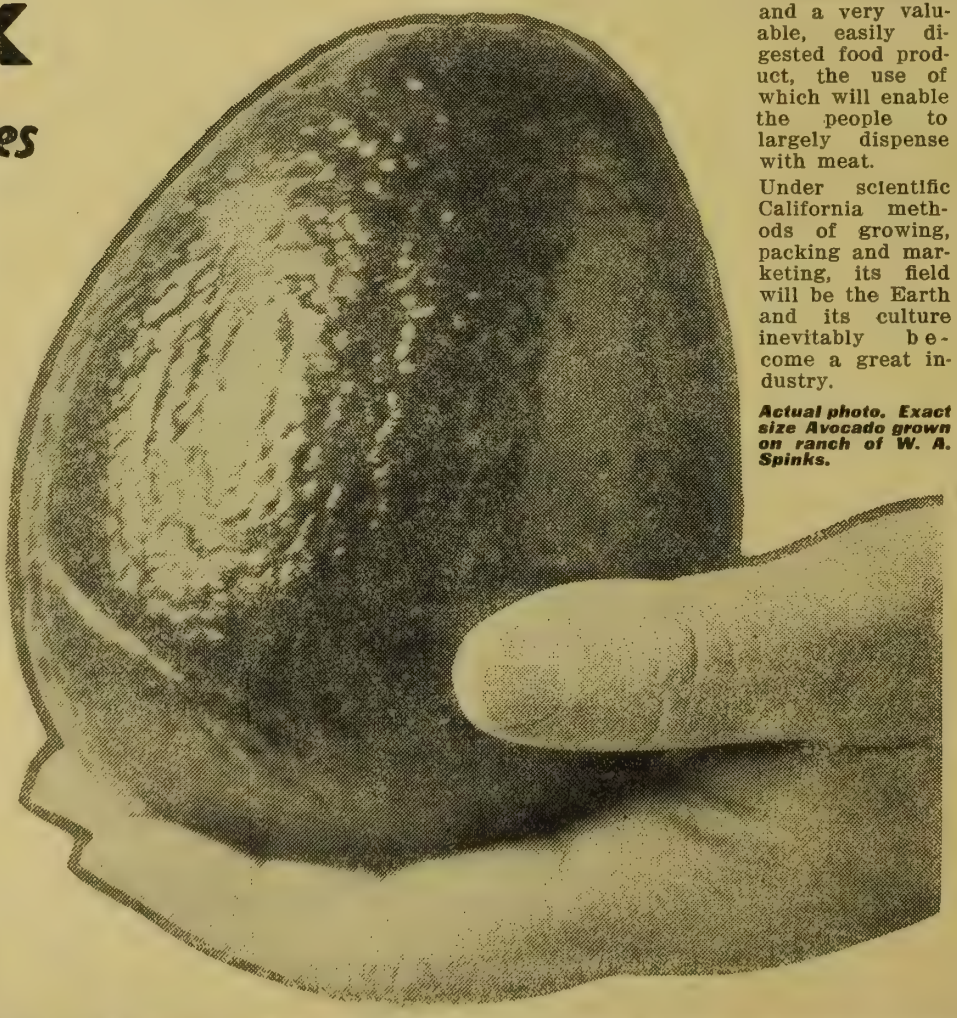
—the great future fruit industry of California—

FACTS YOU OUGHT TO KNOW

Avocados will grow and thrive in California. Properly selected varieties will stand more cold than oranges, require no more water nor general care, do not so readily harbor pests, make nearly twice the growth per year, eventually produce several times the number of fruits per tree, and make most beautiful ornamental trees. The fruits grown in California are entirely superior in richness and flavor to those grown in the Tropics, and find ready sale at fabulous prices.

The Avocado is the most important fruit in the world, being at once an unrivaled delicacy and a very valuable, easily digested food product, the use of which will enable the people to largely dispense with meat.

Under scientific California methods of growing, packing and marketing, its field will be the Earth and its culture inevitably become a great industry.



Actual photo. Exact size Avocado grown on ranch of W. A. Spinks.

"As to the value of the Avocado fruit, no one on earth can question that. It is the most nutritious, easily digestible and delicious of all fruits and if it can be purchased in quantity will sooner or later be eaten by everybody everywhere."—Luther Burbank. Extract from letter of Feb. 20, 1915.

Vigorous field grown trees, 2-year-olds from the bud—of rapid-growing, cold resistant and prolific variety 1¼ inches in diameter or larger, $2.00 each. Will bear fruit in from two to three years. Lower prices on quantities. Take advantage of the times and buy at these low prices. Write for complete literature.

Keep this ad in your scrap book and look at it in ten years from now.

Distribution

The investigation of the distribution of the citrus fruit crop has been made in the principal cities of the United States and Canada through the cooperation of the jobbers and retailers with agents of the industry located in these places. It has not yet been extended to the rural districts. The method of investigation, so far as it relates to the costs, follows: Beginning in January, 1914, the agents, starting with the delivered price of oranges to the jobbers of the 126, 150, 176 sizes, and of the 300 and 360 sizes of lemons, determined the price which the leading jobbers in each place charged the retailers on the same grades and sizes and then determined the retail price to the consumer, both on the box and dozen basis. The data were accumulated every two weeks on the same grades and sizes during the entire year, thereby giving a large number of consistent reports from many places.

To illustrate the results of the investigation, 30 representative cities and towns are selected. There are 5485 reports on oranges from jobbers and retailers. By taking the average price paid by the consumer it is possible to make a distribution of the consumer's dollar back to the grower and to show the different factors which enter into the consumer's price.

Taking 30 representative markets as a whole, including the 5485 reports extending over the year 1914, the factors entering into the consumer's dollar are as follows:

	Per Cent of Consumer's Dollar
Retail distributing cost (gross)	33.3
Grower's selling cost	1.5
Jobber's distributing cost (gross)	8.2
Freight and refrigeration	20.5
Packing house cost	7.4
Cost of picking and hauling to packing house	2.4
Proportion returned for fruit on the tree	26.7
Total	100.0

Summarizing, the data show that 36.5 per cent of the consumer's dollar is returned to the grower in California, of which 9.8 per cent represents the proportion alloted to picking, hauling and packing; 20.5 per cent represents the allotment to transportation; 1.5 per cent, the grower's cost of selling the jobber, and 41.5 per cent the proportion represented by the jobbing and retail gross distributing cost, the latter representing four times as much as the former.

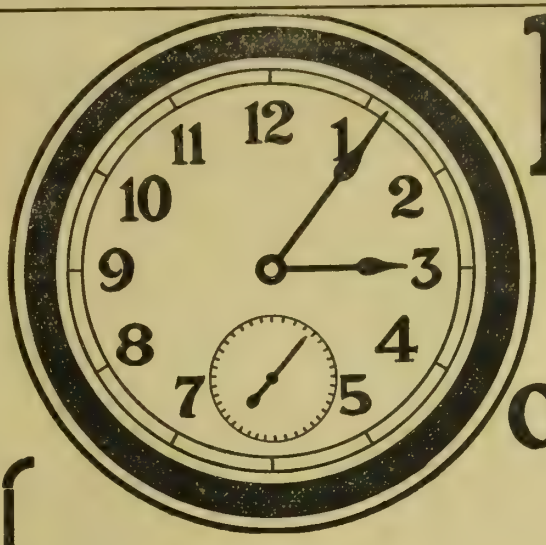
The amount of the consumer's dollar allotted to each factor referred to in the table should not be confused with the cost of handling each of these items. The average cost of picking and hauling a packed box of oranges from the grove to the packing house is 10.5 cents; the average cost of packing and loading on the cars is 32.4 cents per box; the average cost of freight and refrigeration is 90.7 cents a box; the average grower's cost of the cooperative method of selling, including advertising, is 6.6 cents per box; the average mark-up of the Jobber is 14.2 per cent on the purchase price; the average mark-up of the retailer is 49.8 per cent on his purchase price, both of the latter figures including the loss from decayed fruit.

Variations in Distributing Costs

A considerable variation has been found in the proportion of the consumer's dollar that goes to the jobber and retailer in different parts of the country. West of the Rockies and in Canada, for example, the jobber's costs are higher than in the East or in the Mississippi Valley, on account of higher labor costs, higher rents, higher interest and larger geographical distances to be covered by the traveling salesmen of the jobbers. These costs are reduced in the older, more densely populated parts of the country where interest rates are lower and where the various costs of distribution are more economically accomplished. The jobbing costs of the Eastern half of the United States are often not more than one-half the corresponding costs in the West.

There is an equally wide variation in the distributing margins in different cities, sometimes due to the efficiency of the men engaged in the jobbing business, sometimes to natural local conditions, and sometimes to understandings between different jobbers through which a minimum margin is established. The record shows that in one city the average mark-up of the jobbers is approximately 10 per cent. There is the most active competition there, turnovers are quick, the margin on each transaction is small and the per capita consumption is high. In another city, in one of the richest, most fertile states, where a few friendly jobbers work together, buying cars of fruit jointly and selling at a high margin on each turnover, the average mark-up for the year is 22 per cent. The consumption there is restricted, sales are slow, and the business is transacted on an artificial competitive basis.

There is apparently a considerable variation in the margins, due to the number of times a jobber or a retailer turns over his capital. Quick sales at a small margin of profit is the policy usually followed by those who specialize in the citrus fruit business. They make their annual profit on a large, steady volume of business. They attract the consumer with fruit that is always fresh and attractive at reasonable prices. They stimulate consumption by advertising and in other ways. Others, especially among the country retailers, or among jobbers who carry citrus fruits as a side line, do not specialize or push sales. Their losses from decay and off condition are large and their margin on each turnover must necessarily be



Don't Delay -Send in your order for TREES now

This is going to be a season when planting can be done successfully throughout March and April ——— but if you don't want to be disappointed in securing the varieties you want---we urge you to get your order in NOW.

We have had an enormous season thus far and a splendid stock to meet the demand with, but orders are coming in very fast and we don't want to disappoint any of our past customers or any new ones who are counting on setting out the famous "Roeding True Trees."

Our stock still includes all the best varieties of—

APPLES PECANS PRUNES LEMONS
OLIVES APRICOTS ORANGES FIGS
PLUMS CHERRIES PEACHES PEARS
WALNUTS POMELOS

As well as many other fruit trees, vines, shrubs and plants.

Surplus Stock—Special Prices

We have heeled in at our packing grounds a complete line of deciduous fruit and ornamental trees, small fruits, grape vines, and roses. Write us at once for our Surplus List and Special clean-up Prices on this stock. The trees are in perfect condition and ready for immediate shipment.

OLIVES

We have a fine stock of Mission and Manzanillo, and every prospective planter should get in touch with us before placing his order. Trees can be delivered either from our Fresno or Los Angeles Nurseries. Special quotations for stock in any quantity.

Our Book for Planters

"Roeding's Practical Planter's Guide, the Result of 30 years' experience in California Horticulture," contains complete cultural instructions with illustrations showing "before" and "after" pruning. The regular price of the booklet is 25c, but if you send us your list for prices and suggestions, we will send you a copy free. Write us today.

Illustrated Catalogue Free

for the season 1914-1915 is FREE, fully illustrated. Contains 60 pages and briefly lists and prices all stock carried by us, consisting of over 2000 varieties of trees, vines and plants. A copy will be sent free to any address upon request.

large to protect themselves against fluctuation in prices. These dealers are not important factors in increasing the per capita consumption. The margins charged by the retailers may run as high as 75 per cent above the cost in some cities, while in others it drops as low as 20 per cent.

Fluctuation in Carlot Jobbers' and Retailers' Prices

We desire to bring out another phase of the orange distributing business. It relates to the fluctuations in the jobber's, retailer's, and consumer's prices. The impression is widespread that the consumer's price does not fluctuate with the retail purchase price, and that the jobber's price to the retailer does not fluctuate with the price paid the producer. In order to determine the facts we have taken the carlot, the jobber's and the retailer's prices in 12 representative cities for one year and have charted the fluctuations in the respective prices.

The three prices taken as a whole do follow each other with almost exact regularity, and this must necessarily follow where the competition between the different wholesale and retail dealers exerts itself naturally. There are many exceptions to the general rule where the retailers or the jobbers maintain a somewhat uniform price throughout the year and especially where the jobbing and the retail prices are held abnormally high after the producer's delivered price has been reduced. This is especially true where the fruit is carried as a side line to meet the ordinary demands of the customers of a store. It may be more true in the country districts where there is not so active a competition in the sale of fruit and in markets where the forces of competition do not operate naturally. When the producer's price is low the consumer reaps a benefit only when the price of the jobber and retailer is reduced correspondingly.

No attempt will be made to interpret these figures at the present time except in a general way. The industry is vitally interested in seeing the cost of production and the costs of distribution reduced to a minimum by a more efficient organization of every distributing process and by a better understanding of the problems of each factor, to the end that a more effective cooperation between them all may be brought about. The industry recognzes that the distribution of a food product is a series of complex operations; that the railroads, the jobbers and the retailers, each perform a vital economic and social service in bringing the producer and the consumer together; that each should receive a fair return for the service he performs, and that a more efficient and direct service should be the aim that each should strive for if the basic factor, the industry which furnishes the fruit, is to prosper: It also recognizes that many of the conditions under which food supplies are distributed in the cities are created for the jobbers and retailers by large economic forces and by the requirements of the consumer, which are beyond their power to influence or control. But if the producer, as well as the distributing agencies, the railroads, the jobbers or the retailers are not effectively organized, or if they are not following sound merchandizing practices, their overhead costs are excessive and they impose an undue burden on both the producer and the consumer, consumption is restricted, the investment of the producer is jeopardized, and the stability of the industry is threatened.

We may suggest in a general way some of the conditions which seem desirable to be brought about.

Conditions Which the Producers Must Meet

First, on the part of the producer it is essential that he furnish the jobbers and retailers a uniform supply of citrus fruits of dependable grade and pack and of good keeping quality if a staple merchandizing business is to be developed by either. Variable grades, packs, and keeping quality increase the hazard of fruit merchandizing, and the jobber and retailer must necessarily add a margin large enough to cover these risks. Uniformity in grades and supplies stabilize trade and the margins naturally adjust themselves on a lower level. This is a fundamental requirement in fruit merchandizing often overlooked by the producer, difficult to handle on account of the large number of groves involved, but one in which progress is being constantly made. The producer must utilize every known agency under his control to produce a higher grade of fruit at a lower cost. To this end he is also making progress with the aid of the state and federal governments, though there is no immediate prospect that the cost of production will be reduced. Rather are they growing higher on account of the higher costs of material and labor. It now costs the producer an average of $1.29 per box for oranges and $1.90 per box for lemons to produce the fruit, handle it, and place it on the cars for shipment.

Transportation Conditions

Whether the cost of transportation will be reduced only the future can develop. At the present time the industry is shipping the fruit under rates established by the railroads and sustained as reasonable by the interstate commerce commission. They represent $1.00 per 100 pounds on lemons and $1.15 per 100 pounds on oranges. The orange rate represents 20.5 per cent of the consumer's dollar based on the representative prices of 1914. The average haul of oranges is approximately 2,500 miles, absorbing thereby a higher proportion of the consumer's dollar than other products contribute where the sources of production and consumption are closer together.

Position of the Jobber

The position of the jobber in the distributing system is widely misunderstood. To the so-called middleman the high cost of distribution is popularly ascribed, and there is a widespread agitation that he be eliminated. This investigation shows that 8.2 per cent of the consumer's dollar, or a mark-up of 14.2 per cent, represents his margin and that he is not the leading factor in the cost of distribution. The jobber performs a distinct function that must be performed by someone in assembling the fruit in the towns and cities, in developing trade with the countless retail dealers in the rural districts and cities, and in blanketing the credit and other distributing risks for the producer. His function is somewhat similar to that of the banker, who furnishes the money through which trade can be conducted, except that his business is not so highly organized, it is not under state and federal direction and control, the abuses are not so easily corrected, and they are therefore featured in the popular mind out of proportion to their true relation to the business of the middleman as a whole. The jobbing interests of the country owe it to themselves to see that the unprincipled middleman is eliminated; that practices of every kind that are unfair to the producer are cut out—that any ractice that slows down the natural forces of competition and thereby reduces consumption be brought under strict regulation. In no other way can the legitimate function of the fruit jobber in bringing the producer and retailer together be properly developed anl safeguarded against radical legislative action that may in the end be undesirable for both the producer and the consumer alike.

We would suggest that the jobbing interests of the country seek the cooperation of the bureau of markets of the United States department of agriculture to the end that a cooperative systematic investigation of all the conditions surrounding the functions and the practices of the jobbing trade be made. This investigation would reveal the waste in the wholesale distributing system and it would furnish the basic facts on which the jobber's relationship to the public and to our modern industrial life could be more clearly understood.

Other industries, such as the cold storage interests, the railroads, the handlers and shippers of fruit, poultry and eggs have been greatly benefited by cooperative investigations with the constructive branches of the federal government. It is too much to hope that such a cooperative investigation would have a far-reaching influence on the economic phase of the wholesale relationship of the jobber to the producer, the retailer and to the public at large.

Retail Cost of Distribution

This investigation brings out clear-

San Dimas Citrus Nurseries

Citrus Trees Exclusively

For 25 years we have been growing citrus trees exclusively and successfully. The fact that we are and have been for many years the largest citrus nurseries in the world would seem to be sufficient proof that we know how and do grow better trees than anyone else.

That our trees are giving the greatest satisfaction is evidenced by the large and increasing number of people who insist on Teague trees—and will plant nothing else. Our success is due to quality—the result of concentration upon one subject. We ship to all parts of the world—one of our largest and most recent shipments being to South Africa.

It Pays To Buy Teague's—The Best Trees

In buying any kind of a tree it is of the utmost importance to buy the best and this is if anything more important with citrus trees because they cost more. There is more money involved, and a few cents on the first cost of a tree is of very little consequence when you take into consideration its future care and future yields.

Buy your trees from those who have spent years in the business, and who are in a position to back up their guarantee.

We Grow All The Standard Sorts

It doesn't make any difference how large or small your order may be, we can take care of it in good shape. We can supply all the standard sorts in Oranges, Lemons and Pomelos—as well as many specialties that are in limited demand. Write us about what you are planning on setting out and get our suggestions. We are always glad to advise with prospective planters free of charge.

Write for Our Book, The Principles and Practices of Citrus Culture—Price 25c

It is handsomely illustrated and deals exhaustively with the subject from seed to market. Describes methods of propagating, budding, cultivating, irrigating, packing and shipping. The expense of getting out this book is so great as to prohibit free general distribution. It is worth several times the price, but will be sent postpaid to any address upon receipt of 25 cents in stamps.

ly that the most important factor in the cost of distribution, next to the cost of transportation, is the retail distribution, which represents one-third of the consumer's dollar. The amount of the consumer's dollar represented by the gross retail cost is four times the amount represented by the jobber's cost. It is more than the proportion absorbed by the cost of transportation and the jobber's cost combined. It is nearly equal to the amount returned for the fruit on the tree, which includes the cost of production and grower's profit and the cost of picking, hauling and packing.

There are several classes of retailers engaged in the fruit business; the fancy fruit store, the high class grocery store, the average grocery store, the chain store, the fruit stand and the fruit vender. The present retail system is largely the result of the demands of the consumers which each class serves. A retailer's overhead charge includes store rent, salaries and wages of employes, interest on capital, cost of purchasing, resorting, displaying, storage, and delivering goods, taking of orders, telephone, light, heat and other store expenses, losses from decay and deterioration, taxes, insurance and other necessary expenses. Most of the expenses are also included in the jobber's overhead costs. Where the fruit is sold from push carts and street stands, some of the expenses are eliminated or are reduced. In the fancy fruit stores and in the large grocery stores which cater to the well-to-do, these overhead charges are naturally larger. They make up the cost of the service which the consumer demands, and the cost of the fruit is only one of the factors in the consumer's price. The simpler the service, the less the overhead cost, and in those cases the consumer pays primarily for the fruit with only a comparatively small overhead charge added for service and profit.

The retail distributing business is a vital line in the chain between the producer and the consumer. The desire for fruit is awakened by suggestion, by seeing attractive displays of fresh, luscious fruit in the windows of the store, on the counters, or in other forms of display. It is stimulated by the attractive fruit stands and by the push carts laden with golden oranges, by advertising in the magazines, the newspapers, street cars and other advertising mediums. It is promoted by prices which bring the fruit within the reach of the average consumer. The retailer, more than any other factor, creates this appetite appeal, because he comes in direct contact with the consumer, and he stimulates or retards it by charging reasonable or exorbitant prices.

The retail dealer must therefore know how to make artistic fruit displays if he is to catch and sustain the interest of the consumer. The fruit must always be fresh in appearance, free from decay and appetizing in every way, and the price must be reasonable. If the appeal to the consumer's appetite is not strong and continuous, the retailer does not increase the consumption. If the price is not reasonable it cannot be purchased by the average consumer. If the sales are not rapid, the fruit wilts, loses color, decays and is a drag on the hands of the retailer. Under these conditions the retailer, unless he is a fruit specialist, does nothing to encourage sales. The unattractive fruit is destroying the desire on the part of the consumer, the losses from bad condition are excessive, and the retailer must add a margin large enough to cover these losses and risks. Attractive displays and quick sales, at a reasonable margin of profit on each transaction, increase the per capita consumption and make a satisfactory profit for the dealer at the end of the year. Any other system jeopardizes the interest of the producer, reduces the volume of business of the jobber, and keeps the net profit of the retailer below what it otherwise might have been.

The retail fruit business needs the same careful investigation as that suggested for the fruit jobber, with a view to improving the entire retail business system, to developing better methods of creating an increased consumption, and of putting the entire retail system on a basis which will make it the most vital factor in handling the rapidly increasing fruit crop. To accomplish this end the average retail fruit dealer needs the coopera-

tion of the producer and the jobber. The consumer demands a service that imposes a heavy overhead charge on the retailer's operations—a condition which the producer does not usually appreciate. In all of these operations the consumer is king. By gaining his confidence and serving his best interest the interest of the producer, the jobber and the retailer are assured. Without the interest of the consumer, all merchandizing efforts must fail. The aim of every factor in the fruit business should be to stimulate the desire of the consumer for fruit, and then to give him an attractive, fresh, wholesome supply at a price which pays a reasonable profit to every factor involved, and yet be well within the consumer's reach.

Whether the jobbing and retail fruit business is organized along economical and efficient lines, whether the purchasing, the deliveries, the credits, and other features of the business are handled with the fewest number of steps and with a minimum of economic waste, and whether the handling of the business by the producer, jobber and retailer serves the best interest of the consumer, the author is not prepared to say. It is recognized that both the wholesale and retail systems are products of modern industrial and social life and that changes in the system must progress slowly. The facts outlined in this discussion are not presented in a spirit of criticism, but in the hope that they may lead to investigation and to a clearer understanding of the different phases of distribution, that they may induce the jobbing and retail fruit interests, the railroads and the producer to study his own problem more carefully, and to study problems of every other factor as well, to the end that the fruit distributing system from the producer to the consumer may be made more stable, more direct, more efficient, with every wasteful step and process eliminated and all handled to gain the confidence of the consumer and to serve his best interests.

COIT'S BOOK

The Macmillans announce that Professor Coit's "Citrus Fruits" will be ready during the present month. We have waited long for a manual of citrus culture which would be of value to California's greatest industry. Professor Coit and the publishers have been working on this book for the past two or three years. The Cultivator has arranged to supply this book. Announcement will be made within a short time as to its price. The book has 186 illustrations and touches upon the history and development of the industry, especially in Southwestern United States, citrus geography, botany, varieties, nursery stock, improvement by breeding, sites and planting, cultivation, fertilization, cover crops, and in fact general cultural directions. It is a complete treatise on citrus fruits.

"ANYWAY, GO"

One thing which California is getting out of its expositions is a mass of advertising. Every magazine is giving pages to illustrations and well written articles. Every paper is calling attention to it and urging its readers to attend. From The Farm and Home, published at Springfield, Massachusetts, we quote:

"Simply marvelous is the San Diego Exposition which opened New Year's day. Even greater in its wonders is the magnificent San Francisco Exposition. Both run through the year. Don't miss them. Go out one way and back another. Get acquainted with your own land and its people. No effort or sacrifice is too great for this trip. Make it before spring's work comes on, if possible. You may be too busy or unable to go later. What an auto ride! Two boys will go from Massachusetts to California and return by motorcycle. One of my friends plans to walk from Chicago to Frisco! Anyway, go!"

WAR

Here's one the Gower (Missouri) Enterprise borrowed somewhere and forgot to return: "A Western farmer went and sowed a field to German millet. The Russian thistle crossed the road and started in to kill it."

CITRUS Trees

IF you are going to plant ORANGES, LEMONS or POMELOS this year you owe it to yourself to get the best stock obtainable. "R. & W." trees ARE the best and will probably not cost you but a very little more than inferior trees NOW and in the long run you'll find them much cheaper because of the QUALITY and QUANTITY of fruit they will bear.

YOU CAN AFFORD to discriminate in order to secure results like those obtained by Dr. DUNGAN. He is only one of thousands of satisfied "R. & W." customers.

READ THIS LETTER —

Exeter, Cal., Dec. 1, 1914.

Mr. Geo. C. Roeding,

Dear Sir: In 1905 I purchased from the Roeding & Wood Nursery Co. 2000 Washington Navel Orange Trees to plant on my ranch one-half mile north of Exeter. I consider my orchard one of the best, if not the best for its age in this locality. The trees have made a remarkably fine growth, and all of a uniform size. The quality of the fruit has been exceptionally fine. I know of none better anywhere around here. Of the 2000 trees there is not one but what is the best type of Washington Navel, in fact I am continually being asked by nurserymen, if they cannot cut buds from my orchard.

The orchard began bearing at three years of age and each year since has shown a substantial gain over the preceding year. I estimate my crop this season at 4000 packed boxes.

(Signed) DR. J. F. DUNGAN.

WRITE US TODAY, stating what you are thinking of planting and we will be very glad to advise with you fully free of charge. Being in close touch with market conditions we are in a position to counsel with our customers as to the best varieties of not only citrus but deciduous fruit trees to plant.

Olives

We have a splendid stock of Manzanillo, Mission and other varieties of fine olives. Our trees are grown from buds of select strain, the kind that produce premium fruit. Write for a copy of our "Bulletin on the Olive," which will be sent free to any address upon request.

Planting Guide

Our new book "Roeding's Practical Planter's Guide" is the result of over 30 years' experience in California Horticulture. It tells how and when to plant all kinds of fruit and ornamental stock and gives complete instructions on pruning. The price of the book is 25c postpaid.

The Joys and Trials of Ranching

By Mrs. J. R. Moles Before Claremont Pomological Club

THE subject of this paper as it was given to me being "The Joys and Trials of Ranching From a Woman's Standpoint," I judge it is conceded that ranching by a woman is somewhat different from the same occupation indulged in by a man.

You will pardon me if I seem too personal in my remarks, since I have been but one woman. Others with different ambitions and desires and dispositions and with different experiences may hold views differing materially from my own.

Occasionally one hears a remark from a woman on the unfairness with which our sex must make their choice of a life occupation. Having in fact no choice, if she marries, she must always accept that which comes to her, usually that of housekeeping, while men may select the work toward which their hearts incline and for which nature has best fitted them. But I feel safe in saying that nine women out of ten prefer homes, and children to care for, to a business career. The hearts of most normal women incline toward that one occupation. For such women, what is commonly known as men's work comes hard.

We are handicapped in the business world, both by inheritance and by training, and in the business of ranching, by our skirts. You will not all agree with me. Some of you think women are as sharp in business as men, that in fact if the men had followed our advice things would have turned out much better. But as a matter of fact, because for generations we have thought in spoonsful and cupsful, we must naturally now think in small figures and because we are everlastingly looking for dirt—we have grown petty along some lines.

The business training which most women in ordinary circumstances receive in the home consists of the management of the small household economies. We plan to buy three cans of coffee instead of one, because by so doing we save ten cents on the three. We usually make one can of corn by taking a dozen. Our wildest flights in speculation consist of buying a bag of sugar at the time it is just on the point of going up. We darn and patch and turn and stitch. We use so much time and strength to save a few pennies to help the good man along. All this makes good women of us, it's fine for our character. But when by circumstances we are forced out into the business world to look after our own and care for those dependent upon us, we are timid and fearful and ignorant in dealing with large issues and large sums of money.

I do not say but that by nature some are better fitted to cope with the problems of finance than others, but to the majority of women who spend a number of years caring for husband, children and home, and then suddenly find themselves obliged to do double duty, to such women business comes hard.

I speak as though it were always a woman of middle life and with a home of her own still to care for who takes up this business of ranching. It is usually so. I can recall no instance where a young woman, single, just out of school and ready for her life work has chosen the occupation of ranching.

I suppose no one thing is harder for a woman, in search of her bread and butter for the first time, than meeting men in a business way. From our little girlhood we are kept in the home, off the streets, out of offices, kept away from any place where men congregate. Most of us remember we were not to play with rough boys, because we would become rude. If we were sent to the store we were to do our errand and come home. A railway station was no place for a little girl by her self, and so on, until we instinctively draw back when having dealings with the masculine part of creation.

We also have a foolish notion they are amused at our ignorance and mistakes. I want to say right here that in my own case, had it not been for the unfailing courtesy, generosity and kindness of men as I have met them in my business, I should have been lost. This is a common remark heard by all of us: "It is so hard for a woman alone, men take such advantage of her." I do not believe it. I have never failed to receive from men the utmost courtesy and fair dealing except when I so far forgot myself as to misuse my privilege as a woman and demanded more than my right.

There are objections to ranch life for a woman, that do not hold in some other business pursuits. We are not dressed for it, our skirts impede us and in wet weather become dirty, bedraggled and uncomfortable. Our flimsy hats and long hair catch in the branches and harrow our feelings. Our strength is not equal to most of the tasks. In our homes we are accustomed to smooth floors on which to walk. We plan our homes to avoid as much lifting of our bodies as is possible. We have as few stairs as possible. Every convenience for lightening our labors is ours. Then to tramp over the uneven and soft ground of a ranch, up and down rows of trees, back and forth, and under trees, becomes unutterably wearisome.

Our strength then being unequal to the many tasks, we must turn to outside help for each little thing, and finding help being a real difficulty for men, becomes at times almost an impossibility for women. So often the men who care for our places desire to keep their teams busy and do not wish to do the hand work, and no man can afford to wait on these little scattering jobs, so it means that if we can find help at all that it is unskilled labor that we must depend upon for such work. Many a little job that we could very well do for ourselves, because of lack of strength and household duties, must be turned over to some boy or inexperienced man. The work then is not always done satisfactorily because of our inability to stay by it.

Adhesion

Dip a glass rod into a beaker of Zerolene. See how Zerolene clings to the rod. This is ***adhesion***—the quality that enables Zerolene to cling to the bearing surfaces under all conditions, protecting the parts from rub and wear and grind. Zerolene lengthens the life of your car. It keeps down repair bills.

ZEROLENE

the Standard Oil for Motor Cars

Standard Oil Company (CALIFORNIA) Los Angeles

I once heard a rancher say, "In order to make a ranch successful a man needs to go out every day and ask the trees if there is anything they want." In other words one needs to live with the trees, to know each one individually, to know its history, watch for symptoms and for effects of treatment. Whatever we are looking for is what we see, and ranchers' eyes should be trained to see and know scale and all injurious insects, however minute. And how can women do this, with home duties calling? And it is rare when hired help will take an interest. A man who is hired to plow at 50 cents an hour, plows. What does he care for the happenings of a certain tree? How easy it would be for the general man of the place to stop his team to examine a doubtful tree or watch for developments while his team is resting, but usually he feels he cannot spend the time. Because of her limitations it is impossible for a woman to carry on a ranch as economically as can a man.

The smudge pot also has come, which makes our task the harder. While it is possible to get reliable men who understand the business to attend to the work of firing, yet in many cases they are young men, in our case students, and it does not seem to me fair or right to throw the responsibility of several thousand dollars worth of property wholly upon their shoulders. That means that we go with them, and stand around in the cold or do what light work we are able. Because we have been favored in our lives this too is hard.

I could string out our trials endlessly I suppose, but I think I will lump the rest. These are not peculiar to women, but because we are women perhaps they are harder to meet. The floods for instance, when the men are digging to stem the tide and dragging stone and trees and working night and day to save us all, we stand helplessly by unable to take our share, or at best only able to carry coffee and food to them, a very easy task. Then there are the floods and drouth, the hot winds and cold, Santa Anas, and northers, freezes, hardpan, plow sole, root knot, gum disease, dieback, mottled leaf, gophers, scale—black, white, brown, grey, yellow, purple and those of the remaining hues of the rainbow, and the fear of the mealy bug—all these and many more.

It is with pleasure that I turn from this dark picture of ranch life to the other view of it.

After all some of the very things that make this life hard for a woman act as a tonic and educator to her. To woman as to man orange ranching is healthful, interesting work. An orange tree is a very wholesome companion, teaching us many lessons, both moral and educational.

One of the distressing things about housework is its habit of never geting anywhere. We never seem to arrive.

An orange tree responds so cheerfully and quickly to good care and advice that a woman finds encouragement that she does not always get in her own work at home. The fresh air, and blue sky, the birds and the growing things inspire the soul that has grown morbid and despondent from grubbing too long after dirt. Because she has become petty from dwelling so long on her own little affairs in the home, from being shut up with her own little self and her own little thoughts within her four walls, because of this—this ranch life is refreshing, invigorating and broadening, wholesome alike to body and soul.

It has been said that women have no sense of proportion. There again are the four walls responsible; they destroy our perspective. But out in God's world, out among the growing things, there is the only place to strike a true proportion. The little annoyances that seemed so big and of such portentous consequences in the less pure air of the more or less darkened house, assume their right level and significance. What does it matter if the cake did fall? One doesn't really need cake anyway, and the smell of the mellow earth is so wholesome. What matters it if a bit of work in the house got crowded out? There is always tomorrow and all the time there is out among the trees. An orange tree is such an honest old soul. It never cheats, is always grateful and appreciative and is always cheerful, bobs up serenely after every blow and keeps a smiling front to the world. I find myself becoming reconciled to all mankind through association with these trees.

Besides our association with these good characters, we also must associate more or less with men. It is good for women to be obliged to come into contact with good, strong, intelligent men. We need to; we become too effeminate when left to oursleves; we shrink too much from hardships and it toughens our moral fibers to do some of the things men do and to meet them in a business way. There are many moral lessons to be learned in the business world, and we need to learn them. I have often heard that men dislike to do business with a woman. And why? Because we aren't honest to deal with. We have been taught the small end of the load is for us, since we are women. And we are surprised when dealing outside of our own little world that we do not by rights have the best end of the bargain. Our own husbands and fathers and brothers make things easy for us, let us have the easiest jobs and the biggest rewards and it is hard outside of our homes to adjust ourselves to strict business principles. We labor under the delusion that to be courteous to us all men should give us more than half. Both in the actual growing of products and in all money transactions connected with ranching do women learn that most wholesome lesson of giving value received.

One of the pleasantest by-products of orange ranching is our Pomological Club where we meet men and women with one common interest and where we women hear ranch and business talk that we are unable to hear elsewhere.

Again, think what branches of education we take up in studying conditions on a ranch; botany, chemistry, biology, zoology, geology, we made a fine stone fence of some of our geological specimens), astronomy (studied on smudging nights between acts), mathematics, philosophy (we made quite an ardent study of that branch after the freeze), and yes, I think I may say we have touched on theology. Quite a liberal education is it not?

Take it all in all, probably there are no more trials in ranching than in many another business, and surely a more joyous occupation would be hard to find.

John Deere Implements

John Deere Syracuse Hillside or Swivel Plows

Nos. 821, 822, 823, 824 and 825

The plows with ample throat room and close fitting joints to prevent clogging. Do equally good work on hillsides or level land. Moldboards of new design, turning furrows smoothly up or down on hillside land. Long moldboard—a clean furrow slice. Option of white iron or tempered steel moldboards.

Write us for information on the Syracuse Hillside or Swivel Plows Nos. 821, 822, 823, 824 and 825. We will send it to you free.

John Deere Spreader

The Spreader with the Beater on the Axle

The beater—the business part of a spreader—and all its driving parts, is mounted on the rear axle. This is a patented feature. You cannot get it on any other spreader. Here is what the beater on the axle means to you:

It means: No clutches to give trouble—all taken off.

It means: No chains to break or get out of line—all thrown away.

It means: Less than half the parts heretofore used on the simplest spreader—some two hundred parts are done away with.

It means: Manure is not thrown on the axle—straw and trash cannot wind around it.

It means: You get big drive wheels and a low down spreader, without stub axles—that means traction and strength.

It means: Drive wheels back out of way when loading—you see where you place each forkful.

The John Deere Only Hip High

The top of the box is only as high as your hips. The John Deere Spreader is easy to load. You see where you place each forkful.

To start spreading, you pull back the lever at the driver's right—that's all. A boy can operate it.

Call on nearest John Deere dealer and see the spreader with the beater on the axle. Write for "Farm Manures and Fertilizers", a valuable text book free.

R. & V. Gasolene Engines

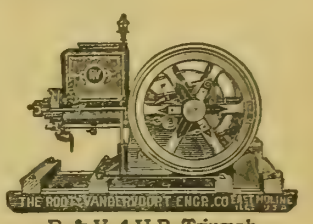
New Triumph One Horse Engine. Just the engine for light work about house and barn, such as running washing machine, pumping water and operating other small machines. Saves every member of the family work and worry.

A reliable, efficient, low priced but high grade engine. Easy to start, smooth running, requires no attention when in operation, economical in use of fuel and perfectly safe in and around buildings. All working parts are back of the fly wheel out of the way—a neat outfit in every respect.

R. & V. Triumph Engines for All Farm Machinery

The R. & V. Triumph line of engines is also made in 2, 4, 6, 8, 10, 12 and 16 H.P. sizes, stationary and portable. Every farm can use one or more of these engines to advantage.

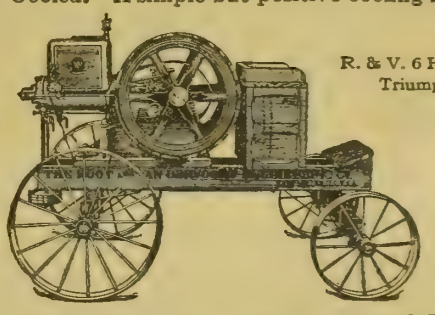
They are dependable gasolene engines—always develop rated horse power.



R. & V. 4 H.P. Triumph

An extra ring over the piston pin prevents scoring and ruining cylinder. This is an unusual precaution for lengthening the life of a gasolene engine. This careful attention to details is followed in constructing every part of the R. & V. Triumph.

Hopper Cooled. A simple but positive cooling system.



R. & V. 6 H. P. Triumph

The gasolene tank for every R. & V. Triumph Engine is most conveniently and safely located—on practically all of the stationary engines it is in the sub-base.

Write for free booklet "Letting Gasolene Do It." This book tells how you can save time every day in the week by using an R. & V. Triumph Engine.

Better Farm Implements and How to Use Them

FREE BOOK Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, discs harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X-111.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

COVER CROPS

This is a good season of the year to consider cover crops. It is some months before planting time, but this is plowing under time, and it is a good time to gather information which will be of value next September. Note we say "September," for this year has proven more than ever before that it is the early planter who secures the heavier crop. The citrus experiment station has shown this most emphatically this year. It has plots planted the last of September, the first of October, in November and in December, and the earlier planted seed which secured good root hold during the warm fall weather show many times the tonnage of the later planted. As to the best crop to use for green manuring, that depends so much upon the soil and other conditions that each one must work out his own problem.

LIVE STOCK MEN TO MEET

The American National Live Stock Association, of which H. A. Jastro of this state is president, will meet in San Francisco next Wednesday,Thursday and Friday, March 24-26. This is the 18th annual convention of this association. The membership is made up of cattlemen west of the Mississippi. This association has been a great factor in securing the rights of the cattlemen. One of the principal discussions in the San Francisco meeting will doubtless be of the national quarantine and the work of the department of agriculture in connection with the foot and mouth disease. The department has been severely criticised by many live stock associations, and it is presumed the matter will be threshed out at San Francisco.

March 23, the day preceding the opening of the national association, the California Cattlemen's Protective Association will hold its annual. A banquet will be held on the evening of the 23rd at the Palace Hotel. Secretary F. J. Sinclair, 628 Montgomery street, is now making reservations for members and others who wish to attend. The banquet is informal and all are requested to come in business suits. All railroads have made a fare and a third rate to these conventions.

SIXTEEN TO ONE

It was our pleasure this week to have a few minutes conversation with Geo. T. Powell of Ghent, New York. For many years Mr. Powell has grown apples and other fruits in the Hudson River Valley. He has not only grown apples; he has grown good ones; this through bud selection. Of course bud selection is a modern term, at least we have generally so regarded it, and perhaps as used in California it is modern. The principles which many are now working upon have been recognized for years, in fact, Mr. Powell told us that more than 30 years ago he made an effort to produce apples, everyone of which would be the equal of one particular tree in his orchard. This apple was the Southern Beauty. He cut his own scions, delivered them to his nurseryman and asked for particular care of those particular trees in grafting stock. A few years later when that nurseryman was in charge of the horticultural division of the state fair he ruled out the fruit of those particular trees because they were too large and too fine looking to be Southern Beauties. In other words, he thought they were some other variety. He was forced to readmit the fruit and they won the premiums in their class. Mr. Powell remarked that most fruit growers at that time considered a bud a bud.

The same is true today at least as to a limited number of our fruit growers. If a bud is taken from a Southern Beauty, a Spitzenburg, or Bellflower, the fruit will ordinarily come true to variety, but the keeping of records has shown that we do not always get productive trees.

Another thing Mr. Powell referred to is the fact that these more productive trees as a rule are the thrifty growing trees and the most resistant to insects and to unfavorable weather conditions.

Mr. Powell's observations not only cover apples, but many other fruits, including currants of which he has produced great quantities. From a plantation of 20,000 bushes, averaging about one quart of fruit per bush, proper selection produced a plantation which averaged over 16 quarts per bush. From these facts and others connected with the cultural side of orchard work Mr. Powell enforces the lesson that greater economy of production means greater profit and his idea is that the farmer's profits must be secured largely through these small economies.

Mr. Powell is the father of G. Harold Powell who is manager of the California Fruit Growers' Exchange and who has done such magnificent work in giving aid to the citrus industry of this state through his citrus investigations while connected with the department of agriculture.

CONSIDER CAREFULLY

When the Civil war began in 1861 trade conditions the world over suffered. Of course the United States, especially its southern war zone, suffered most, but as one example of the suffering caused by this war in Europe may be mentioned the fact that owing to the destruction of commerce and the inability of the cotton mills of Lancashire, England, to secure supplies for their mills, other portions of England were compelled to raise $9,500,000 to feed the starving mill operatives. The European war now in progress is causing untold suffering in the war zone, and to a degree the interests of this country are taking their share of the losses. This is especially true again in the cotton industry. The deepest suffering is felt by the producers because of the cessation of commerce and the inability of the mills to operate, and use the products of Southern farms, but the point is that trade is affected.

Wheat growers, and perhaps a few of the large iron mills and ammunition factories, are prospering, but the unfortunate conditions generally are forcing many business men to look disaster in the face. The orange growers of the Mediterranean have their markets almost entirely closed. Even some of their fruit has been used as ballast in ships coming to this country to be returned with wheat and ammunition. Florida's fruit has almost been a drug on the market; grapefruit is not even returning freight charges. The Californian is little better off, though his fruit has been commanding longer prices than has that of any other shipper.

But the naturally low prices are causing much restiveness and the grower is asking why he is not receiving a greater proportion of the consumer's dollar. Even the trade must admit his proportion is too small. The table given by Mr. Powell in his address before the Fruit Jobbers, and published in this issue, shows that the producer is receiving 26.7 cents of the consumer's dollar and the retailer 33.3 cents. This the grower maintains is an unjust division. We believe he is correct and that the grower's percentage must be increased, and in order to do this the retailer's percentage must be reduced, thus inducing greater consumption.

But how may this be done? The asking is easier than the answering, and therein we hope the Cultivator may be pardoned for issuing just a word of warning. The world's financial condition, as pointed out above, has never been more strained. Is it wise then for California producers, 3,000 miles from their market, to upset existing conditions until they have reasonable assurance that they can be bettered?

The fruit grower is dealing with a product somewhat different from that of the tobacco trust, the Standard Oil Company, the breakfast food companies, and others handling products which have a general demand year in and year out and are, to a certain extent, non-perishable, also practically 100 per cent under control of one organization. At this time, and for the next three months, California will be shipping close to ten carloads of citrus fruits every hour, day and night and Sundays included. If the suggestion of some growers is accepted and a great distributing and retailing trade built up, how may business of such magnitude be handled during the eight or nine months of the year in which citrus fruits to be marketed will not be one-fourth the amount being marketed at the present time? It is possible also that a disastrous freeze might seriously affect such an organization. Presumably, as Mr. Waterbury says in his article on another page, we are now ready to maintain proper temperature in our orchards and we will never be affected as we were in the freeze of 1913, but trade conditions might be so upset that the great overhead expense of such an organization might be most embarrassing during such a year.

To meet this objection, it has been suggested that possibly a great federation of all California's cooperative associations, that is, in addition to citrus fruits, raisins, nuts, dried fruits, olives, etc., might be formed which could arrange for a great chain of distributing centers for California products. Their interests are very similar; the season could be covered and a 12-months' business could be developed. The magnitude of such a business would call for brainy men, and in this connection we may refer to the fact that a New Yorker told us within the last month that in the large trade centers California's greatest cooperative organization, the Exchange, has a reputation for keen business methods and a thoroughly organized working force, second to none, and this includes Standard Oil and other highly organized businesses. If California has done this with one organization, has she not the ability to do it with another?

The citrus growers of California have certainly shown their ability to finance a great producing organization. This has aided them in securing supplies used in producing fruits at such a price that even 26.7 cents of the consumer's dollar has enabled them to live. But the burden is becoming heavier as the producers' prices are lowered. Now, how will this burden be lifted? The Cultivator has no answer; we do not believe anyone else has yet, but it is the duty of all to look at the question squarely. Of course the jobber and the retailer and other connections of the fruit trade are inclined to say, "Let us alone." But the citrus industry is too great and the men engaged in it are too big to submit to unjust treatment. If the present methods of distribution are unjust or insufficient and will not permit the producer to secure a living wage, then he must either retire from business or revise his business methods. And this should not be along the line simply of "starting something."

Behind each tree is our guarantee

THE SILVA BERGTHOLDT CO. CALIFORNIA

YOU WILL HAVE TO HURRY

It is only a matter of days now and then—

YOU LOSE A WHOLE YEAR FOR PLANTING FRUIT TREES.

Send today for our revised FEBRUARY STOCK LIST.

We are fruit growers and shippers as well as nurserymen. Our buds are selected for propagating only from parent trees having the best record for quality of fruit and productiveness, thus insuring a pedigreed tree. Our years of experience, knowledge and observation as nurserymen and fruit growers are at your service. We show you how to succeed.

If you already know

just what trees you want, do not wait for the STOCK LIST. Send in your order. If the trees you want are still in stock, your orders will be immediately filled.

Don't Delay
Order today.

Agricultural News Notes of the Pacific Coast

Northern California

Sutter County will withdraw from the Anti-Debris Association.

The state engineer estimates that California has 24,589 irrigation pumping plants.

Antioch, Contra Costa County, shipped its first asparagus during the first week of March.

A fatal malady is affecting sheep on some of the ranches near Red Bluff, Tehama County.

The farm bureau of Yolo County is making an effort to stamp out hog cholera in that county.

Olive growers of California are making every preparation for observance of olive day, March 31.

Yuba and Sutter Counties will produce in excess of a half million dollars worth of wool this year.

A drainage project is being discussed at Dorris, Siskiyou County. It will reclaim 25,000 acres.

Humboldt County Dairymen's Association was addressed at its last meeting by Farm Adviser Christiansen.

An effort is being made to secure Champ Clark to deliver the principal address at the University Farm picnic.

At the last meeting of the Contra Costa County Poultry Association William Quental was elected president.

The largest irrigation project yet planned for northeastern California has been inaugurated at Calneva, Lassen County. The district proposed will embrace 200,000 acres, nearly all in Lassen County.

Irrigators of District 1500, located in Sutter County, are protesting against legislation which affects adversely the interests of their district. Mass meetings have been held in various parts of Sutter and Yuba Counties.

Central California

Maricopa, Kern County, reports heavy snowfall in the hills last week.

Orangecove, Fresno County, is greatly increasing its planting of orange orchards.

Wasco, Kern County, claims the record for largest rice field. One field has 1250 acres.

Melon growers near Turlock are making a general canvass for members of the new marketing association.

Monterey, San Benito and Santa Cruz Counties are uniting in their exhibits at the Panama-Pacific Exposition.

Peach growers near Kingsburg, Fresno County, are signing up contracts with the new cooperative cannery.

Monterey County is planning to invest $525,000 in state road bonds in order to encourage state road work in that county.

Tobacco growers near Fresno have contracted the first 75,000 pounds of tobacco to a new manufacturing plant to be established at Fresno.

Monterey County's gooseberries are becoming better known and if planting continues will make the county famous as a gooseberry center.

Because of the excessive rains of the earlier season farmers of Salinas, Monterey County, have been unable to plow until the last two days.

Corcoran, Kings County, is shipping cream to Los Angeles at the rate of $1000 per day or $365,000 per year, and new dairies are being started almost weekly.

Farmers near Turlock, Stanislaus County, are planning a cooperative marketing organization which shall be incorporated and organized with $75,000 capitalization.

Southern California

Walnut growers are already spraying for aphis.

Southern California's crop of lima beans is estimated to be worth $7,000,000.

Many Orange County sugar beet planters are replanting fields drowned out earlier in the season.

Brawley, Imperial County, reports very heavy shipping of peas. One day's shipments aggregated 325 sacks.

Citrus growers generally have planned a great day for next Saturday, which has been designated National Orange Day.

Lordsburg, Los Angeles County, has just installed one of the most complete warehouses for precooling oranges yet constructed.

A farmers' institute was held at Lancaster, Los Angeles County, last week. The principal points discussed were hogs and Sudan grass.

Santa Paula, Ventura County, is organizing a fair association and has arranged definitely for its first fair to be held during the present year.

Three cars of black eye beans were shipped from Puente, Los Angeles County, from Los Angeles harbor direct to the European war zone.

The first cotton from the Port of Los Angeles to be shipped direct to Europe went forward on the ship Moyune bound for Liverpool last week.

Citrus growers of Covina, Los Angeles County, are discussing the advisability of spraying trees to prevent black spot, which occurs in the navel end of much fruit.

The Santa Paula Walnut Growers Association held its regular annual meeting last week and elected Roger G. Edwards president, Mark N. Shedenhelm, manager and secretary.

The Coast

Eastern Washington pear growers are making a strong fight against blight.

The first county fair ever held in the Hawaiian Islands will be held at Hilo, November 26-28.

Estimates show Utah's output of wool at 1,170,000 fleeces, which will average close to seven and a half pounds per fleece.

Utah canners are reducing their contracts with growers for tomatoes because of holdover crop still on hand since 1914.

After years of contention over the waters of the Columbia River, Washington and Oregon have united in legislation which will protect the fish.

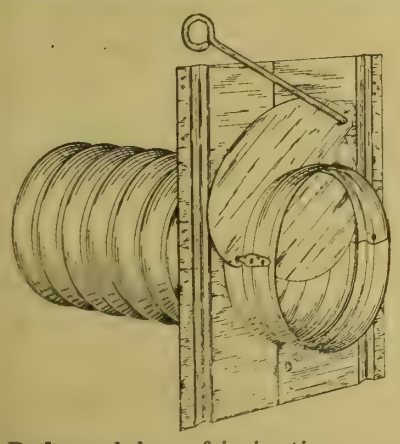
The Fifth Annual Pacific International Live Stock Exposition will be held at Union Stock Yards, North Portland, Oregon, December 6 to 11.

The Cow Testing Association of Pullman, Washington, recently met in annual session and decided to continue the organization, which has proved most profitable to dairying interests.

Washington live stock inspectors are instructed to notify railways that cattle, sheep and swine to be imported into the state must be accompanied by certificates of government tests for tuberculosis.

The dairymen of the Hawaiian Islands are making an effort to produce cleaner milk and all from healthy cows. The division of animal industry of the experiment station is aiding in the campaign.

The Utah experiment station has a White Leghorn hen which has been laying for five years. In that time she has supplied 816 eggs. This is the greatest number of eggs from one bird yet reported.



4-C Irrigation Gate

Reduces labor of irrigating.
Easy and quick to install or move to new locations.
Does not wash out.
Saves water and stops scalding of crops.
Can be removed, ditches cleaned with teams and gates replaced without loss.
DURABLE because made from RUST RESISTING

ARMCO IRON

Five other types of Gates. Culverts, Siphons, Flumes, Stock and Water Troughs.

LAMBERT STEEL HOOF TRACTOR in the Orchard

The One and Only Tractor for Ranches of All Sizes

When you get a Lambert you get the finest, most dependable tractor in the World. Nothing cheap enters into its construction. For instance, Timkin bearings are used throughout instead of ordinary bearings generally found in tractors. The Steel-Hoofs are another feature. They tend to walk over the ground instead of digging into it and at the same time afford a vise-like grip—no chance of slipping. The Lambert deserves a place on your ranch because it positively saves money. Less than a dollar's worth of fuel is required for a day's work and it easily does the work of 8 or 10 horses. That means absolute economy.

Call and let us demonstrate this Tractor —you'll be convinced it is the Tractor you should have.

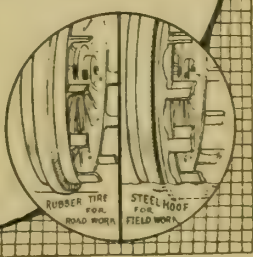
Oils, Etc.



Studebaker

WAGONS BUGGIES HARNESS

HERE'S WHAT MR. McINTYRE HAS TO SAY

I purchased my Studebaker in 1874 from Henry Brown of LeRoy, N. Y., and paid for it in wood. cut by myself.

The wagon drew all the stone that was placed in my house and barn. It has never been idle.

All the heavy work that is done on the farm today is done by the old wagon.

It is just as good as it was the day I bought it.

Peter R. McIntyre,
Caledonia, N. Y.

As good as the day it was bought —39 years ago

"All the heavy work that is done on the farm today is done by my old Studebaker I bought thirty-nine years ago."

Is it possible to say more in praise of a wagon?

Doesn't it prove conclusively that the best material and workmanship went into it?

—and doesn't it also prove that it pays to buy the best?

The best investment lasts the longest

Suppose you buy a Studebaker Wagon today — and it costs you a little more — but lasts a lifetime — isn't it, after all, the cheapest wagon you can buy?

Studebaker wagons are honestly built of the very best material. Not with the idea of building a *cheap* wagon but the *best* wagon.

— and, owing to improved methods of manufacture, Studebaker Wagons are really better built today than they were when Mr. McIntyre bought his wagon — and they cost less.

Durability — long service — have been always the watchwords of Studebaker.

That is why, within the last sixty-three years, Studebaker has grown to be the largest wagon builder in the world.

Studebaker Harness and Studebaker Buggies are built with the same integrity as are Studebaker Farm Wagons.

NEWELL MATHEWS COMPANY

ESTABLISHED 1886

LOS ANGELES AND MARKET STS. LOS ANGELES, CAL.

National Oil Engine

An engine which will burn fuel costing three cents per gallon, and at the same time is an engine with 90 per cent less parts, is the engine for the rancher to buy.

A LETTER FROM A USER OF THE NATIONAL OIL ENGINE

Kingsburg, Cal., Dec. 19, 1913.

National Steam Pump Co.,
Los Angeles, Cal.

Gentlemen:

I bought the first NATIONAL Oil Engine sold in this State. Any one wanting an engine let them come and see my 15 H. P. pulling a 6-in. centrifugal pump lifting thirty feet throwing two cubic feet moving one foot per second, using low grade fuel. I will answer any letter.

Truly yours,
(Signed) L. E. HURLEY.

We guarantee the saving in fuel expense and purchaser's own judgment will tell him that in doing away with 90 per cent of the small, delicate and complicated parts, springs, gears, etc., that he is getting away from engine trouble when he invests in a National. 1915 catalog now ready.

HOGS AND PIGS

Written for California Cultivator
By Sacramento Valley Contributor

EVERY farmer must figure out his plans to meet the requirements of his individual case, but frequently useful ideas may be gained from others.

In the Sacramento Valley is a farmer on a 40-acre irrigated farm who finds that after getting his alfalfa planted, his buildings made and other improving done, that hog raising seems best suited to his conditions. He has a number of hogs, and their increase during another year or so will be sufficient to make him a suitable income if he can grow feed for them and protect them from cholera. As to the latter, he believes in sanitary measures and vaccination if necessary.

And his scheme for the feed is to have alfalfa pasture available for hogs of all ages at all times, by fencing his alfalfa into fields that will permit some to be irrigated while others are pastured.

This makes alfalfa, gathered by the hog themselves, a sort of a base for the ration, but it is to be supplemented always by some grain to keep the growing pigs improving at all times, to keep sows with pigs giving the largest possible flow of milk and to keep all other classes of hogs in the best of condition.

Now labor costs money on this as on many other California farms. By this is meant that as far as the owner's family is concerned, "nobody works but father." It makes a big difference when a year's outgo for hired labor on a farm of this kind is compared to that where there are growing or grown children to do chores and other work at no cost but their board and clothes.

So in order to reduce the cost of labor it is planned to make the hogs gather as much of the grain they consume as possible.

A field of barley and wheat is growing now—and in April or May a field will be planted to corn and pumpkins. About the middle of May, or as soon as the kernels of the first grain sown are in the "dough stage," the hogs will be turned into this field, which will be planned to have enough grain to furnish them all they can consume, in addition to the alfalfa, until August or September when the first of the corn will be ripe and the hogs will be turned in to "hog down" or harvest this for themselves.

The grain field will be harvested in sections, woven wire fencing being used to divide the parts of the fields. This fence is put up in a temporary way so that it can be moved, if desired, when another part of the field is to be harvested. Posts for intermediates may be driven in the ground, or set shallow, and the staples tacked in about half their length, so they can be pulled easily. Only the posts at the ends of the fields need be set solid, and these are a part of the permanent field.

This makes it possible to irrigate and plow such parts as are fed off before July 15 and plant them to corn, to be fed after the early corn is gone.

This late corn can be fed off in the field well into the winter, even as late as January or February. It will not be well to pasture land that is heavy clay or adobe when it is wet because that will "puddle" it and tend to ruin its physicial condition, make it cloddy instead of "mellow" when plowed, but there are many days every average winter when hogs can gather feed in the field.

This system of hog raising will furnish feed in the field from May until February, or nearly all of the time during that period. This makes a very short time to feed grain that has been harvested, only a couple of months or so—March, April and a part of May.

As a protection from winter rain and from sun in summer, cheap A-shaped hog houses will be placed in the field. These are built with two by six pieces for runners so that they may be moved anywhere. Hogs will keep sleeping quarters like these clean, and the only reason for moving them is when the hogs are moved to another field or when the bed becomes dusty and causes coughing. This dust may be laid by sprinkling with crude oil. This oil serves also as a lice and tick destroyer.

With sufficient quantity of a balanced ration, such as grain and alfalfa, the quantity to be determined by the hogs themselves, plenty of exercise, and a good bed, which dry ground makes in California, hogs will grow and make money every day in the year.

A Pig Creep

It is doubtful if there is any one detail in the care of young pigs that is more essential to rapid gains and early maturity than the pig creep.

This is a place, or a pen, or a part of a pen, in or adjacent to that in which the sows and pigs are kept and fed, into which the young pigs can creep but from which the sows or older hogs are excluded.

For a few pigs, one or two litters, a panel across the corner of a pen will suffice. It may have the bottom boards far enough apart so that the young pigs may crawl through or the panel may be raised a sufficient height from the ground. If it is raised it

Economy Calves

You can now feed a calf for the first five months of his life for less than half the cost of the milk he would consume in the old way. Do this with

Blatchford's Calf Meal

This meal has been known as the complete milk substitute since the year 1800. Very easily prepared. It prevents scouring promotes a strong rapid growth and makes a better cow.

Write for Actual Figures based on results, that show you how to increase your calf profits. The new data will be sent for the asking. Write today.

Montana wool growers have been selling wool freely at 25 cents.

must be nailed or wired very securely or the sows will break it down, for a sow's nose is a very formidable lever for breaking down fences or doors when she wants to get out or in.

If many more pigs are to have advantage of the creep it may be a whole yard of pen in which the little fellows may lie and sun themselves after they get their fill.

It is important to have ample trough room for all the pigs to be served, for in every litter and in every lot of young pigs there are some much stronger than the others—and the "survival of the fittest" is a stronger part of a pig's make-up than brotherly love or the Golden Rule. If there is plenty for all the little fellows will get all they need.

Flat, wide troughs that can be cleaned easily with a shovel and washed out with a disinfectant solution, like Kreso or some other good dip, are very satisfactory for feeding young pigs in creeps. These can be made with 2x12 plank for a bottom and 2x6 for the sides. This makes a trough about four inches deep. If these troughs are securely nailed or bolted together with a one-half-inch bolt 16 inches long, one at each end and one in the middle of a 10 or 12-foot trough, they are very durable, and when one feeding place becomes muddy or dirty are easily moved.

Little pigs will begin to eat soaked grain and middlings and drink milk at a few days of age. A good combination is middlings and a little oil meal and barley and corn soaked in skimmilk or buttermilk or water. You can fairly see youngsters grow when they get all of a mixture like this they can eat, have access to alfalfa pasture and get a big feed every few hours from sows that are fed a similar ration to make a big flow of milk.

"Why not put these troughs in the same pen with the sows and not bother with a creep?" some one will ask.. And the answer is that it would be all right to do this and far better than to have too little trough room for both sows and pigs, for in this case the pigs get but little, but when "pigs of a size flock together at feeding time" the best results are obtained. When old hogs and pigs are fed together, no matter how much room there may be at the troughs, the young ones are rooted around and away as the older ones range up and down looking for the best of the feed, and the little fellows do not "do" and grow as they do when a creep is provided.

Then when pigs are fed in a creep, all they can eat, from birth to six weeks or two months, or whenever weaning time is, they pass through this critical time of having their mother's milk taken away from them with little, if any, shrinking. In fact when pigs are well fed in this way their demands on the sow are not so great as when they do not receive this special treatment, and there is a tendency for the sow herself to wean the pigs at an earlier date than otherwise.

This is not written for those who always provide "creeps" for young pigs but for those who have never done so. Let any such hog grower try it on one lot of pigs; he will then be a convert forever.

A REMARKABLE FOOD PRODUCER

The Guernsey cow, Murne Cowan 19597, makes a world's record. The former world's champion, May Rilma 22761, also a Guernsey, is surpassed by a liberal margin in both milk and butter fat.

Murne Cowan was bred by A. F. Peairs of Elizabeth, Pennsylvania, and was purchased three years ago by O. C. Barber, Akron, Ohio, together with her three-year-old daughter, four-months'-old son and six other heifers. The nine head cost $1100. An estimate of their present value would be a very difficult problem.

Under Advanced Registry test as a six-year-old, beginning her year's work three months after freshening, she gave 16729.30 pounds milk and 845.41 pounds butter fat. Her second record, completed February 19, 1915, of 24,008.00 pounds of milk and 1098.18 pounds butter fat, places her at the head of all competitors, regardless of breed.

Murne Cowan's average milk yield shows that every three weeks for a year this cow has given her own weight of the most perfect food

SILOS

BUILT FOR YOUR PARTICULAR NEEDS.
EXACTLY AS YOU WANT THEM.

known, a superior quality of 4.5 per cent milk. The milk from the herd sells for ten cents per quart. Murne Cowan has thus produced three dollars' worth of milk daily throughout the year, with no Sundays or holidays for rest. She is a worker.

Guernseys have again demonstrated their ability as great producers among dairy cattle. Of even more importance to the practical man, they are most economical producers and profit makers. The total cost for food was 53.9 cents per day for the three dollars worth of milk.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Bitter Milk

I have a cow whose milk and cream turns bitter and a foam gathers as if it were soapy. She will become fresh in May. Is fed alfalfa hay and bran. She eats well and is apparently healthy. Runs loose in a corral. What is the trouble?—Subscriber, Pomona.

Bitter milk may be caused by a microscopic fungus in the system that has been started from musty feed or stagnant water.

It can usually be remedied by a physic followed by an internal antiseptic. Get powdered aloes, two uunces; powdered nux vomica, one ounce; turpentine, three ounces; enough raw linseed oil to make one quart. Mix and shake well and divide into four doses. Give one dose every other day. Follow this by giving a tablespoon of bisulphide of soda once a day.

Kicking Cow

I have a heifer fresh now three weeks. She kicks so we can not milk her. Can you advise some way to milk her so she will not kick?—Subscriber, Dinuba.

Kicking cows can usually be broken by gentle handling but sometimes it is necessary to use more strenuous means. A strap about the hind legs just above the hocks, crossed between the legs and buckled pretty tight, will prevent kicking. Also a strap around the body just in front of the udder drawn tightly will cause partial paralysis and prevent the cow from using the limbs freely. The use of the strap in either way a few times will usually stop the trouble.

Thin in Flesh

My heifer three weeks fresh was on pasture and is quite thin in flesh. Am feeding alfalfa hay, once a day pumpkins and once a day bran and a commercial stock food. What shall I give her to improve the flesh?—Subscriber, Dinuba.

Good and liberal feeding will increase the flesh and to expedite matters add the following tonic to the feed: Powdered gentian, four ounces; powdered nux vomica, three ounces; bicarbonate of soda, six ounces; enough farina to make two pounds. Mix and give a large tablespoon in the feed twice a day.

Cracked Teat

My heifer fresh two days has a cracked teat. The crack is between the opening and the udder. When milking milk exudes from the crack. Kindly advise me what to do.—Subscriber, Glenn.

The teat must have been injured to cause a crack through which milk exudes when milking. A milk tube should be used until the teat heals. Also put on an ointment made of gum camphor, two drams; rosin, half an ounce; turpentine, one ounce; olive oil, one ounce; vaseline, three ounces. Mix these while hot and when cool use after each milking.

Garget

After milking several months cow

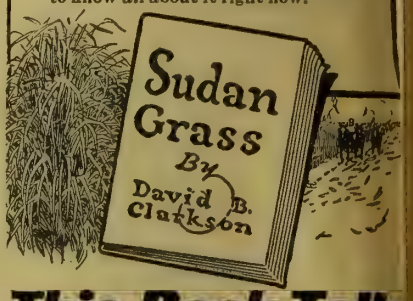
SUDAN GRASS

has proved to be the most profitable forage crop ever grown in America. Farmers who have planted it are making $20 to $100 an acre on hay, and from $300 to $700 an acre on seed. It yields the biggest tonnage to the acre of any high-class hay known. If you plant Sudan Grass, you never have to buy feed for your stock. As a catch crop, it turns loss into profit by replacing crops that have failed because of drouth or flood. By rotating it with other crops, you conserve and increase the fertility of your soil. Sudan Grass is one of the big factors that are bringing prosperity to the South. You ought to know all about it right now.



This Book Tells All About It

I am the largest grower of Sudan Grass in America. I have studied it for years. This book contains everything I have learned about Sudan Grass. It is complete and absolutely reliable. It is the first and only book ever published that tells all that is known about Sudan Grass. Profusely illustrated with actual photographs of growing, harvesting and threshing Sudan Grass.

Prof. B. Youngblood, Director of Experiment Stations for the state of Texas, says—
"Mr. David B. Clarkson: "I have read your new Sudan Grass book. Glad to note that it brings forth the most comprehensive and authoritative information on Sudan Grass as yet published in book form."

Don't Start Wrong! —Don't commence growing Sudan Grass until you know how to secure, grow and keep seed pure, how and when to plant, where and on what kind of soil it will grow, how to cultivate and harvest for hay and seed, how to thresh and all other particulars. My book tells you everything.

A Wonderful Book for 10c

This book may prove to be worth thousands of dollars to you. I want every American Farmer to know all I know about Sudan Grass. Merely send your name and address with 10c, to show that you are seriously interested, and will send you this book postpaid. Send 5 two-cent stamps or a 10-cent piece. Address P. O. Box 231

Unequalled in Power Efficiency & Fuel Economy

The WESTERN GAS ENGINE

The World's leading Gas Engineers and Scientists without exception agree that "Western" engines are **correctly** designed. They tell you that when investigating engines for the purpose of selecting one for your own use, **never** to select one with **horizontal** valves, for vertical valves are **far superior.** They furthermore say that fuel economy is impossible in a large bore engine, that a small bore has much less working strain, therefore more reliable and durable. For these reasons, the economy and efficiency of the "Western" commends itself to all forms of heavy irrigation and light ranch work

Western Built for Western Users

Judged as the Standard

The "Western" is regarded as the leader of high class engines—the engine that's **built right** by the largest and strongest Corporation in the Southwest. The Corporation has the most modern and completely equipped plant for the manufacturing of Gas Engines. No expense has been spared to make the Western Gas Engine more efficient and satisfactory than any other engine on the market.

Minimum Cost of Upkeep

Developes greater power at a lower cost. One-third of a cent per H. P. is all it costs to operate a "Western" when Special Gas Oil at 2¾c per gallon is used. All "Westerns" run efficiently and burn cleanly on low grade fuel, even to 38 gravity tops or toppings. Let our Advising Engineers explain which type is best suited for your needs.

Don't Experiment — Install A Western

The largest manufacturer in the world and many of the most careful and discriminating investors today are buying "Western" engines for their own use. Some users have now as many as six or more Westerns and will use no other make. Why?—**Because it's best—by every test.** Our free Catalog gives complete and valuable information. Write for our new price today.

Poultry for Profit

ANTI-CHINESE EGG LEGISLATION

Written for California Cultivator
By Geo. H. Croley

FOR the purpose of urging the passage of the Chinese egg bills introduced in the legislature by Knox Bonde, assemblyman from Sonoma County, a large number of poultry raisers from various parts of the state appeared at the joint session of the committee on manufactures and the committee on agriculture, held in the assembly chamber at Sacramento March 10. The showing made by these delegates seemed to favorably impress the members of the committees, and the indications point to a recommendation that the bill be passed.

Immediately following the adjournment of the committee meeting the poultrymen assembled to discuss the matter of a state wide organization to unify the influence of the poultry producers in all parts of California. Although it was considered only an informal talk the gathering appointed as chairman George H. Croley, president of the Federated Poultry Association of California, and as secretary C. A. Wilkins, secretary of the California State Poultry Association.

After considering many suggestions and plans the following resolution was unanimously adopted:

Whereas, on this day, March 10, 1915, a large number of poultry farmers from various parts of California assembled in Sacramento for the purpose of appearing before certain committees of the senate and assembly to request that these committees give their support to several bills affecting the poultry industry now under consideration by the legislature, and, this informal meeting of representative poultry farmers was called, at the adjournment of the committee meetings of the legislature, to discuss the general welfare of the poultry farmers of California; and it is shown that in this state over $90,000,000 is invested in this industry and that the annual sale of poultry products amounts to approximately $18,000,000, and owing to the apparent necessity of establishing a means to secure more united action on the part of those engaged in poultry culture in this state, and thus place the industry on a more substantial and dignified basis, be it,

Resolved, that it is the sense of this meeting that steps should be taken at once to call and hold a convention to be held in San Francisco for the purpose of bringing about a closer relationship between those interested in poultry culture in all parts of California, and be it further,

Resolved, that the chairman be, and is hereby authorized to appoint a committtee of 15 active poultry raisers in various parts of the state to formulate plans and provide ways and means to hold said convention.

All who are interested in the proposed convention are requested to send any suggestions or information that might be of value to George H. Croley, Room 316, 525 Market Street, San Francisco.

The agricultural bill has been amended in both the senate and assembly to include a division of poultry, and if the bill is passed the poultrymen of California will have a department of the state government to look after their interests, but it is possible the bill may not pass. In that case the poultrymen would have no department, but the other commissions already established would receive the state aid they have enjoyed in the past and continue as usual.

As a means of preparing for such an emergency Mr. Bonde has been requested to prepare a bill providing for a state commissioner of poultry. Even though only a small appropriation could be secured at first it was pointed out that much good could be derived from the efforts of a commissioner.

It is only necessary to point to the results obtained by the state dairy bureau to demonstrate the value of a central officer who has authority to direct and enforce proper regulation of an agricultural industry that is scattered about the state in small units.

Any of our readers interested in poultry, who favor the creation of a state poultry commission, are requested to make known their wish to his or her representative or to Mr. Knox Bonde, assembly, state capitol, Sacramento.

In a case of this sort the way to get what you want is to ask for it. The legislature now in session at Sacramento is honestly striving to represent the people of California, therefore it is the duty of the people to afford them an opportunity to carry out their wishes.

DUCK KEEPING FOR PROFIT

Comparatively few ducks are kept on the ordinary farm, as it is commonly supposed they eat more than they are worth. This idea is wrong, as it does not take any more grain to produce a pound of duck than it takes to make a pound of chicken. If ducks are taken care of properly and marketed at the proper time they are more profitable than chickens. A duck should weigh from four to six pounds at 10 to 12 weeks of age; whereas a chicken does not weigh that until four months old, and usually ducks are a few cents higher in price. We do not encourage duck raising on an extensive scale, but 25 to 100 can easily be raised and marketed on almost any farm at a profit. Many ducks are most prolific, laying an egg day after day for weeks together insuring a plentiful supply of eggs for hatching purposes and for table purposes if desired.

Swimming Water Not Essential

Ducks can be kept in healthy condition without a pond to swim in, provided they have plenty of good water for an occasional dip. They must have access to water deep enough to dip the whole head. If they do not they will have eye and nose diseases. They will lay freely in a small run, and ducklings can be reared in very limited quarters. Young ducks are more to be relied upon for eggs than old birds, especially in the winter, so it is advisable to make a start with March or April hatched ducks of the current year. The ducks should then commence to lay about November or December and continue throughout the winter.

The supply of eggs in the autumn and winter is greatly influenced by the mode of feeding. The ducks must be well fed, but not overdone with food or they will be too fat to lay. In the morning they should have a warm feed of barley or corn meal and middlings, equal parts, mixed with water, into a stiff paste. This can be varied with ground oats. If there is no grass run, plenty of green food, such as cabbage, must be allowed. A little chopped-up meat about three times a week helps greatly to stimulate egg production.

The ducks should have a good supply of sharp sand or grit. In the evening, before they are shut up, they should be given a good feed of oats thrown into a pan of shallow water. No food must be left lying about after meals, and all feeding utensils must be kept clean. A small house is necessary. If four feet long, three feet wide and three feet high it will be large enough for four or five stock ducks. During the winter three ducks will be sufficient for one drake. The

Tells why chicks die

E. J. Reefer, the poultry expert of 805 Main St., Kansas City, Mo., is giving away free a valuable book entitled "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

Conkey's POULTRY TONIC

Makes Chicks Healthy and Strong

Vim and vigor are necessary if the chicks are to thrive and mature quickly.

CONKEY'S gets them started right and keeps them growing. Package or pail, 25c, 50c, $1, $1.60 and $3.

CONKEY'S WHITE DIARRHEA REMEDY should be given in the drinking water from the start. It will help to bring your chicks through finely—25c and 50c. Send 4c for Conkey's Poultry Book—worth dollars to you.

floor of the house must be littered with dry straw, often changed.—Farm, Stock and Home.

HENS AND FRUITS

I believe there is no better kind of a farm in the world than the one devoted to the production of purebred poultry and first quality fruits. I know from practical experience that poultry and small fruits work together to a nicety. Almost any fruit grower, I am quite sure, can make purebred poultry breeding pay well in connection with his fruitgrowing operations, provided he will give the matter careful study. The great majority of farmers keep mongrel poultry, and why this is so I am unable to understand. I am very well convinced that it is not because of lack of means to buy a pen or two of purebreds with which to start. When one feeds 10 bushels of grain to a flock of 50 mongrels that will dress an average of two to four or five pounds each, and to a neighbor feeds the same amount to a flock of purebred birds that will dress from six to eight or nine pounds, it can readily be seen without figuring it out who will make the most profit. Then between the purebreds and the mongrels there is the great difference in price of eggs and birds sold for hatching and breeding purposes. Let me say, however, that no one should take up the work of raising purebred poultry and expect great returns right at the beginning, for if he does he is mighty sure to be sadly disappointed. Like every other business under the sun, it is best to gradually grow into it, rather than jump into it, as one then stands a much better chance of success.—Rural New Yorker.

DAMP POULTRY HOUSES

Dampness in poultry houses is a common cause of trouble in the farm flock, says a writer in Farm, Stock and Home. It may be produced by a variety of conditions. Leaky roofs, poor floors, low floors, poor location, and other similar conditions may be wrong. Dampness invariably leads to disaster, for it brings on colds and roup or rheumatism.

Every poultry house should be tight, and it must be made tight before its use will be entirely satisfactory. Every fair, sunshiny day the doors and windows of the house should be thrown wide open and the interior given a thorough sunning and airing.

A tight roof and walls and a well-drained location are the most essential things for dryness in the house. With the many excellent brands of prepared roofing that are now on the market and which sell at reasonable prices, there is really no excuse for anyone having a leaky roof on his poultry house.

Floors that are lower inside than the earth on the outside of the house are liable to become damp and soggy. Houses that are built on damp ground seldom have a chance to dry out. A good board or cement floor is the best solution in such cases, but the trouble can usually be avoided by filling inside the house with sand or gravel until the floor is a foot or more higher than the outside ground level. Keep the floors dry by all means.

A VALUABLE BY-PRODUCT

We venture to say that few, if any, of our farmers attach any importance whatever to the manure from poultry, and in the majority of cases, it is a waste product. It should be borne in mind that poultry manure is very rich in nitrogen, due to the fact that all the excretion of the kidneys, given in the form of uric acid, is voided in a solid form with the droppings. One of the United States experiment stations reports that the roost droppings from 25 hens for six winter months amounted to 375 pounds, and on this basis each hen produced 30 pounds annually, and 100 hens should be credited with an amount equivalent to 250 pounds of sulphate of ammonia, 300 pounds of phosphoric acid, and 200 pounds of kainit, if the manure were all saved and properly cared for.

Under prevailing systems of poultry management much of the value of the droppings is lost. The nitrogen is easily converted into gas. Anyone familiar with a badly-kept and filthy hen house will also be very familiar with this gas. Nitrogen in this form

The cheer-up wind of jimmy pipe joy

Copyright 1915 R. J. Reynolds Tobacco Co.

It sure comes to real men mighty quick when they get on the trail of Prince Albert—pipe and cigarette makin's tobacco that *never did* and *never will* bite tongues or parch throats.

That's because it's friendly-like; because it's manufactured by an exclusive patented process that cuts out the bite and the scorch and just makes men so all-fired happy they can hear the pollywogs purr even before the pussy willows peep into the spring sunshine.

PRINCE ALBERT
the national joy smoke

is particularly for men who smoke and for men who want to smoke and have found heretofore they couldn't. So take this invitation and come on around and get acquainted with Prince Albert in the tidy red tin. Let real pipe and cigarette happiness break right into your life.

Get started on the tidy red tin, then you'll graduate to the crystal-glass pound humidor with the sponge in the top that keeps your P. A. fine and pipe-fit all the time.

Prince Albert is sold everywhere. Toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors; crystal-glass pound humidors.

R. J. REYNOLDS TOBACCO CO., Winston-Salem, N. C.

POMONA
DEEP WELL PUMPS

For deep lifts, as well as shallow lifts, combined with high heads above surface and through long pipe lines. No auxiliary pump needed for forcing water above the surface.

Built and sold in California over 12 years. Hundreds of buyers will tell you they are always reliable and economical.

No pit required. Does not get oil into the water. Consumes less power per unit volume of water pumped.

Write for Catalog 103 with valuable information on irrigation.

Pomona Mfg. Co., Pomona, Cal.

Our "made right" irrigation valves are good, and not costly

Alfalfa Seed

Every field where Seed we offer for sale was grown in 1914 was thoroughly inspected by us for dodder, noxious weeds, etc., before it was harvested.

Everything we offer has been government tested to make our assurance doubly sure, both as to germination and foul weeds.

We are actually offering California's best product.

If you are looking for cheap, unreliable stuff, you will have to look elsewhere, but if you want good seed at an honest price we can serve you.

Samples, prices, etc., on application.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

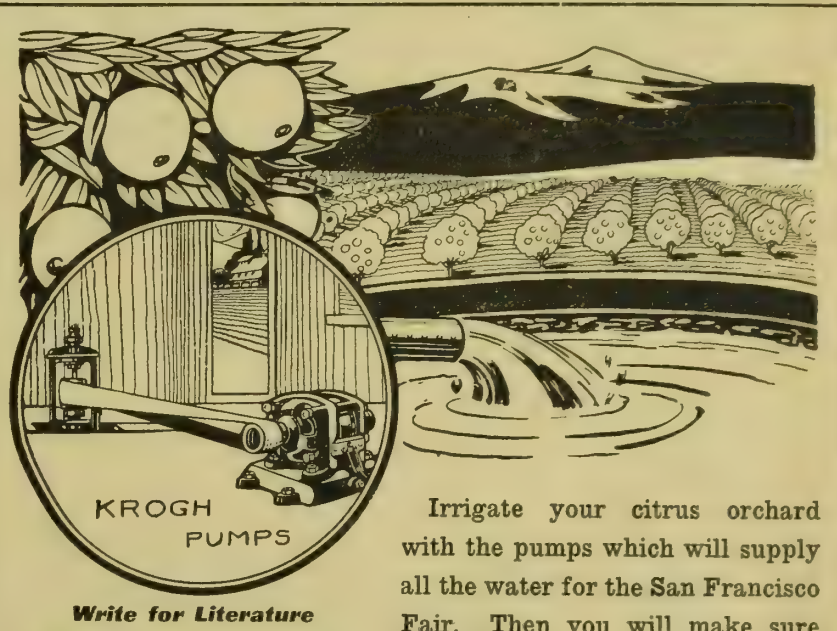
A VALUABLE BY-PRODUCT

Continued from Page 341

goes off in the air very raidly, in other words the manure has parted with its most valuable constituent. Again, if used alone on the soil, hen manure gives off its nitrogen too quickly; it does not contain enough phosphoric acid and potash. To get the best results from it, then, the poultry houses should be cleaned out regularly and the manure mixed with that of cattle or hogs, or it should be applied to the land at once, either as a top dressing or worked in. In any case effort should be made to follow out the best and most convenient system of saving this manure with as much care as is taken with other kinds. It is too valuable to lose.—Farm Stock and Home.

DAD WARD SAYS—

Anybody will help pull the engine to a fire—but only patriots will help put it back.



Write for Literature

Krogh Mfg. Co.

San Francisco Los Angeles

Irrigate your citrus orchard with the pumps which will supply all the water for the San Francisco Fair. Then you will make sure that your crop will be well taken care of at all times.

SEED TIME

"Cheap" seeds are dear at any price. But why pay high price for the best? We are not in the L. A. Seed Combine, but we have been selling seeds right here for years, giving the best of satisfaction because we sell the VERY BEST. We pay as much for our seeds as they do for theirs, which our invoices will prove. Our slogan: SEEDS at LOW PRICE and NO PRICE can buy better. Send for our Price List.

For a High Score Or a Full Bag

AT the traps or in the field, uniformity in the powder used is absolutely essential for consistent shooting. The experienced shooter or hunter knows this to be so, and uniformity is one of the qualities he demands of the powder he uses.

It is a significant fact that many of the most expert handlers of shotguns in this country shoot

Infallible
Smokeless Shotgun Powder

They know that this powder is always uniform; that it is carefully tested at the mill for high velocity, light recoil and even patterns; that it is water-proof, age-proof and weather-proof.

The next time you get shells see to it that they are loaded with Infallible. No matter when you get it, where you get it or how long you keep it, Infallible Smokeless Shotgun Powder is alway the same. Your dealer has shells loaded with it.

Two interesting books are yours for the asking: "Trapshooting" treats of this delightful sport from the viewpoint of both the veteran and the beginner. "Hercules Sporting Powders" is of interest to everyone who owns a rifle, shotgun or revolver. These books are free. Write for them today.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Anonymous

We are receiving so many unsigned letters and the department is becoming so filled that there must be some reduction, therefore we are again compelled to announce that anonymous communications will not be given attention. As soon as a letter is opened the signature is looked for, and if not found—no matter how helpful a question it may be—the waste basket will get it. This is an invariable rule and yet there is scarcely a day that unsigned letters are not received at the office. In some cases these letters have the full address of the writer on the envelope, and it is possible the envelope has been thrown away before this fact is observed, so it is best always, in addition to putting the name on the envelope, to attach it to the letter. We scarcely ever use the name, and certainly will not when it is indicated that name should be withheld.

Again, subscribers will send remittances in a letter and on the same sheet ask a question intended for the editorial department. It will expedite matters if the question or matter intended for the editorial department is written on a separate sheet with full name and address on it. It will then receive immediate attention.

Soil Analysis

Where may I obtain accurate soil analysis? Is such work done by the state university and what is the charge? How should one send samples of soil? — Subscriber, Yorba Linda.

The cost of analysis varies. We believe a complete analysis costs some $15 or more. However, there is a much simpler analysis or rather determination made which may be all that is required; that is, the soil chemists who advertise in the Cultivator will determine as to black alkali content of soil for two dollars, white alkali, three dollars; as to lime content, two dollars; potash, three dollars; nitrogen, two dollars, etc. The state university at one time made free analysis but it was found necessary to discontinue this work. We believe there is some advice given regarding general conditions but this is of a general nature rather than specific information in regard to a particular piece of land. As to method of taking the soil sample it would depend perhaps somewhat upon the crop to be grown, but for orchard work, for instance, usually to a depth of about four feet, being careful to secure proper proportions in each one of the four feet. The best method of securing sample is to make arrangements with the soil chemist and follow his instructions.

Strains of Poultry

What is the difference in the varieties or strains of the S. C. White Leghorns? Why is one any better than the other and how do they originate? Which is the best strain?—Subscriber, Earlimart.

There is no "best breed." Likewise, as to strains, it depends upon the ideal of the poultryman. One breeder will run entirely to form and feather, another pays no attention whatever to these points and will only breed from birds which are known to be prolific layers. This strain he may describe by calling it a 200-egg strain or Smith's or Brown's "High Producing Strain." The man who raises broilers again chooses an entirely different type of bird. These may possibly be all of the same breed but years of selection have made an entirely different class of stock. The poultry producer should choose his stock according to his own ideal and for the purpose for which it is to be used. If he wishes to win blue ribbons at fairs and poultry shows he must give attention to form and feather. He may, in addition, work for a producing strain. Of course, the more general the purpose the more diffcult the problem to meet all the requirements. Therein is the stimulus of the poultry industry. The problem is a big one and worthy of much study of both books and birds.

Oleander Wood

I recently cut an oleander tree of some size. I notice the wood does not check and is apparently hard and firm. Has it any commercial value?—W. L. T., Etiwanda.

We will pass this on to our subscribers. We have never heard of this wood having any use, probably for the principal reason that it is not produced in large enough quantity to be of value. However, it is worth investigating. Have our subscribers ever used it?

Sticktight Fleas

My chickens have sticktight fleas on head and comb, also close to the eyes. How can they be destroyed? What will kill them in the sleeping quarters? —Subscriber, Imperial.

From the Cultivator's poultry book, "Poultry for Profit," we quote: "For sticktight fleas and sand fleas spray or wash the houses with hot salt water and apply corrosive sublimate to the fleas found on the chickens. In handling corrosive sublimate care must be taken to keep it out of the chickens' or the attendant's eyes, for it is a very deadly poison."

Sapota Chica

Can you give me any information regarding the sapota chica? Is it cultivated and otherwise handled the same as an orange tree?—Subscriber, Pasadena.

The plant referred to is doubtless Achras sapota, the sapote chico or chicozapote of Mexico, known in the West Indies and Florida as sapodilla. This tree yields the chicle gum of commerce, which is the basis, or ought to be, of chewing gum; in addition it yields a fruit the size of a small apple, russet on the exterior, with a thin skin, soft, light brown flesh, and several hard, black seeds the size of a flattened bean. The flavor is very sweet, and it is much relished in tropical countries. The tree is common in the wild state in southern Mexico and is frequently grown in Cuba, other West Indian Islands, and throughout the southernmost part of Florida. It has been planted in California at various times, but so far as known has not yet come into fruiting in this state. There was formerly a tree five or six feet high on Dr. Franceschi's place at Santa Barbara, and Mr. Hart of Sierra Madre had a fine young tree on his place when it was cut down to the ground by the cold

Saving Time and Money on the Farm

HOW much do you personally know about the use of dynamite on the farm? Have you ever used it? If you have, have you used it to the fullest advantage? Have you made it do all the work of which it is capable?

With Hercules Dynamite you can plant trees, drain land, dig ditches, remove rocks, subsoil land, excavate cellars, cisterns, etc., and do many other things that space does not allow us to list, In the great majority of cases you can do all of these things more quickly, more thoroughly, and with less expense by the proper use of dynamite than by any other method.

HERCULES DYNAMITE

is not a Jack-of-all-trades. It will not always take the place of tools you are now using. Sometimes it can only be employed as a supplement to them. But most of the work usually done with a spade or an axe, a pick or a bar, can be done to better advantage with dynamite.

The place that dynamite is taking on the farm is growing bigger and more important every day. The man who is engaged in agricultural work and who has not thoroughly familiarized himself with this comparatively new factor in such work is not doing himself justice.

For your own benefit write for a book we have just published, called "Progressive Cultivation." It gives much information that many men now have at their finger tips and find almost invaluable in their daily work. It will help you in yours.

HERCULES POWDER CO

San Francisco, Cal.

SECOND HAND **PIPE**
AND CASING

All our pipe and casing has newly cut threads with new couplings attached and dipped in asphaltum. Guaranteed good as new. Prompt delivery on carloads or less. Small orders receive same attention as large ones. All sizes of pipe, also fittings and valves.

WEISSBAUM PIPE WORKS
169 Eleventh Street, San Francisco

weather of January, 1913. It makes very slow growth in California and is very susceptible to frost when young, so that it cannot be recommended as adapted to any but the most frostless and protected locations. Its glossy green foliage makes it a particularly handsome decorative plant and one which would be a welcome addition to our ornamentals.—E. O. Popenoe.

Black Scale

What solution may be applied to orange and lemon trees to kill black scale?—Subscriber, Watsonville.

It is now rather late to spray to secure best results. It will perhaps be better to wait until the fruit is of such size that it will not be injured, then either spray or fumigate. Fumigation accomplishes rather better results and is somewhat more expensive. The spraying may be done with kerosene emulsion or with commercial sprays, many of which are advertised. If the kerosene emulsion is desired, formula for its making is to be found in the special spray number of the Cultivator of September 11, 1914.

Gum Disease

How can I treat apricot trees affected with gum disease?—Subscriber, Hemet.

This exuding of gum on apricot trees is due to a physical condition of the tree or of the soil, or it may be due to a communicable disease caused by fungus. In the latter case removal of the diseased tissue, leaving only clean, healthy wood which is painted over with Bordeaux paste, is helpful. Ordinarily, however, curing unhealthful soil conditions will prove beneficial.

Horses Eating Wood

Commenting on answer to a recent query regarding horses gnawing manger, F. V. G. of Caruthers writes: "Try salt for the wood-gnawing horses mentioned in a recent issue. It stoped ours."—F. V. G., Caruthers.

Spots on Orange Leaves

What is the trouble with the orange leaves which I send, which are yellowed and have reddish brown spots?—Subscriber, Ramona.

These leaves were from trees suffering from chlorosis or yellow leaf. In addition they had bright red spots on the under side. They were referred to Prof. H. S. Fawcett, and he answers: "The reddish brown spots on the citrus leaves are something we know very little about. These are found quite commonly on leaves that happen to become turned over so their undersides are toward the sun. They are thought to be due largely to the burning effect of the sun."

Root Knot

What is the best way to rid the soil of root knot disease? I did not think it possible my soil could be infected but find trees are suffering with it. Is it possible it may have been introduced from the nursery? The trees are almonds and apricots. Have been out two years. Have dug more than one-half of them up.—Subscriber, Coachella.

It is possible this trouble was introduced with the trees. It is a most prevalent trouble. Thorough examination of trees when setting and rejection of those which are infected is about the only remedy. There is no chemical treatment within economic bounds which can be given the soil, and rotation, that is the growing for a time of crops which afford no opportunity for the fungus to reproduce itself, is practically the only means of ridding the soil of this trouble.

Thrush or Canker

An inquiry appeared in one of the February issues of the Cultivator as

"Whiting Mead, Los Angeles
Send me your New Catalog
-I wouldn't be without it!"

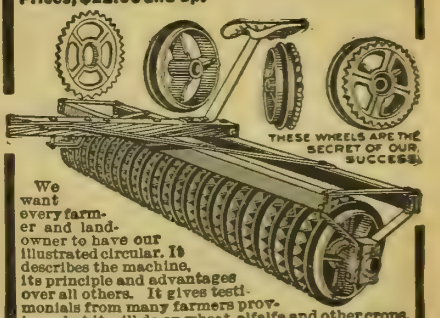
3 MACHINES IN 1
A perfect seed bed is as important as to sow or plant. The Western Pulverizer, Packer and Mulcher makes a perfect seed bed and leaves a loose mulch on top to retain the moisture in one operation. It will double profits on crops. Made in 8 sizes, 1 and 3 sections. Sold direct to you on one year's trial. Prices, $22.00 and up.



We want every farmer and landowner to have our illustrated circular. It describes the machine, its principle and advantages over all others. It gives testimonials from many farmers proving what it will do on wheat, alfalfa and other crops. It contains valuable information on how to prepare the soil for better results. Send for this circular today, whether you want to buy or not.

Does It Pay to Raise Apples ?

Go to the nearby store, get the prices of first-class apples—

"The Big Red Apple"

the kind grown in the Yucaipa Valley—and figure whether growing the king of fruits is a paying proposition. After doing so write the **Redlands & Yucaipa Land Co.** and get printed matter explaining fully the best apple, pear and peach land in California. Or come to Redlands and let us take you to Yucaipa and show what we have.

Yucaipa is 2400 to 3000 feet above the sea, eight miles from Redlands. Land is selling at $285 per acre, on easy terms, one share of water stock in a Mutual Water Company goes with each acre. This is the time of year to plant deciduous fruits.

to method of curing thrush in horses' feet. This is a difficult thing to handle and a good many remedies recommended have proven of no avail. Here is a sure cure that is economical. Clean the foot thoroughly and trim the frogs so the medicine will get to all diseased parts. Procure two ounces of butter of antimony and apply every day for a week. Do not allow it to get on the hair or it will blister. Keep the horse in a clean, dry place while treating.—W. I. Freeman, Orange.

Blackbirds a Pest

As a reader of your paper would like to ask regarding practical method of protecting maize from blackbirds. Noticed an item in your last issue regarding a bill introduced by a legislator for the purpose of discontinuing protection of blackbirds and robins. In this section the blackbirds are a serious manace to summer crops. Shooting has little permanent effect on them; scarecrows do little good. Some cheap method of using poisoned grain appears to be the only method. Have tried cyanide of potassium with barley but the birds would not touch it.—V. R. S., Calipatria.

Have any of our readers any suggestions to make as to control of this pest?

Olive Pomace for Fertilizer

Answering a request as to value of olive pomace for fertilizer, Prof. Charles B. Lipman of the University of California writes:

"The chief value of olive pomace for fertilizer is its value as a source of organic matter to the soil. It could only be of great practical value, therefore, if applied at the rate of at least five tons to the acre. The value from a plant food standpoint is very small. The value from the standpoint of availability of nitrogen I do not exactly know and should appreciate receiving a sample of the material from any one who is interested in order that we may make determination of the availability of its nitrogen. On a general basis, I am inclined to believe that aside from its value as above cited to supply organic matter in the soil, it is not to be considered important among our fertilizer resources."

VETERINARY QUERIES

Continued from Page 338

suddenly became lame and one quarter of the udder became hard and the milk stringy. Veterinarian advised poulticing. She recovered, but lately I found her in the same condition but worse. Have been feeding alfalfa and oat hay and picketing her in green oats. She is much better but has a hard lump in that quarter and the milk is a little curdy at first. What would you advise me to do with her?—Subscriber, Rialto.

Garget or inflammation of the udder is usually brought on by an abundance of rich feed. The blood becomes thick and clogs in the udder. Thin the blood by giving the following: Mix three pounds of epsom salts, two pounds of common salt and six ounces of powdered nux vomica. Give a handful of the mixture once a day. If the cow is ever bothered again with the acute symptoms give her a dram of tincture of aconite on the tongue every six hours until she is relieved. Rub the udder carefully for half an hour at each milking time and you will probably be able to rub out the lumps and improve the flow of milk.

In the great exposition in San Francisco, in a location that at once commands the attention of the visitor, is a building unusual in appearance and of striking character. It is the exhibit palace of the D. Ghirardelli Co., the great chocolate firm of San Francisco. This exhibit is a miniature reproduction of the great chocolate mills of this company.

Visitors are very seldom permitted to see the process used by chocolate or cocoa makers, hence this exhibit will be a revelation—for the first time in a public exposition will the people be given an opportunity of seeing the process of transposition of the raw cocoa bean as it comes in sacks from the tropical plantation, to the finished food packages in which it is sold to the public.

THE CALIFORNIA ORANGE SHOW

Written for California Cultivator for Orange Day, March 20, 1915
By Chris Haag

When you live in California, you are
feeling at your best,
With the rising sun to greet you,
from a night of gracious rest.
ou can leave the house bareheaded,
when you're going out to mow.
on't forget to do your duty.
Boost the Golden Orange Show.
Chorus
ing "Eureka, I have found it," Cali-
fornia first and last,
Where we shelter from the blizzard,
from the icy sleet and blast.
While the citrus fruits here ripen,
other states are full of snow;
Ve have sunshine of the brightest.
Boost the Golden Orange Show.

California is the grandest, with her
snow-capped mountain tops,
While the valleys for her people here
produce abundant crops.
In this golden sunset region there is
thrift where'er you go.
See the sights of California.
Boost the Golden Orange Show.

Why not live in California? From
her soil there's constant gain.
Juggle oranges and lemons, buy a
home and here remain.
Here are people from all nations,
picking flowers as they go,
In the wonder of her grandeur.
Boost our Golden Orange Show.

Celebrate Orange Day

Exhibitors at the Fifth National Orange Show at San Bernardino Give to Cultivator Readers Recipes of Prize Winners in the By-Products Division

ORANGE DAY is March 20 and the proper way to celebrate is to eat oranges. On this page the Cultivator has gathered together a number of attractive recipes for serving them. Many f these were received from exhibitors t the Fifth National Orange Show eld in San Bernardino, February 17 o 24, where citrus by-products were nade a special feature.

Manager F. M. Renfro of the National Orange Show writes:

"The National Orange Show did verything possible to encourage the se of citrus fruit by-products and to ducate the people along these line at he Fifth National Orange Show which as just closed. We were surprised urselves at the great number of good hings which can be made from citrus ruits. Next year we hope to make his department even more interesting nd attractive than it was at the 1915 how, but I can assure you it was one f the busiest spots in the big top and vas of great educational value."

Mrs. Reetta V. Hadden, chairman of he by-products committee, organized ier department in such a way as to nake it a center of attraction at the ig orange show, as she says "not only o the women who were charmed by lainty bits of culinary work, but to the nen who paused and looked. They saw ome things good to eat—that meant ollars and cents to them, the using of he culls.

"A group of prosperous looking range growers were standing near the ooth, where were displayed marmaades, jellies, preserves, pies, cakes nd conceits almost too numerous to mention, all made from the citrus fruits. One man, waving his hand above these cooked products, said, 'This department will revolutionize the orange industry of California; it means dollars and cents to us; it will use up our unmarketable fruit.'

"The men were as anxious to learn how the various things were made as the women, even more so, and wrote down many a recipe for their own trying out and to pass on to the housewife.

"The eagerness for knowledge along this line was manifested by the great majority of visitors. Everyone wanted to know how it was done and how it tasted, proclaiming their relationship to Adam and Eve of old."

Mrs. Hadden sends the following recipes:

Orange Paste—A Confection

Remove the yellow outer rind of three oranges. Cut in pieces, taking out the long inner core. Run these pieces through a coarse meat grinder, saving all the juice. Put ground mixture and juice and one cup of water in a granite vessel and cook until tender and quite dry. Stir all the time to prevent burning. When cooked tender and quite dry, to each cup of the cooked pulp add one cup of sugar and boil until it jellies, not too dry or it will candy. Pour out on marble slab or waxed paper, cool, cut in squares. Roll in sugar, chocolate, nuts; use in cake fillings or in sauces. Will keep indefinitely,—if locked up—otherwise it will disappear.

Orange Cake

1½ cups sugar, ½ cup butter, ½ cup milk, 2 teaspoons baking powder (rounding). Add to one-half of above 3 yolks. Add to one-half of above 3 whites, 2 teaspoons orange flavoring.—Reetta V. Hadden.

Orange Confectioner's Filling

2 egg whites (beaten dry), 2 2-3 cups powdered sugar, juice, grated rind and pulp of 1 orange.—Reetta V. Hadden.

* * * *

Orange Bread

Miss Florence L. Clark, in charge of the domestic science department of the Claremont high school, sends the following recipe for orange bread, which attracted much attention at the Orange Show:

One cake compressed yeast, one teaspoon salt, quarter cup lukewarm water, two tablespoons sugar, one cup orange juice, one egg yolk, grated rind of two oranges, four cups flour or less, two tablespoons butter.

Soften yeast in water, add butter melted, salt, sugar, egg yolk beaten light, orange juice and rind, then stir in flour for a dough. Knead until dough is smooth and elastic, then cover and set aside until double in bulk. Shape in a loaf.

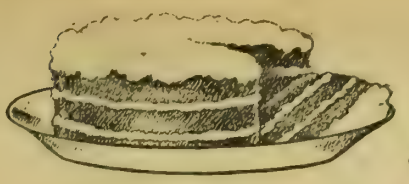
When nearly double in bulk bake one hour. Use with plain butter or any variety of cheese or sweet sandwiches, or to serve with cocoa or tea. The bread is good toasted and sprinkled with sugar, or spread orange bread prepared for sandwiches with orange marmalade worked with Neufchatel cheese.

* * * *

The domestic science department of the Covina High School, in charge of Miss E. L. Elliott, exhibited at the Orange Show eight glasses of jelly and 12 of marmalade. The display won a special award for jellies, and Miss Elliott has made public her recipes for grapefruit jelly and marmalades.

Jelly and Marmalade

For eight glasses of jelly and 12 glasses of marmalade.—Six grapefruit, three medium lemons. Remove and



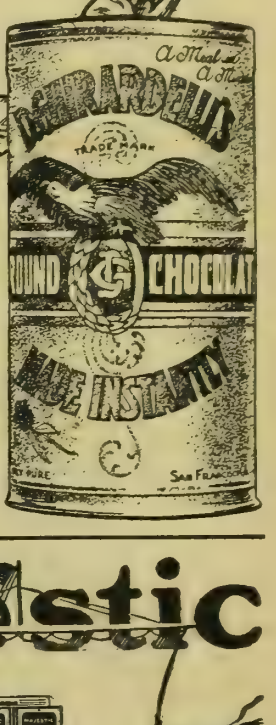
Ghirardelli's California Chocolate Cake

One cup of sugar; piece of butter, size of egg, creamed; two eggs; one-half cup of Ghirardelli's Ground Chocolate; one-half teaspoonful cinnamon; one-half cup of milk; one cup of flour; two teaspoonfuls baking powder; mix with flour, bake in layers, spread with either strawberry jam or white of egg beaten to froth with cup of sugar.

The making of dainty, tempting, delicious desserts is greatly simplified when

Ghirardelli's Ground Chocolate

is used. It is noted for its smoothness, and in the making of cakes like the above, it will give just the richness and flavor desired.



The daily use of Ghirardelli's Ground Chocolate as a beverage is to promote family health as well as to practice economy.

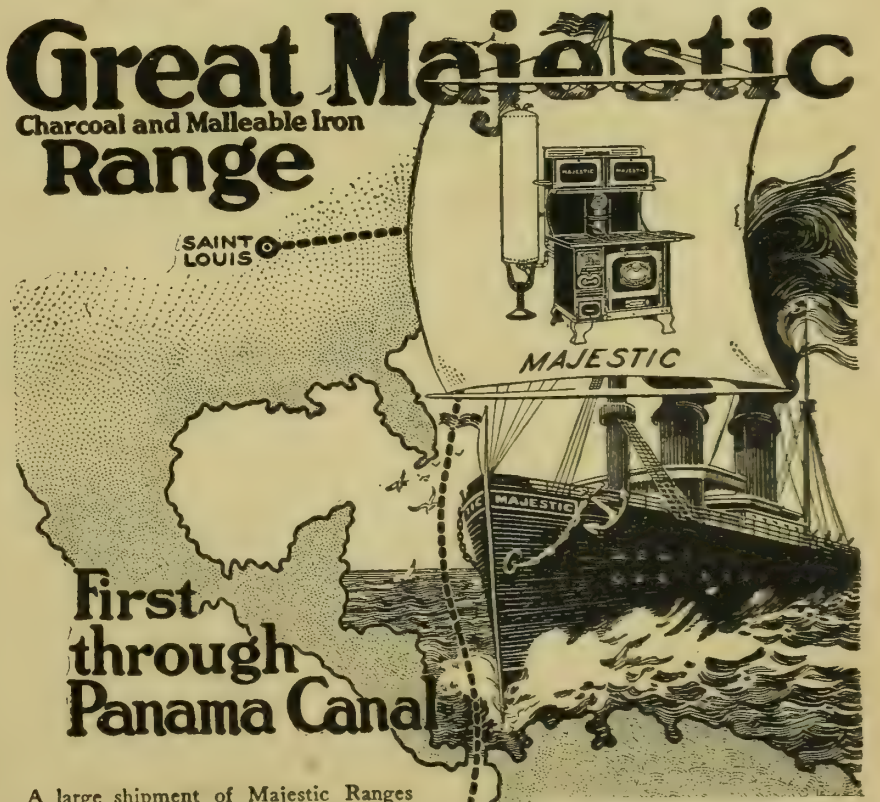
Sold only in hermetically sealed tins.

Order from your grocer to-day.

D. GHIRARDELLI CO.

San Francisco Since 1852 California

Great Majestic
Charcoal and Malleable Iron Range



First through Panama Canal

A large shipment of Majestic Ranges recently went to South America. They hold the honor of being the first to pass through the Panama Canal.

But that honor isn't half so interesting to you as the causes which led up to it:—

An exporter received orders from a firm in Chili to buy a quantity of ranges, the *best* made in America.

Many ranges were thoroughly investigated. The investigation proved that the Majestic gives the most economical and longest service, and the *best baking results* and it was **chosen to fill the order from Chili**

The Majestic does not compete in price with any range. Its sales depend solely on qualities which prove its economy in use. Its popularity in this country rests on the sound judgment of American housewives; who know the genuine economy of paying the Majestic price and getting a range that saves fuel and repairs and gives much better baking results — and much longer service than ordinary ranges. It's cheapest in the long run.

Send for "Range Comparison"

FRUIT GROWERS HEADQUARTERS

When in Los Angeles, stay at Hotel Clark. Ideal location. One-half block from Central Park. Close to all stores. Extremely reasonable rates. 555 rooms with bath. Excellent grill service—popular prices.

Hill Street Between 4th and 5th.

discard outer yellow rind. Remove all white. Tie in a close-meshed bag. Shred pulp very fine. Add three times its bulk of water. Boil hard 45 minutes with the bag of white, which furnishes the pectin, immersed in the liquid. Skim frequently. Remove bag, throw contents away.

Strain off six glasses of clear liquid and let both pulp (which should also have sufficient liquid on it) and clear juice stand 24 hours. Carefully syphon off the top of the clear liquid, put to boil, boil 10 minutes, add equal quantity of warmed sugar and boil till it "jellies" (about five minutes). When the liquid "sheets" from the spoon it is jellied.

Treat the pulp the same way for the marmalade. Orange jelly and marmalade can be made similarly. Those who do not object to the orange peel and white may leave it in.

This process makes the clear amber jelly. The part which settled in the clear juice will make good jelly, but it is opaque.

* * * *

Kumquat Jelly

Mrs. H. J. Evans, Monrovia, an exhibitor at the Orange Show, gives her recipes for kumquat jelly and tangerine preserves.

Slice fruit (do not peel). Cover with water and cook to a pulp. Strain through a flannel bag. Take equal quantities of juice and sugar and cook till it jellies.

Tangerine Preserves

Peel tangerines. Remove all skin and seeds from sections. Add just enough water to keep from sticking and cook 45 minutes. Then measure fruit and add an equal amount of sugar. Cook 30 minutes longer.

* * * *

Mrs. William Starke of San Bernardino sends a few recipes from her list in the Orange Show exhibit.

Lemon Pie

Make pastry and bake crust first. Fill when cold.

Filling—A few gratings and juice of one lemon, 1 cup sugar, 1 heaping tablespoon of corn starch, mix with sugar; 1 pint hot water, pinch of salt; 2 eggs, whites for frosting. Cook in double cooker until thick and fill crust. Beat your whites very stiff and add one tablespoon sugar, beating again very rapidly for a few moments. Cover pie and brown lightly under blaze.

Orange Pie Filling

A few gratings and juice of two oranges, juice of ½ lemon, 1 small cup sugar, 1 heaping tablespoon cornstarch, 1 teacup hot water, salt, 2 eggs, whites for frosting. Method same as lemon pie.

Snow

To be served with lemon or orange sauce. 1 envelope gelatine. 1 cup sugar. 1½ pints water, pinch salt, whites of three eggs, lemon flavoring. Method: Put gelatine to soak in ½ pint cold water. Boil sugar and pint water and add gelatine and let all boil for five minutes. When cool add the stiffly beaten whites of eggs and beat very fast until it is very white and light. You can put in molds or let set in same vessel and when ready to serve pour your cold sauce over the snow. I prefer to dip it out with a spoon, as it looks then as near like spoons of snow as possible.

Orange Sauce—1 cup sugar, juice of 1 orange and teaspoon gratings, juice of ½ lemon, 1 tablespoon cornstarch, 2 tablespoons butter, 1 pint hot water.

Orange Tarts

Roll pastry and cut in squares. Place 1 tablespoon orange paste in center of each square and fold corners to center and bake. When cold, spread a powdered sugar icing with lemon flavor on each tart.

Orange Paste

Wash your oranges thoroughly and grind in coarse meat grinder until you have one quart of pulp and juice. Place in a vessel over fire with one quart water and cook slowly for 60 minutes, watching closely. Add one quart sugar and cook until it becomes very thick, stirring often. This is nice for short-cake by moistening with a little hot water and spreading between layers. Then serve with whipped cream. Or for stuffing dates, covering with fondant makes delicious candy. Will keep for any length of time, and you do not have to seal it.

Orange Puffs

½ cup sugar, 1 egg, 1 cup orange juice, 1¾ cups flour, 1½ teaspoons baking powder, 1 tablespoon melted butter, pinch of salt.

Method—Put all in mixing pan together and beat it quickly. Then steam in cups ½ hour. Serve hot with orange or lemon sauce. Have your sauce hot also.

Lemon sauce—1 cup sugar, juice and gratings of 1 lemon, 1 tablespoon cornstarch, 2 tablespoons butter, 1 pint boiling water.

Orange Cake

1 cup sugar, ½ cup butter, ⅔ cup orange juice, 2 cups flour, 2 teaspoons baking powder, 3 eggs, well beaten, leaving whites of two for icing.

Method—Cream sugar and butter, then add the rest of the ingredients and bake in two layers.

Icing—1½ cups sugar, boiled with ½ cup hot water until it threads. Pour over the stiffly beaten whites of eggs and beat until cool. Just before spreading on layers add one tablespoon dry orange gratings or ½ cup candied orange peel, cut very fine.

Lemon Cake

Any white layer cake will do.

Lemon filling for cake—1 cup sugar, 1 egg, 1 lemon, 1 tablespoon flour, 1 tablespoon water.

Method—Place dish in vessel of boiling water and let it thicken. When cold spread between layers. Use an icing for top.

Orange Omelet

Beat the yolks of four eggs, add four teaspoons powdered sugar, four tablespoons orange juice, one-half teaspoon salt, and the grated rind of one-half orange. Beat the whites until stiff, and fold into the yolk mixture. Turn into a hot buttered omelet pan, cook very slowly until browned underneath, then put into the oven to finish cooking. Care should be used not to burn the omelet, because the sugar will tend to make it scorch easier.

Baked Oranges

Select oranges of uniform size, cut slices from top, remove white core and loosen pulp from skin with a sharp knife. Place in pan, fill part way up on oranges with warm water, and boil until skins begin to get tender. Pour off and renew water and continue cooking until skins are thoroughly tender. Remove to baking dish. If the liquid around is at all bitter, pour most of it off and add fresh water; put on top of each orange a generous amount of sugar and a lump of butter and bake until somewhat browned over the top. Remove to serving dish and thicken syrup with one tablespoon cornstarch mixed with a little cold water. Pour over oranges when serving. These may be served hot with the meat course or cold as a dessert. Shephard's Inn, Carpinteria.

Orange Puffs

⅓ cup butter, 1 cup sugar, 2 eggs, ½ cup milk, 1¾ cups flour, 3 teaspoons baking powder. Cream the butter, add sugar gradually, and egg well beaten, mix and sift flour, baking powder and salt; add alternately with milk to first mixture, bake in buttered individual mold tins.

Orange Sauce

1 cup sugar, 2½ tablespoons flour, grated rind 2 lemons, ¼ cup lemon juice, 1 egg, 1 teaspoon butter. Mix sugar and flour, add grated rind, lemon juice, and egg slightly beaten. Put butter in saucepan; when melted add mixture and stir constantly until boiling point is reached. Serve cold or slightly warm.

Orange Hard Sauce

(For puddings.) Extract the juice of one orange; add half its measure of butter and sugar; cream well, add sugar gradually until no more can be worked in. Flavor with grated orange rind or orange extract.

Orange and Celery Salad

Clean thoroughly one bunch of celery, cut in one inch pieces and fringe; drop into cold water to make crisp. Add two oranges separated into sections and cut into small pieces. Dress with French dressing.

Orange and Mint Salad

Peel two large oranges, separate into sections and cut each section into thirds. Sprinkle with two tablespoons pulverized sugar, two tablespoons finely chopped mint, one tablespoon grape juice and one-half tablespoon lemon juice. Chill thoroughly with salt and ice, then serve in sherbet glasses or orange baskets, garnished with a sprig of mint.

Frozen Orange Souffle

1½ cups orange juice, 1½ cups sugar, 2 tablespoons lemon juice, yolks 5 eggs, 1½ teaspoons granulated gelatine, 3 tablespoons boiling water, 2½ cups cream, candied orange peel, pistachio nuts.

Mix fruit juice, sugar and yolks of eggs. Cook over boiling water until mixture thickens; then add gelatine dissolved in boiling water. Cool, freeze to a mush, add whip from cream, and continue freezing. Mould, and serve garnished with candied orange peel and pistachio nuts.

Orange Delicious

2 cups sugar, 1 cup water, 2 cups orange juice, 1 cup cream, yolks 2 eggs, 1 cup heavy cream, ¼ cup shredded candied orange peel. Boil sugar and water eight minutes, then add orange juice. Scald cream, add yolks of eggs, and cook over hot water until mixture thickens. Cool, add to first mixture with heavy cream beaten stiff. Freeze, when nearly frozen add orange peel. Pack in salt and ice and let stand 1½ hours.

Orange Ice

4 cups water, 2 cups sugar, 2 cups orange juice, ¼ cup lemon juice, grated rind of two oranges. Make syrup by boiling water and sugar five minutes, add fruit juice and grated rind, cool, strain and freeze.

Candied Orange Peel

Remove peel from four thin-skinned oranges in quarters. Cover with cold water, bring to boiling point, and cook slowly until soft. Drain, remove white portion, using a spoon, and cut yellow portion in thin strips, using scissors. Boil one-half cup water and one cup sugar until syrup will thread when dropped from tip of spoon. Cook strips in syrup five minutes, drain, and coat with fine granulated sugar.

Orange Marmalade

Thoroughly wash and wipe four large oranges and two large lemons, peel with a knife, being careful to only use the outer yellow rind. Put the rinds of both through the food chopper. With a sharp knife scrape every bit of the bitter white rind off, then cut the lemons in the thinnest slices possible. Divide the oranges into sections after cleaning off all of the white rind. Cut the sections up into thin slices and add to the rind that has been put through the chopper. Take just as much cold water as fruit and rind, boil slowly one-half hour, then add just as much sugar as there is of fruit and water and boil rapidly about three-quarters of an hour or until it jellies. Makes about 12 glasses.

Amber Marmalade

One grapefruit, one orange, one lemon, seven pints cold water, five pounds sugar. Wash and wipe the fruit with a soft cloth, cut each in quarters, then cut each quarter through peel and pulp into exceedingly thin slices, discarding the seeds. Pour the water over the prepared fruit and let stand over night. Cook until the peel is very tender; it will take four or five hours. Again set aside over night. Add the sugar and cook, stirring occasionally, until the syrup thickens slightly on a cold dish. Store in glasses, cover with paraffine.

Perfect Orange Marmalade

Sour thin skinned California oranges that are on the market between Thanksgiving and Christmas are best for marmalade. Acid oranges insure a marmalade that will jelly. The following recipe, carefully followed, will result in a perfect "show-window" marmalade, in which golden particles of the fruit float in a clear amber jelly:

Twelve oranges, 5 lemons, 8 quarts cold water. Slice very thin and cover with eight quarts cold water. Let stand for 24 hours. Cook one hour after boiling point is reached, stirring almost constantly. Put away for another 24 hours. Measure one cupful of sugar to each cupful of orange mixture and cook another hour. Put into jelly glasses or pint jars. This receipt makes two dozen glasses.

HOUSEHOLD QUERIES

Neighborly Helps

In response to requests in last week's "Household Queries" column we have received the following recipes:

Orange Marmalade

I am sending you a recipe for orange marmalade which we like better than any I have ever seen. Made of seedless navel oranges it is absolutely without a trace of bitterness.

One orange and one lemon. Quarter the fruit and shred with a very sharp knife. To each measure of shredded fruit allow three measures of water. Place in a preserving kettle and set away in a cool place until the next day. Boil hard ten minutes. Again set away until the next day. Measure the mixture and to every cup of pulp allow the same amount of sugar, and at the last add one measure extra. Cook until the ordinary tests show that it will jelly. From one orange and one lemon seven glasses of marmalade will result.—Mrs. C. G. Warren, Riverside.

Orange Marmalade

Take 8 oranges, 4 lemons, 2 grapefruit. Remove all seeds and pass through meat grinder. Add 6 quarts water and let stand till next day. Boil for two hours, then add 12 pounds sugar. Boil all together another two hours until it jellies. This makes eight quarts of marmalade. Some people object to a bitter flavor and prefer more oranges and less grapefruit.—Mrs. J. F. Price, Rivera.

Amber Marmalade

Shave fine two oranges, one lemon, rejecting nothing but seeds and core. Add juice of one grapefruit. Measure and add three times the quantity of water. Let stand over night. Next morning boil 10 minutes. Let stand another night. Then add pint for pint of sugar and boil till it jellies. Stir as little as possible. Will make nine or 10 glasses.—K. C. M., Los Angeles.

To Cook Belgian Hares

Clean and cut up in pieces, let drain, then salt and pepper each piece and roll in flour. Lay in a roasting pan and pour in a half cup of water. Cover and put into a hot oven for a half hour, then lower the gas, cook slowly an hour longer. This for a young hare; an old one will need a half hour longer. This is also a good way to cook chicken.—K. C. M., Los Angeles.

No man ever sank under the burden of today. It is when tomorrow's burden is added that it seems more than one can bear. Live, then, today, and tomorrow will always be bearable. —MacDonald.

Remember that to live is to move, and the power that moves us into hell has the power to move us out, for life has no stopping places.—X. Y. Z., Ohio.

Life is not really what comes to us, but what we get out of it.—Jordan.

Style, refinement, service, comfort and wear are represented to the utmost degree in our fine shoes for ladies.

Mayer

HONORBILT SHOES

No matter how much more than our price you are willing to pay, better material and workmanship positively can not be secured. We buy the market's best of both—try them.

Citrus Fruit Market

LOS ANGELES, March 17, 1915.

There is a bit of hope that the near [f]uture will see improvement in the [o]range market. Just at present con[d]itions are "simply fierce." One car [i]n Denver only five days from pack[i]ng house showed 30 per cent decay. [M]uch of the fruit going farther East [i]s being iced, but still is decaying bad[l]y. This, with market conditions, has [t]aken the bottom entirely out of the [m]arket.

The lemon situation is little better [t]han the orange and no immediate [p]romise of improvement.

[S]hipments

Shipments of oranges to date since [N]ovember 1, 1914, 10,857 cars; lemons, [1]385; total, 12,242. To same date last [s]eason: Oranges, 11,616; lemons, 712; [t]otal, 12,328. From Tulare, Butte and [N]orthern California points: Oranges, [5]748 cars; lemons, 171; total, 5919. Last [y]ear same date: Oranges, 4942; lemons, [3]5; total, 4977.

NEW YORK, March 15.—Twenty-three [c]ars navels, 5 mixed cars and two cars [l]emons sold. Market about 10 to 20 cents [h]igher on navels; lemons 20 cents higher. Weather fair.

CLEVELAND, March 15.—Four cars sold. Market is steady.

PHILADELPHIA, March 15.—Nine cars sold. Market is steady.

ST. LOUIS, March 15.—Eleven cars sold. Market is easier.

BOSTON, March 15.—Twenty-six cars sold. Market is unchanged.

KANSAS CITY, March 15.—Two cars sold. Market steady. Cloudy.

PITTSBURGH, March 15.—Twelve cars sold. Market steady. Better demand for lemons.

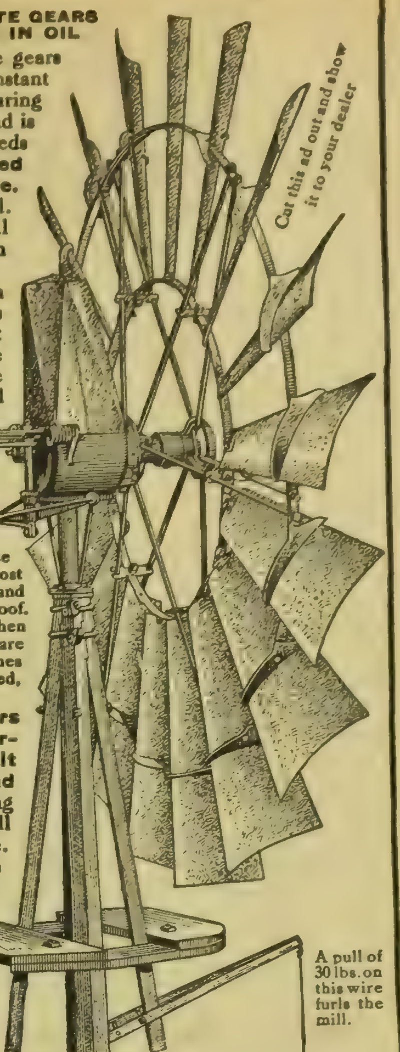
CHICAGO, March 15.—Stocks of Apples are steadily diminishing. California oranges are in plentiful supply, but Florida offerings are scant. Apples, boxes, western stock, Delicious, $2.25@2.75; Winesap, 1.25@1.40; barrels, Greenings, 2.25@2.75. Oranges, boxes, California navels, 1.90@2.25; Floridas, 1.75@2.25; Indian Rivers, 2.25@2.75. Lemons, boxes, Californias, 2.00@2.75. Grapefruit, heavy sales, boxes, 1.75@2.00. Kumquats, very scant offerings, 10@12½ per quart. Strawberries, limited arrivals, 27½@35 per quart.

THE AUTO-OILED AERMOTOR WITH DUPLICATE GEARS RUNNING IN OIL

Every bearing is constantly flooded with oil. The gear case, in which the duplicate gears run, holds two or three times as much oil as is required by the mill for a year of constant running, days, nights and Sundays. From the gear case the oil flows through every bearing in a continual stream. It goes out through the thrust washers in the hub of the wheel and is automatically returned to be used over and over again. No oil is wasted. This mill needs oiling but once a year. **Two quarts of oil in the gear case of the 8-foot Auto-oiled Aermotor will keep the gears and every bearing flooded with oil for a year or more.**

The galvanized helmet covers the gears, keeps out rain, keeps out dust, keeps in oil. The old Aermotor was known the world over as "the windmill which runs when all others stand still." This new Aermotor with gears and bearings flooded with oil runs in much less wind than the old Aermotor.

The two large gears, which lift the load straight up, are each independent of the other and each is driven by its own pinion on the main shaft and must take its half of the load at all times. The Auto-oiled Aermotor, with its duplicate gears and two pitmen lifting the load straight up, is unbreakable.



Every 8-foot mill is tested under a pumping load of 3000 pounds on the pump rod. For the larger sizes the load is proportionately greater. We know that every one of these windmills is unbreakable. We venture the assertion that this is the most nearly perfect, best made, best tested, best oiled, most nearly perpetual, automatic and self-sufficient of any machine of any kind ever made for farm work and the most nearly fool-proof. There is no friction on any part of the furling device when the mill is running and very little when he wheel is furled. A small child can easily furl this windmill or an automatic regulator can take care of it. One of these mills has been furled 10,000 times in one day by a man on our premises—more times than it would ordinarily be furled in 30 years of service. A band brake, of the automobile type, is used, and it always holds.

If you are tired of climbing a windmill tower; if you are tired of buying repairs and having them put on; or, if you are tired of waiting for a big wind, let us furnish you an unbreakable, self-oiling, ever-going mill to go on any old tower. It costs but little and you will get the difference between no water in a light wind and an abundance of water in almost no wind. The flooding of all the working parts with oil, the perfect balance of the wheel and vane on the tower, the very small turntable on which the mill pivots and the outside furling device make this difference.

Now there is no objection to a high tower. Have as high a tower as you need to get wind. You don't have to climb it. Your dealer can come once a year and put in oil, if needed, and inspect the mill.

Why not have flowing water, cool in summer and warm in winter, always fresh and pure? It will cost next to nothing. It will give health to your family and stock. Let the water run into a good size reservoir and raise all the fish of the choice kinds your family can eat, and have water to irrigate your garden and make it raise many times as much as it would otherwise. The Auto-oiled Aermotor makes all this possible as it can run from one year's end to another with practically no wear and no cost. Water costs nothing. Use it. To let it stand is to abuse it.

If interested, write **Aermotor Co.,** 1146 So. Campbell Avenue, Chicago. Write right now.

An Olive Branch

The Goodrich Tire, like the trained athlete, is all brawn and muscle—no fat

❖ ❖ ❖

THE old Olympic Game promotors were great for what we call "form."

Symmetry, proportion, soundness and proper balance out-bid bulging muscles for favor—yes, and out-won, too, just as they will today.

Mere bulk never was synonymous with endurance—and the truth of this statement drives home with a bang, when you apply it to tires.

❖ ❖ ❖

IF thick, heavy tires were the last word in tire construction, we could wipe out of existence a Goodrich Research and Test Department employing seventy people. We would take off the road a battalion of ten automobiles that run twenty-four hours a day and every day in the year, grinding tires of all makes to pieces, just for the sake of information to us and eventual economy to the user of Goodrich Tires.

There is where we learn to cut out of a tire the material which gets the user nothing.

Of course, when we stripped tire price lists of their padding—fictitious values—we *expected* rivals to say we had stripped our tires.

IT was their only "come-back." They *had* to say that, in stripping down prices to the point where they were *fair* to dealer and consumer and left no room for injurious price-cutting tactics, we had stripped our tires of some quality, too.

❖ ❖ ❖

THE Goodrich Tire, like the trained athlete, is all brawn and muscle—no fat. It represents an achievement—the ability to cut out the extra costs of manufacture, the extra costs of labor, of extra, needless material, and to give you the best, long-mileage, high-standard tire in the world.

There are padded tires as well as padded price lists.

Don't pay for padding.

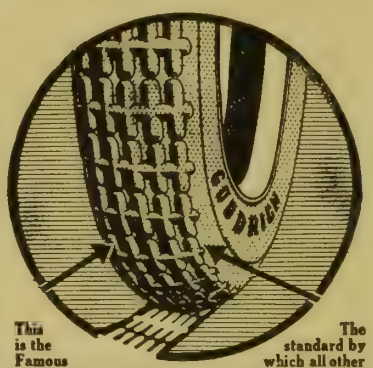
Now don't forget this—we are talking in the main about Goodrich Safety Tread Tires, for they represent ninety per cent of our factory output for resale.

Furthermore, while we have put the padded prices on smooth tread tires on the run, the evil of padded prices on non-skid tires still is in evidence, as shown in table below:

Note the following table of comparative prices on non-skid tires. Columns headed "A," "B," "C" and "D" represent four highly-advertised tires:

Size	Goodrich Safety Tread	OTHER MAKES "A"	"B"	"C"	"D"
30x3	$ 9.45	$10.55	$10.95	$16.35	$18.10
30x3½	12.20	13.35	14.20	21.70	23.60
32x3½	14.00	15.40	16.30	22.85	25.30
34x4	20.35	22.30	23.80	31.15	33.55
36x4½	28.70	32.15	33.60	41.85	41.40
37x5	33.90	39.80	41.80	49.85	52.05

If you are charged less for any other make than Goodrich, they are taking it out of the tire; if you are charged more, they are taking it out of you.



This is the Famous Goodrich Safety Tread

The standard by which all other non-skids are judged

The B. F. Goodrich Co., Akron, O.

GOODRICH Fair-Listed TIRES

CITRUS Trees

Ask any man who has ever planted "R. & W." trees and he will tell you that they always grow true to name and produce "bumper" crops of premium fruit.

For years we have specialized on the growing of high grade orange, lemon, pomelo and olive trees.

It is but reasonable to suppose that with our large facilities and thirty years' experience we are in a position to grow better trees than anyone else—and that we do so, we would like the opportunity of proving.

ANY QUANTITY — REASONABLE PRICES

We have a magnificent stock of all the best varieties and ask the privilege of quoting you our lowest rock-bottom prices. No matter how large or small your proposed planting—it will pay you to get in touch with us NOW.

WRITE US TODAY

We will gladly advise with you free of charge as to best sorts to plant for largest profits. Our close touch with market conditions places us in a position to give you valuable suggestions.

Vol. XLIV No. 12 LOS ANGELES: THURSDAY, MARCH 25, 1915 One Dollar Yearly

The Feeding Problem

To be Profitable the Dairy Must Produce, Largely at Least, Its Own Feeds. Some Crops Which May be Grown in California Described for Cultivator Readers

By Dr. Leroy Anderson

THE practice of growing summer feed by dairymen in San Timoteo Canyon in Riverside County is worthy of study and imitation by others similarly situated. This canyon is traversed by the Southern Pacific railway between Redlands and Beaumont. Most of the land lies above available water supply and must be utilized by non-irrigated crops. The favorite crop is early amber sorghum. The land is plowed in March as soon as fit after the heavy winter rains have ceased. The latter part of April or first of May it is again plowed, properly fitted and planted to early amber. Planting is done by a regular corn planter in drills about three feet apart. As soon as up a few inches high, cultivation begins and is continued until July or when high enough for feeding. The cows are allowed to harvest it themseves, thus saving the labor of cutting and hauling. As an illustration of the amount of feed obtained, a field of 90 acres afforded pasture for 130 cows during the month of July, 1913, the dry year. The cows fed on it during the day and had access to alfalfa hay in the corral at night. After being eaten down, the sorghum on moist soil gives a second crop, but on drier soil very little second growth is secured. This is a method of utilizing cheap land in growing succulent forage and it pays to prepare the soil well and cultivate the growing crop thoroughly to conserve the moisture.

Non-Saccharine Sorghums

Kafir corn, Egyptian, milo maize and the like are all more or less grown as dry land crops and in culture and use are familiar to most dairymen. Of the white, red and black-hulled kafirs the red seems to be the most popular for fodder because the leaves are large and numerous and the grain yields well. The seed matures in 12 to 14 weeks but the stalks usually remain green much longer, thus enhancing its fodder value. Modern practice has found it possible to silo these sorghums, which greatly increases their value to the dairymen who may have land where Indian corn will not thrive but which is not too dry for kafir or Egyptian.

A new sorghum has recently come to light, having been secured from Sudan. In habit it resembles milo except that the heads are uniformly erect. In drouth resistance it compares favorably with any sorghums yet introduced. It is known as feterita and is commented upon by Professor Stanley F. Morse of the Arizona experiment station as follows: "The principal advantage of feterita over kafir and milo maize is that it will mature in less time (about 20 days). Milo maize matures in about 100 days and kafir in 120 days. Feterita requires the least water, milo maize and kafir the most. In feeding value the grain of feterita is about equal to that of milo maize or kafir, but it is softer and easier for animals to masticate. Feterita yields the least grain per acre (1700 to 2000 pounds), milo more heavily (2200 to 3300 pounds), and kafir most (2800 to 4000 pounds). For silage kafir will yield more tons per acre than either milo or feterita. Kafir yields the best forage, feterita next and milo the poorest. Feterita is frequently planted very early in the season to give an early crop of green feed."

Another sorghum that is creating a great furore is Sudan grass. The tales of its production and the yields of hay per acre have the sound that Easterners are wont to ascribe to all California stories. However it is worth looking into carefully and a trial patch will doubtless be instructive as to value for future use. Seed of this and also feterita may be secured of seedmen advertising in the Cultivator

A bit of personal experience with Egyptian corn last summer may be instructive as to the use of dry fodder. July first I planted a little to grow corn for chicken feed. Because of lack of irrigation it was slow in maturing and it was not cut until November. As it lay on the ground after cutting I offered the fodder to a neighbor for his cow if he would cut off the heads for me. He spurned my generosity, saying the fodder was no good. His advice was to throw the stuff into the orchard where the chickens could harvest the corn and then burn the stalks. But I had other ideas. I hauled it into the barn and on a rainy day cut off the heads. Then I tried the dry fodder on the horse, and much to my surprise he ate it with relish. I gave it to him at noon as a relish until it was all gone. The horse is still alive and has the reputation of being the fattest horse in Santa Clara County.

Indian Corn

Many sections will produce maize in profitable quantities even without irrigation. This is especially true along the coast where chief dependence is placed on the pasturage of hill ranges and where the major milking season ends by July for lack of green feed. Level patches of adobe soil which are so frequent among the hills afford a place to grow summer crops. and Indian corn is about the easiest and best thing to grow. With good cultivation it yields in the neighborhood of ten tons of green forage per acre and its most economical use is to place it in a silo. It is not always necessary to confine the corn plantings to the low, level fields of adobe. This soil, or the redder soils on the lower rolling hills, will produce well if plowed and cultivated at such times as to conserve all the moisture. The corn is best planted in hills in order to make cultivation both ways possible—and then cultivate frequently. Once each way every ten days is not too often.

During several years of experience in San Luis Obispo County I found some difficulty in judging when the corn had best go into the silo. Theoretically the corn plant contains the most available food value at the stage when the kernel is just coming into the glaze period. This is the time when it should be cut for siloing. However, when there is no irrigation, the stalk and leaves toward the bottom may begin to dry before glazing time, which means that the lower portion of the plant may become so hard and woody that the cattle will not eat it. One season I allowed the grain to become more mature (glazed) and the lower stalk to dry and then ran water into the silo when filling. But the silage did not seem to be so good nor so well relished as when the corn was cut with the kernel less mature, say in the milk, and before the stalk had dried to any extent.

Throughout the entire coast region from Mendocino south, Indian corn offers a means of prolonging the milking season and moreover, extending it into the time of higher butter prices in the fall. The corn may be cut and fed green or siloed. Some of the earliest silos in the state were built in the Two Rock district west of Petaluma and King Corn was the plant used.

Root Crops

In Humboldt County on the Eel River bottoms where the cool summers won't let corn grow, roots reach their highest California development as supplementary dairy feeds. Turnips, beets and carrots are the three stand-bys, though turnips are on the taboo list because they insist on carrying their flavor through into the butter, and somehow people who eat butter don't like to know they are eating turnips. But the cow man likes turnips because that root is the earliest ready for consumption. If the pastures begin to dry the last of June, turnips are ready to feed, and that is what the Humboldt dairymen raise roots for—to feed whenever pastures are waning and during the winter when there is little else than dry hay. The large stock beets, golden tankard or yellow globe, and carrots are the mainstay, and every dairy has its acreage depending upon the number of cows. In June it is a common sight to see all hands and all the boys and girls in the family on hands and knees weeding the beets and carrots. It is an illustration of the energy the Humboldt dairyman puts into his business to produce high grade cows. If dairymen of other sections were of similar mind and ingenuity the average production of California cows would be much higher than it now is. The roots are fed in the pasture fields or barn mangers, chiefly in the pastures when the ground is dry and in the barn after rains begin. The cows are allowed to cut the roots for themselves in the field, but in the mangers the dairyman usually helps them a little with a spade.

Pumpkins, Etc.

For a discussion of this topic let me refer the reader to the Cultivator of January 21, 1915. There I said I would not grow beets for cows if I could possibly avoid it. I am inclined to think the Humboldt dairyman would not grow beets if he could find another crop more easily grown that would produce an equal amount of milk. As a basis for this opinion I need only to cite the practice of dairymen from Humboldt who have moved to the San Joaquin or Sacramento Valleys. The root habit doesn't stick to them at all well and they take to alfalfa, corn and such as a duck takes to water. Growing roots is hard work and expensive as compared to corn and alfalfa and if there is only a silo in which to preserve the corn the cow is just as happy as though she were eating beets out of a silver cup.

SURFACE IRRIGATION

PIPE *"BUILT TO LAST"*

Body made from single sheet of Galvanized Open Hearth Steel 10 feet long, with extra heavy taper collar on one end and band of heavy steel on the other—making each section 10½ feet. Made with lock seam (four thicknesses of steel), which gives unusual strength and durability, besides—
ABSOLUTE PROOF AGAINST LEAKAGE.

Citrus and Tropical Fruits

MEETING OF WESTERN AMERICAN PHYTOPATHOLOGICAL SOCIETY

Written by Wm. T. Horne, Secretary of the Society

LAST summer at the Fruit Growers' Convention at Davis a society was formed for the technical and practical study of plant diseases for the Western states. During the past winter a meeting of this society was held at the Oregon agricultural college at Corvallis at which representatives were present from Oregon, California, Washington and British Columbia. Four very interesting sessions were held and the visiting members were entertained at a banquet on the evening of December 29. The first program took up largely the matter of pear blight, and the three sessions of the following day followed the program, together with discussions of the matters brought up. The program as presented follows:

Investigation of Physiological Plant Diseases by R. E. Smith. Discussion in which Mr. Easthem described the little leaf disease of apples.

Wilt Disease of Carnations by C. J. Wight. Read by the secretary—A paper published in Pomona College Journal of Economic Botany, Vol. II, No. 3, September, 1912. A disease not so serious as formerly and controlled by proper cultural methods.

Sappy Bark Disease of Apples and Polystictus Versicolor by Wm. T. Horne and C. J. Rodgers. Describing the injury caused by polystictus versicolor in apples in California.

Melaxuma of Walnuts by H. S. Fawcett. Read by R. E. Smith—A canker disease of English walnuts in certain parts of Southern California, known also as black sap. Causative fungus isolated and the typical disease produced, but the fungus not certainly identified as yet. The same fungus found also on willows.

Preliminary Studies of Resistance of Prunus to Inoculation with Bacterium Tumefaciens by C. O. Smith Read by R. E. Smith—Mainly giving results of inoculation experiments.

A New Filbert Disease in Oregon by H. P. Barss. Since published in Second Biennial Crop Pest and Horticultural Report, Oregon agricultural college experimental station, 1913-1914.

Notes, Observations and Investigations of Plant Diseases in Western Washington by H. L. Rees. Discussed diseases due to sclerotinia perplexa and other fungi. Called attention to the curious behavior of cane crown galls which are especially bad in Himalaya berry.

Minor Notes on Interesting Diseases by H. S. Jackson. Mainly published in Second Biennial Crop Pest and Horticultural Report, Oregon agricultural college experiment station, 1913-1914.

Inoculation Studies with Apple tree Anthracnose by H. S. Jackson.

Warnock's Tree Paint as a Cure for Fire Blight by J. W. Hotson. Read by H. S. Jackson—Results not indicating efficiency of the material.

Internal Brown Streak of Potato by S. S. Rogers. Read by R. E. Smith—Mainly endeavoring to find methods of avoiding trouble by seed selection, cultural and similar methods, none of which are entirely effective.

Cottony Rot of Lemon (Sclerotinia Libertiana) by C. O. Smith. Read by R. E. Smith—Giving results indicating the identity of the fungus with sclerotinia libertiana from several widely separated places and from various plants. Various inoculation experiments and tests of fungicides for protecting lemons.

The Prevention of Wood Decay in Trees by W. T. Horne. In discussion of questions raised by this paper Mr. Rees stated that he was convinced by observing different methods of treating wounds that those which were promptly covered with a good plastic wax started to callus over much more promptly than those not treated.

Apple Scab Spraying Experiment in the Hood River Valley by J. I Winston. An account of experiment carried on in an exceptionally u fortunate season. Discussion by Pr fessor Jackson showed the scientifi value of the results.

Very many interesting facts wer brought out concerning the disease which occur commonly throughou the region. Some troubles appear i the more rainy parts of the Pacifi Coast which do not occur elsewher whereas on the other hand the drie sections have troubles which are no serious in the more rainy districts

The society is to hold its next mee ing during August in San Francisc and arrangements are now under wa for a joint meeting with the nationa society for the study of plant dis eases, the American Phytopatholog ical Society.

While these programs are in th main technical, they take up man practical phases and their purpose is entirely to discover useful facts and to keep the workers on plant dis eases in close touch with one another so that duplications of effort may b avoided and that mutual help ma add to the efficiency of the work o all.

OLIVE PRUNING

Olive culture is of much interest in New South Wales. From a bulletin of its department of agriculture we quote:

This important branch of work has been very much neglected in many districts where olives have been plant ed, as the growers are of opinion tha this tree does not require pruning. If the olive receives regular annual pruning, either light or otherwise, ac cording to the growth which the tree has made, it will be found the trees will crop more regularly than where they are left to their own sweet will, when they usually crop every other year.

The trees should be pruned every year, but it will be found that some varieties require the knife more than others. This work is best done as soon as the crop is disposed of, or not later than the 1st of August (in New South Wales).

The object in pruning should be to keep the tree just so open that it can develop fruiting wood all through the tree, as well as to keep it from growing too high, as the lower the tree is the more easily the fruit is picked. Therefore, from the time the tree has attained the height of four or five feet, the pruning should commence with these objects in view, viz., to keep it as low as possible without too many main branches, and with the fruiting wood distributed evenly through the tree. The olive bears its fruit on wood of the previous year's growth; the problem, therefore, for the pruner is to regulate the number and kind of branches on the tree, and only a sufficient number of wood branches are left to shape the tree, and to subsequently furnish a place for fruit branches. It is found the vertical branches are practically sterile, while the horizonal branches bear the fruit.

No hard and fast rule can be laid down for each tree or kind, as one tree may require to be severely cut, while another may only require a little pinching back. If a tree is too thick in the centre, no fruit will set inside—in fact, no fruit will set where the sun and light (which are the principal agents of fructification) cannot penetrate freely.

The military post in the American island of Guam is engaged in farming and gardening on the side. This gives suggestion as to where our standing army may be able to work off some of its excess ambition by growing its own garden sass. Why not have a good sized garden in connection with each barracks and detail corporals and some others to get some good healthful exercise?

IRRIGATION APPLIANCES

The 20th Century Method of Irrigation

A SPRAYING SYSTEM FOR FLORIDA

In order to minimize the damage done by insect pests to citrus fruits in Florida, which on the average amounts to from 25 to 40 per cent of the crop, the department of agriculture has worked out a spraying scheme which has given striking results in the three years it has been practiced.

Practically all of the damage that insects do to citrus fruits in Florida can be attributed to six species. The most destructive is the citrus whitefly; the second the purple scale; and the third the rust mite. To do away with these pests government specialists advocate four sprayings, two of which are primarily intended to kill the whitefly and scale insects and the other two to destroy the rust mites. The number of sprayings, however, is not fixed but depends to a large measure upon the thoroughness of the work and the seriousness of the infestation.

The first spraying should be done in May after the adults of the first brood of whiteflies have disappeared and before the appearance of those of the second brood. At that time the fruit should be an inch or more in diameter. A paraffin oil emulsion is used, prepared in accordance with the formula described in Bureau of Entomology Circular 168. Following is the formula: Whale oil soap, eight pounds or one gallon; paraffin oil, two gallons; water, one gallon.

The mixture is prepared by adding the oil very slowly to the soap, the whole being vigorously stirred throughout the process. It is important that the oil be added in small quantities and the stirring be sufficient to keep oil and soap in the form of an emulsion. After the required amount of oil has been added and after free oil has ceased to appear on top of the soap, the water is slowly poured in. After being prepared in this way the mixture is diluted by the addition of 50 gallons of water to one of mixture, which leaves a spray approximately one per cent oil. This is the maximum strength required for whiteflies and purple scale.

In June and July the rust mites should be attacked by a lime-sulphur solution of the strength of 1 to 50 or 1 to 75. This spraying should be done when the maximum number of rust mites have made their appearance and before any russeting appears. It will also kill some scale and whiteflies, but should not be relied upon for this purpose. Some time between August 25 and October 31 the trees should be sprayed again with the paraffin oil emulsion in order to kill all the whitefly larvae which are the progeny of the third and last brood. The earlier these are killed the better it is for the tree. This spraying will also serve to remove the sooty moulds from the trees and from the fruit, enabling the sun to color it.

In November or December it is frequently desirable to spray again with the lime-sulphur solution in order to kill off what rust mites there may be.

The cost of following such a scheme is estimated at from 20 to 35 cents a year for each tree. One grower was able to carry it out at a cost of three cents per box of fruit, and on the other hand it cost another eight cents. Eight cents may be taken as the maximum figure. In return for this outlay the trees yield not only more abundant but much larger fruit. The increase in the size of the fruit alone should result, it is estimated, in an increased production of from 12½ to 25 per cent, amounting approximately to 2,000,000 boxes for the entire citrus crop in Florida. If this scheme was followed throughout the entire state it is thought that the output would be at least 25 per cent greater than it is now, and that the appearance of the fruit would also be much better. In one orchard, sprayed rows yielded 60 to 70 boxes of fruit while adjoining rows which were left unsprayed had only about five boxes.

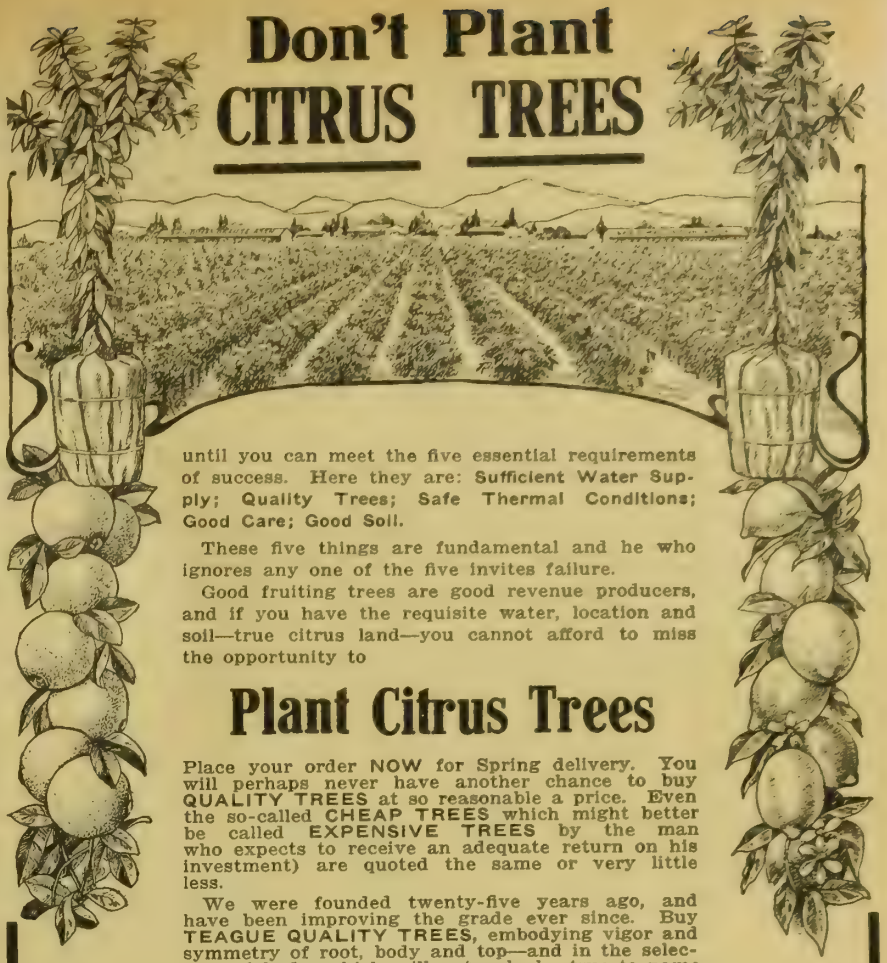
EXPLAINED

"Have you ever noticed how a bum actor can get laughter and applause by using a cuss word?"

"Oh, yes. What's the reason?"

"I've found out, I think. The audience has been wanting to swear, but is too polite."—Toledo Blade.

Don't Plant CITRUS TREES



until you can meet the five essential requirements of success. Here they are: Sufficient Water Supply; Quality Trees; Safe Thermal Conditions; Good Care; Good Soil.

These five things are fundamental and he who ignores any one of the five invites failure.

Good fruiting trees are good revenue producers, and if you have the requisite water, location and soil—true citrus land—you cannot afford to miss the opportunity to

Deciduous Fruits

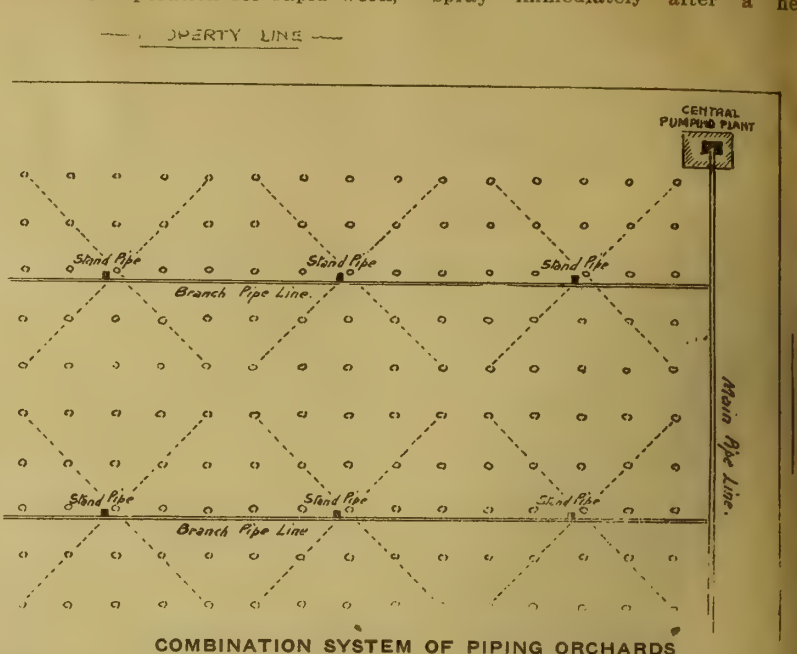
A NEW METHOD OF ORCHARD PROTECTION

Written for California Cultivator
By Wm. H. Kritzer

FOR spraying this system is one of the most practical and economical ever devised and has been found desirable for use in large orchards that have soft soil and are difficult of spraying by the wagon method at the season of the year when spraying is necessary to insure a good fruit crop.

In laying out the system for spraying only, pipe of small size is used for branch pipe lines, those extending from the main line pipe leading from the central pumping station. These pipes are laid at a depth that will not be reached in the plowing or cultivation of the soil and in direct line with the trees; one line of pipe along every fifth row in the orchard, depending upon the kind of trees planted and the amount of space used in setting them out. At each third and fifth tree, in every line of pipe a "T" is placed on the small lateral pipe lines, to which is connected a short standpipe extending out of the ground and up close to the tree, and having a gate valve, stop cock, or gas burner attached to it so it will not interfere with the cultivation of the soil, and so arranged that when connected with a small hose it will permit one man to spray the group of trees five trees square in a short time, unless the orchard has been set out on a different plan.

If it should be desirable to accomplish the work quickly, a large number of laborers can be employed to do the spraying providing enough hose is furnished, for the system is practical in operation for rapid work, and the insect pests have little terr to the orchard owner who has one these systems installed, for he c spray immediately after a hea



COMBINATION SYSTEM OF PIPING ORCHARDS

rain, which is an excellent time do the work. Spraying must be do thoroughly and at the right time be effective, usually in advance of t infection period of the fungus pests that are troublesome in a ce tain locality. Most of these inse pests can be controlled by sprayin well-known mixtures at certai stages; the egg stage, larval stag pupal or resting period, and adu stage—A knowledge each orchardi should have in order to spray inte ligently, thoroughly and at the rig time.

It requires very little more electri or engine power to operate a pip system than to operate a portabl spraying outfit. There should be supply tank that will hold severa hundred gallons of the spraying mix ture that is to be used, also an auxil iary resevoir which will hold a smal er amount that can be kept in con tinuous agitation for immediate use

When a start is made to spray, es pecially in a large orchard, the wor should be carried through as quickl as is convenient, as it pays to kee the spraying mixture going throug the pipes steadily from the start, fo if operations are stopped or muc time lost during which the sprayin solution is not in circulation, the in soluble portions may settle and clos up the pipes. For this reason ther should be two shifts of men wit the work so arranged as to keep it go ing continuously. After the sprayin is done the pipe system and hos should be thoroughly flushed out t prevent deterioration of the plant and appliances.

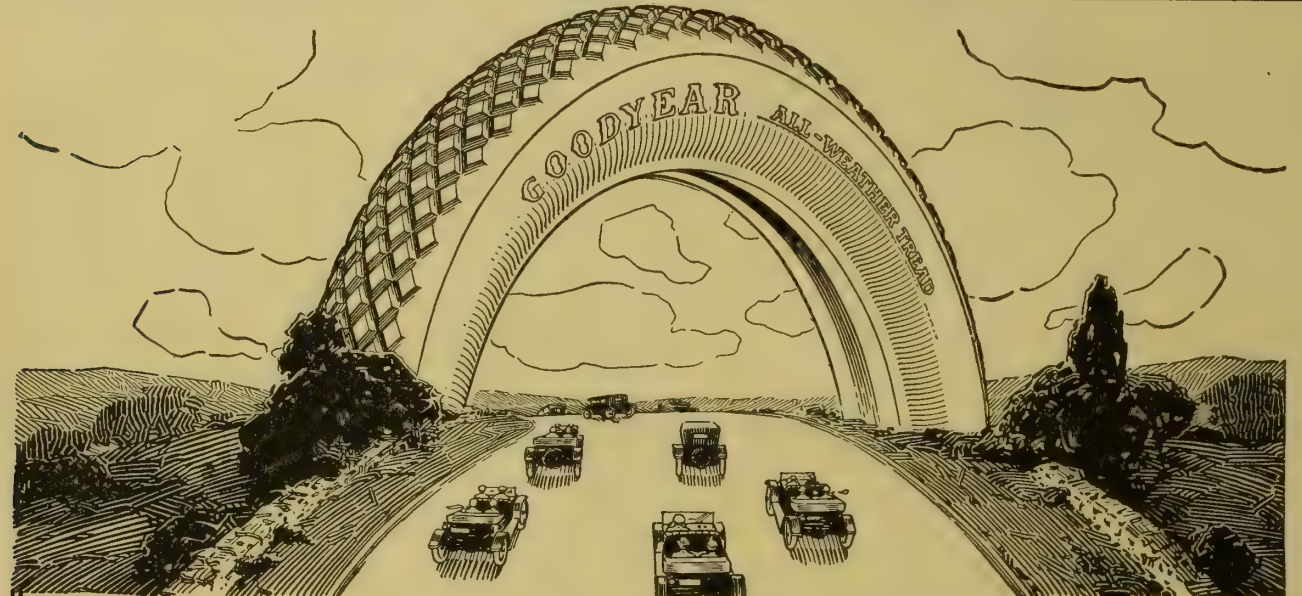
With the proper attachment on each standpipe for holding a non-combustible material that will convert a gas into a smudge or smoke the same piping can be utilized, as the gas is generated at the same central power plant, placed under sufficient pressure to force it through the piping system to all parts of the orchard. A small corps of men can, on receiving report that a fall in temperature is due or a frost is predicted, quickly light all the burners, or it can be arranged to do the work by an electric device made for the purpose.

Should the owner of an orchard desire it, the system of piping can be arranged and installed with pipes of sufficient size to use it for irrigation purposes also, but this idea should not meet with favor for the reason that increased size of pipe would mean a considerable loss in spraying mixtures and some loss in gas when it was converted over to this work.

FRUIT TRADE SINCE WAR BEGAN

By State Statistician George Robertson

At the beginning of the war in August last, it was confidently predicted in many quarters that there would be a great falling off in the foreign trade in fruits, especially in imports. The following brief summary, which has been compiled from the latest reports, shows that instead of a decrease in fruits and nuts during the past twelve months there has actually been a slight increase compared with the previous two years. For



The Road to Tire Content
Join the 400,000 Who Take It

This spring we urge you, for your own sake, to find out the advantage of Goodyear Fortified Tires.

You know they must have an advantage. They have long outsold any other tire. Last year about one-fourth of all tires sold for pleasure cars were Goodyears. Yet we have a hundred rivals.

You know that a tire which dominates like that must be a super-tire.

In five ways Goodyear Fortified Tires conspicuously excel. On these five features—each exclusive to Goodyear—we spend millions of dollars. And we do it for your protection.

One way combats rim-cutting. It has probably saved the ruin of a million tires.

One saves needless blowouts. That one feature—our "On-Air" cure—costs us $450,000 yearly.

One, by a patent method, combats loose treads. One makes the tire secure. And one is our All-Weather tread. That is tough and double-thick, to resist both wear and puncture. And the sharp-edged grips give the utmost in anti-skids.

All these trouble-saving features belong to Goodyear tires alone.

Big Price Reductions

On February 1st we reduced our prices for the third time in two years. The three reductions total 45 per cent. Now our mammoth output enables us to give you the greatest value ever known in tires.

Goodyears are handy to you. We have stocks everywhere. And any dealer who hasn't stock can get them for you quickly.

This season get their protection. Get their savings in trouble and upkeep. Know what tire contentment is.

They can't avoid all mishaps, but they will save you many a trouble, many a dollar. They are doing that now for some 400,000 motorists. Let them do it for you.

After one season with Goodyears, you will never go back to a skimped tire. And never to a tire that lacks Goodyear protections. Be fair to yourself and prove that.

GOODYEAR
AKRON, OHIO
Fortified Tires

Fortified Against:
Rim-Cuts—by our No-Rim-Cut feature.
Blowouts—by our "On-Air" cure.
Loose Treads—by many rubber rivets.
Insecurity—by 126 braided piano wires.
Punctures and Skidding—by our double-thick All-Weather tread.

Makers of Goodyear "Tire Saver" Accessories; also Goodyear "Wing" Carriage Tires and Other Types

e months of December however ere is a decrease in value of $700,-)0, compared with 1913, but an in-ease compared with 1912, of $276,000. reek currants show a small increase r the year and the raisins imported ere only 309,000 pounds more than in e previous year, but the total quan-ty imported of late years only nounts to some two or three million ounds, which is so small compared ith the California crop as to be of ttle importance, and vastly different om the 40 or 50 million pounds im-orted a few years ago.

The quantity of figs shows a small crease, olives an increase of over vo million gallons, while lemons and anges both show a decrease, the alue of the latter falling from $253,-)0 to $52,000.

The exports of domestic fruit during ie year show a decrease in value of ,045,000, but for the month of De-ember an increase of $568,000 com-ared with the year 1913.

The principal changes were a fall-g off in dried apples of from 38,000,-)0 pounds to 31,000,000 pounds, dried pricots from 21,000,000 pounds to ,000,000 pounds and prunes from ,000,000 to 35,000,000 pounds. On the ther hand lemons increased from 58,-)0 boxes to 94,000 boxes, oranges from)5,000 boxes to 1,800,000 boxes; dried eaches from 5,100,000 pounds to 7,200,-)0 pounds; and raisins from 16,500,-)0 pounds to 21,600,000 pounds, a uantity which has only once been ex-eeded, viz. in 1912, when it amounted) 28,000,000 pounds. Canned fruits re-ain steady, the total value during the ast three years being about $5,000,-)0, the year 1914 showing an increase f $297,000. For the month of Decem-er the exports show an increase of 568,000.

CALIFORNIA ASSOCIATION OF NURSERYMEN

Secretary Kruckeberg of the Califor-ia Association of Nurserymen is send-ng a list of standing committees ap-ointed by President Howard. There re committees on legislation, insects nd diseases, transportation, deciduous ruits, citrus and tropical fruits, viti-ulture, California gardens, plants and lowers, native vegetation, arboricul-ure, nomenclature, exhibitions and rogram. These committees will re-ort at the next annual.

Accompanying the announcement of ommittees is a roster of members of he association. There are now 134 ctive members.

NEW METHOD FOR FUMIGATING IMPORTED SEED

A satisfactory method for destroy-ng injurious insects in imported seed ithout affecting the value of the seed as been used by the United States epartment of agriculture and is de-cribed in a new bulletin (No. 186), ntitled, "A Method of Fumigating eed." Interested individuals who ap-ly to the department at Washington, . C., will be sent the bulletin.

In the new method the infested seed s placed in a chamber in which a par-ial vacuum has been created. The hamber is then filled with a very eadly gas, hydrocyanic acid, which enetrates more effectively into the eed because of the previously created acuum. It has been found that a onsiderably shorter exposure was ecessary in using this method of fu-nigation than in the usual method. The bulletin describes the experiment ompletely, giving details and illus-rations of the chamber used in the xperiment.

Hydrocyanic acid is of course a most angerous poison and should not be andled by any except those who are horoughly familiar with it. Another as, carbon bisulphid, is to be used by he department in a similar experi-nent, the results of which will be an-ounced later.

The services in the chapel of a cer-ain Western university are from time o time conducted by eminent clergy-nen of many denominations and from many cities.

On one occasion, when one of these visiting divines asked the president of the university how long he should speak, that witty officer replied:

"There is no limit, doctor, upon the time you may preach; but I may tell you that there is a tradition here that the most souls are saved during the first 25 minutes."—Lippincott's.

Don't Delay - send in your order for TREES now

If you don't wish to be disappointed in receiving the varieties you expect to plant this season —— We urge you to send us your order NOW.

Surplus Stock—Special Prices

We have heeled in at our packing grounds a complete line of deciduous fruit and ornamental trees, small fruits, grape vines, and roses. Write us at once for our Surplus List and Special Clean-up Prices on this stock. The trees are in perfect condition and ready for immediate shipment.

OLIVES

We have a fine stock of Mission and Manzanillo, and every prospective planter should get in touch with us before placing his order. Trees can be delivered either from our Fresno or Los Angeles Nurseries. Special quotations for stock in any quantity.

Our Book for Planters

"Roeding's Practical Planter's Guide, the Result of 30 years' experience in California Horticulture," contains complete cultural instructions with illustrations showing "before" and "after" pruning. The regular price of the booklet is 25c, but if you send us your list for prices and suggestions, we will send you a copy free. Write us today.

Illustrated Catalogue Free

for the season 1914-1915 is FREE, fully illustrated. Contains 60 pages and briefly lists and prices all stock carried by us, consisting of over 2000 varieties of trees, vines and plants. A copy will be sent free to any address upon request.

THE COST OF AN ACRE OF RICE

Written for the California Cultivator
By Sacramento Valley Contributor

HOW much does it cost to grow rice? is a frequent question in the Sacramento Valley. Unless a great many farmers change their minds there will be a big acreage planted in 1915, thousands of acres of land that has been used for sheep pasture for years—not because it is not rich in the elements of fertility, but because it is so heavy and hard to handle that a grain crop is a gamble. If the season is just right and rains come so that it can be plowed satisfactorily and a good seed bed can be prepared, a bumper crop may be the result. But if it must be plowed too wet or too dry in order to get the crop in at all, and because of poor plowing a poor seed bed is prepared, a crop failure may result.

It has now been demonstrated that with water this land will raise big crops of rice, yields often being 40 sacks per acre or more, double the average in most rice-producing countries of the world.

The following figures on the costs of various rice-growing operations approximate the average for the Sacramento Valley. It must be remembered in considering them that on any particular piece of land there may be a difference in some features because of different conditions.

These are per acre costs:

Plowing	$3.00
Preparation of seed bed—disking, harrowing, etc.	1.35
Checking land with rough contour borders for irrigation	3.00
Drilling-in seed	.75
Boxes in ditches for control of irrigation water	.50
80 lbs. seed at 2 cents per lb.	1.60
Care of crop (labor of irrigation etc.) April to Sept.	4.00
Twine for binding	.40
Harvesting grain with self-binder	2.00
Shocking bundles	1.00
Threshing 40 sacks @ .20 sack	8.00
40 sacks @ .10	4.00
Hauling from field to warehouse	3.00
Irrigation water—5 acre feet at $1.00 per foot (This will vary—pumping will generally cost more. The cost at Biggs is $1.00 per acre foot.)	5.00
Pulling weeds	1.25
	$38.75

Land rents for $5 to $15 per acre cash or one-third of the crop, the landlord to furnish the water.

James Mallon of Princeton in Colusa County and his associates are preparing now to plant 4000 acres next season, and many others on both sides of the valley are busily engaged in getting ready for the 1915 crop.

MADE MOST MONEY

Written for California Cultivator
By Milo Hunt

To Albert Jackson of the Whittier Union High School belongs the honor of having made the best financial showing of any boy entered in the agricultural contests as fostered by the state university of California last year. Young Jackson is a senior in the Whittier school and made a record of a net profit of $66.87 from a quarter of an acre of ground during the past season. Ten fellow members of the school entered the school, but Albert Jackson outstripped them all. He did it with corn, egg plants and bell peppers, but the egg plants proved to be the "big money" crop. Jackson's record was made at the rate of $267.48 per acre, but this egg plant patch gave a net profit at the rate of $698 per acre. The record established by this young lad from the Quaker City leads easily all the records made last season in this state.

Undoubtedly a large part of the success of the winner came from the fact that he used his head as well as his hands. In planning his contest cr s he says:

"When I decided to go into the c test the first step I took was to m a thorough investigation of the m

planted the three crops so that if one should fail I would have the others to depend on. Peppers and egg plant bear continuously, so it was possible to market the crop at different times." A part of the contest requirement was that each contestant should keep an accurate account of all labor, and other expenses, and an account of all income from sales of produce. All labor was charged against the crops at the current day rates, likewise with irrigation, seeds, plants, etc. Every participant in the contest speaks highly of the value of accurate accounting in crop production and marketing. The winner says: "While I have learned many things from my garden, I think the most important is the value of keeping books. There is not a single business man who would think of running his business without keeping books, so why should a farmer not do so?"

UNIVERSITY FARM PICNIC

The famous stock parade on the afternoon of Saturday, April 24, always a feature of the University of California's annual farm picnic, is expected to bring together not less than 5000 admirers of the university's high-y pedigreed dairy cows, sheep, horses, goats, swine, beef cattle, and other livestock representing the best achievements of the breeder's art.

All manner of other interesting sights are to be shown—barns, stables and poultry plant, choice orchards, a vast variety of table, wine and raisin grapes, improved irrigation and pumping methods, field crops, farm shops, farm machinery, and the work of a creamery where butter, cheese and ice cream of the highest quality are made by the students.

The farm picnic plans are being worked out through cooperation between the 288 students in the three-year course of the farm school and the 75 students from the college of agriculture at Berkeley who are spending the present half year at the university farm.

The junior contests in judging livestock will begin at 9:30 a. m. on April 24. There will be athletic events, too, and speechmaking. At noon the picnickers will have their basket lunches on the broad lawns. At 1:15 will occur the stock parade.

KILLED THE SQUIRRELS

Mr. W. C. Heim of Dehesa writes of successful experiments in killing squirrels with distillate.

I had been told that a good and cheap way to kill the squirrels was to take an old rag and saturate it with distillate, shove it down in the hole and stamp it tight shut, the fumes from the distillate would do the rest. I was a little skeptical when I first heard it and determined to find out. The other day I ran a squirrel into its hole and then got the rags and distillate and proceeded to fix him up. After waiting two days to see if he would dig out I got anxious and proceeded to dig him up. Just below the rags were two large squirrels dead. I was convinced.

The farmers' club can be made the starting point for cooperative enterprises. It can be used to secure the farmers the benefits that big business secures from doing things on a big scale. Many have the idea that nothing can be done unless there is a big organization. This is a mistake. The successful cooperative enterprises have come from small beginnings.

The state of Iowa has passed a measure appropriating $16,000 additional for the live stock show of the Panama-Pacific International Exposition. Iowa's previous award to the exposition was $75,000.

Standard Cyclopedia of Horticulture

SOME 15 years ago the Macmillans issued the four-volume edition of the Cyclopedia of American Horticulture. It was edited by Liberty H. Bailey, at that time professor of horticulture at Cornell. The purpose of the work, as announced, was "to make a complete record of the status of North American horticulture as it exists at the close of the nineteenth century," and, in addition, "it was an effort to include all the species which are known to be in the horticultural trade." Of course there were errors in it and experts and all the rest of us could make suggestions. We doubt not many suggestions were made. Whether or not they were, now comes the offspring of the old four volume edition in a new one, or rather an entirely new book, the Standard Cyclopedia of Horticulture. It is a six volume edition, and while founded on the former compilation the editor wishes it understood that it is an entirely new work with a greatly enlarged scope and the older work will no longer be published. "It nevertheless stands by itself, and the two should be quoted as independent cyclopedias. The geographical boundaries are wider in the present work, due to the fact that the United States and England have both acquired new tropical connections and interests in recent years. It has not been the effort to cover completely the horticultural floras of Porto Rico, Hawaii, and other islands, for that would involve the tropical flora of the globe; but it is the intention to include the most outstanding species grown in a horticultural way in those islands. A fuller treatment has also been given of the plants grown in Southern Florida, Southern California and the other southernmost areas of the continental United States."

This work is of such magnitude that the editor and his large force of contributors and helpers and one of the largest publishing houses of the world are finding the task of completion no small one.

The work consists of six volumes of about 600 pages each. It is published at six dollars per volume. As yet only two volumes are ready for delivery by the publishers. The third is due either this month or next. The other three will follow as rapidly as possible. The Cultivator has arranged with the publishers to supply its readers with these volumes as rapidly as published. Where preferred terms will be made permitting of monthly payments. It is a book which should be in the library of every California farmer or fruit grower, for everyone who comes in contact with products of the soil will meet questions, the answers to which may be secured in this cyclopedia.

It is not exactly a companion for the Cyclopedia of American Agriculture, also edited by Professor Bailey, but both these books are invaluable though along materially different lines. The books are practically the perfection of the bookmaker's art though no effort is made toward the de luxe.

Volume I opens with explanations, abbreviations and other general matter pertaining to the book. Then follows a synopsis, giving divisions, classes, orders and families of the plant kingdom. This feature of the work which is invaluable to the botanist, requires 78 pages. Then comes the key to the families and genera, requiring, with its index, about as much more space. Then comes a name list with English equivalents for Latin names, then a glossary of botanical terms, all told taking us to page 171 where the cyclopedia proper begins. This contains the names, botanical description, cultural directions and illustrations of almost every plant grown. The text has been edited with great care. It is printed in clear type, and practically every page has from one to a half dozen illustrations, and there are many colored plates.

In closing his preface Mr. Bailey says:

"It is not wholly with satisfaction that one puts forth a work of this magnitude. The responsibility increases with the largeness of the enterprise, for users do not readily purchase new and corrected editions of a work of this extent. Every care has been taken to present an accurate and faithful account, and this is as far as the responsibility can extend. The editor can not expect to make another cyclopedia of horticulture; but he hopes that these six volumes will comprise another step in the collecting, assorting and appraising of our horticultural knowledge."

Johns-Manville Service and Responsibility have been my greatest asset in assuring roofing satisfaction
J. N. Gundlach
of the Gundlach Machinery Co.,
Belleville, Ill.

Everyone around Belleville, Illinois, knows this contractor and knows that a Johns-Manville roof is a roof you can depend on because of

J-M Transite Asbestos Shingles
Fire- and Weather-proof, last forever. Highly artistic.

J-M Asbestos Ready Roofing
Weather-proof, fire retardant, needs no coating. First cost only cost. For roofs of permanent character.

J-M Regal Ready Roofing
"Rubber-Type" roofing. Best of its class.

J-M Roofings for Every Requirement

J-M ROOFING Responsibility

When you put a J-M Roof on your building and register it with us, its long life and efficient service become *our* responsibility.

Every J-M Registered Roof, no matter where it may be located, is systematically kept under our care.

The tremendous size of the Johns-Manville field force, with its representatives everywhere, enables us to give this unique service and in the fullest practical sense to live up to our idea of J-M Responsibility.

J-M Asbestos Roofings are more than weather-proof. They give fire protection also. Sparks and flying brands will not ignite them.

J-M Asbestos Roofings are examined by Underwriters' Laboratories (under the direction of the National Board of Fire Underwriters).

We want every J-M Roof Owner to register his roof with us so we can see that it gives him real J-M Roofing Service. Tell us what kind of building you have to roof and we will tell you the type of roofing that has given the best service on similar buildings during our experience of more than a half century.

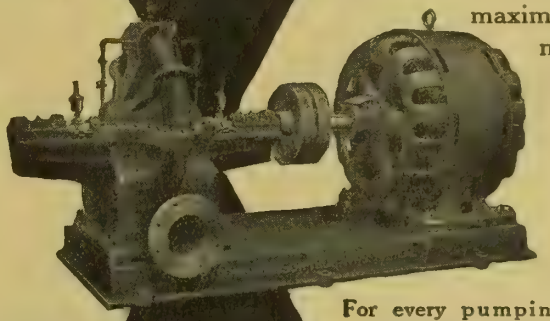
"Jackson MADE"



A Better Make Not Made

The fidelity and regularity with which a "Jackson Made" pump does its work is almost human—no attention is needed—it simply goes on pump, pump, pumping—hour after hour delivering the maximum amount at the minimum expense.

Tell us your pumping problems and our expert engineers will gladly help you free of cost.

For every pumping condition there is a "Jackson Made," which, in satisfactory results, absence of repairs and costly upkeep, excels every other make.

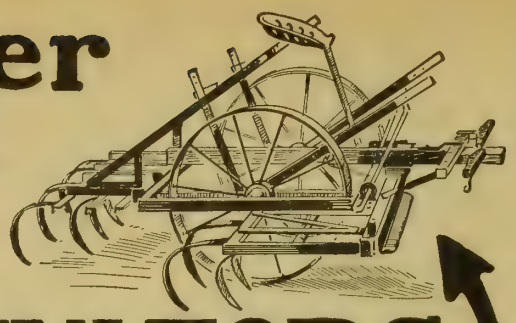
Forkner Light Draft CULTIVATORS



— *cut cultivating costs in two*

For Orchard, field and alfalfa work there is no other cultivator that will give such splendid satisfaction as the Forkner. It has many special features, chief of which is the light draft; it works close up to trees, cultivates perfectly, is easy to operate. Construction is strong but simple. Driver may walk or ride at will.

The Lawn and Flower Garden

THE GARDEN SPIRIT

Written for the California Cultivator
By Ernest Braunton

ONE of the chief requisites to gardening operations is the assumption of the proper mental attitude toward the work. Let us begin our garden-making in a sympathetic spirit, seeking to cultivate contentment and peace of mind as well as the soil; to love plants and take pleasure in caring for them; to find relief and relaxation in all gardening operations.

Let us do the best we can with what is at hand or may easily be found, nor strive for the spectacular or regard our work as a task or as a weighty problem. In short, let us be happy, however much or little we may do, for if we make our garden beautiful we shall learn to love it, whether our efforts be confined to the care of a window-box or lavished upon broad acres.

Let us be governed by a desire to please and satisfy, not alone ourselves, but others, not by gaining unusual or unnatural results, but by making all so simple and homelike that every visitor will enjoy the quiet restfulness and sufficiency of the whole, the charm of response to every simple and natural desire. Do not attempt too much. Before beginning the plan—for every garden should have a plan before any work is done—set down upon paper all the things you feel an attractive homelike garden should have.

This does not mean a list of the plants and flowers you wish—such are mere incidentals — the material with which you build and finish the picture. Begin with fundamentals. Lightly sketch where paths are needed, and have none you do not need. Provide for comfort, interest, even instruction. Will you have an arbor, one or more garden seats, and where? Are you interested in sun-dials? If so, have one by all means, for there is no place on earth where the sun shines more than in California, and therefore we may make more use of them than other and less fortunate peoples. Our mild and equable climate allows us to get about the garden with pleasure nearly every day throughout the year.

Have some sort of a water garden, even if no more than a half-barrel submerged to a level with the garden plane; for in a semiarid land having few natural streams, ponds, or lakes, an aquatic feature, however tiny, cannot fail to attract and interest and lend strength and balance to the landscape. Unconsciously we derive a certain amount of comfort from proximity to water, for of all natural elements it is the one most necessary to the preservation of life and health, therefore its simple presence is soothing and satisfying.

Continue Planting Bulbs

Summer-flowering bulbs should still be planted. If you are using many of my favorite, the gladiolus, plant some of them once each month so long as you procure (or keep) the bulbs in dormant condition. It may be that in this way some may be planted too late to get vigorous blooms, but this little experience will be worth all it costs. There are many other sorts of hardy bulbs which may yet be planted and quite a lot of tubers, roots and bulbs of more tropic requirements.

Watch Trees and Shrubs

Deciduous trees and shrubs are called upon for unusual expenditures of natural forces at this time of the year. Deciduous flowering shrubs have a greater call upon their strength than do evergreen shrubs. I have noted in my own garden that when standing side by side it is the deciduous shrub that first shows distress from lack of water. Now that rains are largely past, if you have flowering shrubs in light well-drained soil, see that they do not thirst until flowers and the season's growth immediately following are given all necessary moisture and there by kept on the move until the perio comes for ripening wood growth.

Sow or Resow

So heavy and long-continued wer some of our recent rains that seeds o or near the surface may have bee washed away or exposed to the ele ments to such an extent that few wil grow. If any doubt exists on thi point it is best to resow at once There also remains plenty of time t get good results from seeds of native wild flowers sown now, if you have ordinary gardening facilities for wa tering. In fact, he who has water may grow plants at any time.

Lawn Grasses

All keen observers will agree tha the fine texture, rich green color and smooth even growth of Poa pratensis the Kentucky blue grass, prove it t be more desirable as a ground cove than any other known, and it should be used wherever conditions are fa vorable to establishment and main tenance of lawn grass. The mos closely similar species is P. arachni fera, a Texan species. A substitute used in cheap mixtures, is P. com pressa, the Canadian blue grass. The latter is flatter, more wiry and blue than Kentucky grass and is good on dry sand, clay, or poor soils where the others do not thrive. P. nemoralis the wood meadow grass, is good for shady places in woodlands, yet resistant to heat. In the eastern states Agrostis canina, the Rhode Island bent grass, makes a fine close turf of good color on sandy seasides and should thrive in California. Eastward they also have a "beach" grass known to dealers and botanists as Ammophila arenaria (or arundinacea) that is successfully used on seacoast embankments to hold dry, loose soils and drifting sands. In California the Australian rye grass is much used for shady places and for lawns where less care and water can be given—a lazy man's grass—but inferior to Kentucky blue grass.

White or Dutch Clover

White or Dutch clover is often used to mix with blue grass in lawns. The clover seed, being much heavier, should be sown separately from the grass seed and in quantity about one-fourth as much. Clover is also excellent for control of Bermuda grass. Many prefer a lawn wholly of white clover, and if so a pound of seed will sow very nearly twice the area that a pound of grass seed will. It also thrives with less water and is superior to Kentucky grass for sandy soils and also does better close to the ocean, where it requires still less water than it does inland.

Ferneries and Rockeries

A pleasing variety may be added to any garden by the judicious use of rocks. Build in the open. If the walls are sufficiently abrupt, you may have rock and desert plants on one side and ferns and alpine plants on the other.

If in the country where a wash or ravine could be utilized one may have ferns on the steep, shady, northern walls, alpine rock plants on the more exposed and sloping north exposures; the hot, steep sides covered with rock "wall" plants and the gentler sunny slopes with cacti and other succulents. If skillfully planted such a ravine or gully, no matter how small, could be made a wonderland of suitable plant life under natural conditions.

Herbaceous Perennials

Many of our Eastern visitors miss the old-fashioned herbaceous perennials so common in gardens on the Atlantic Coast and in the Middle West states. Those companions of childhood's years; fox gloves, larkspurs, Canterbury bells, penstemous, columbines, sweet Williams, candytuft, yarrows, goldenrod and a host of

imilar plants make glad the eyes of hose who but a few years ago had eft these plants in their old home fter perhaps a half-century of close ssociation with them. The story of ardy perennials for California is a uch needed chapter in all our local arden lore. Plant them more freely.

Mission of the Vine

It is not only pathetic to see houses ompletely covered with vines but uch condition is frequently conducive o the tragic. Thickly-tangled vines t foot or more in thickness have nade many wooden cottages positive- y unhealthful as places of abode. 'he true mission of the vine is to eautify, not to obscure. Ugly ob- ects may be covered, but man's welling place should never be ugly nough for such drastic treatment. Se it ever so beautiful, the delicate racery of a fine-leaved, sparse-grow- ng vine will heighten the value of he most classic architecture. The eauty of the human figure, or a tatute of the same, is much enhanced y the judicious use of delicate, ilmy drapery.

PLANTING ROADSIDE TREES

Written for California Cultivator
By J. H. Reed

A brief addendum to Mr. Braunton's nteresting and valuable article on Know the Trees," in your recent is- ue, the gist of which is "Plant Road- ide Trees."

It seems scarcely credible that this hole matter of systematic street ork reaches back but a dozen years. hen it was first proposed that it hould be a matter under municipal ontrol, the plan met little favor. Now n Southern California cities have ntire charge of their street beauti- cation and others are being added. Just at present this interest in ystematic tree planting is rapidly ex- nding to the public highways, where feel sure it will be as popular and apid in growth as it has been in our ities. One thing should be kept in ind, the lining of our good roads as ell as our city streets with trees is r the generations to come as well s for the present, hence it is exceed- ngly important that it should be roperly done. The most important em is the choice of varieties. They hould not only be adapted for the pur- ose, but such as are best suited to limatic and soil conditions. This everely limits the varieties that hould go on either city streets or ounty roadways. They should be ost carefully and intelligently stud- d before choice is made.

Just now some varieties are being rged, the suitableness of which at east is questionable. For instance he live oak is being favored by a few. t must be for sentiment's sake. Cer- ainly the oak we admire dotting the penings in many sections of Califor- ia is not the suitable tree to border ur roadways. Sentiment aside, it ould not be considered for a mo- ent. Nurserymen tell us it can be ade to grow as rapidly and shapely s other trees by proper care. Even this were true, we well know it ould not receive such care on the ublic highways.

The sycamore is favored by a few. n ravine roads or especially wet laces it would not be out of place, ut if there is anything more out of lace than the sycamore or any de- iduous tree for that matter, in this unland of ours, with their litter in he fall and nakedness during the onths when visitors from the ends f the arth come to see us, it would e a roadside lined with evergreen rees swaying in icy breezes over New ngland snow drifts.

Yes, the campaign for roadside ree planting is on. May it be pushed ith the same enthusiasm as the city treet planting, but let us go about t as though we realized we were plan- ing to make our loved Southern Cal- fornia the most beautiful spot in all his wide country for other genera- ions as well as ours. Let us be guided y careful, intelligent consideration, ot by impulse or sentiment.

Flowers should have a friable, very ertile soil in which to grow. They ften make a brave display in rather oor soil, but they appreciate good re.

KILLING DANDELIONS

Cut the dandelion roots off below the surface of the ground.

Gasoline or kerosene, applied at the crown of the dandelion, will kill individual plants.

When only a few stray plants appear persistently use the spud, or knife.

On badly infested lawns good results may be obtained by spraying with sulphate of iron.

Use one and one-half pounds of iron sulphate, which can be purchased at any drug store, to one gallon of water, remembering that it will discolor clothing and cement walks.

Apply the spray three days after lawn is cut, on a bright day when the possibilities of rain are slight.

The solution should be applied with a sprayer which gives a fine mist-like spray—a sprinkler is not satisfactory.

The lawn should be sprayed about once a month during the summer and not cut or watered for three days after the solution is applied.

Whatever method of eradication is used it is always well to reseed the lawn.

For reseeding eight or ten pounds of seed should be used on a lawn 100 by 150 feet. The seed should be sown broadcast, raked in, then watered daily for a time.

A good lawn grass mixture is 14 pounds of Kentucky bluegrass, two of white clover. Buy good clean seed and mix it yourself.

With the thickening of the grass and the use of fertilizer many of the dandelion plants will be crowded out.

Besides this reseeding it is well to scatter nitrate of soda over the lawn before a rain or just before the lawn is sprinkled. Fifty pounds will fertilize a lawn 100 by 150 feet.—W. L. Oswald, Assistant Agricultural Botanist, Minnesota University Farm.

I like to see flowers about a house and in the doorward. I do not remember to have ever seen an anarchist wearing a buttonhole bouquet or a very bad citizen whose house and yard contained flowers.

Harden off all plants before setting in the open ground. This is done by reducing the amount of water given and giving more air to the plant. It is simply a hardening of the tissues to withstand field conditions better.

Small Fruits Vegetables

CULTIVATION AND FERTILIZATION OF BLACKBERRIES

WHETHER an intercrop is grown or not, cultivation should be begun as soon as the plants are set in the spring and should be continued at intervals of from one to two weeks throughout the season. The purpose of this clean cultivation is to provide a dust mulch for the retention of moisture and to keep down suckers and weeds. Since the roots of the blackberry ordinarily lie close to the surface of the ground, cultivation must be shallow. The breaking of the roots not only weakens the root systems of the plants but increases the number of suckers. The deeper the soil and the more thorough its preparation before the plants are set, the deeper will be the position of the roots. Frequent cultivation is of greater importance during the growing and ripening season of the berries than at any other time, since more moisture is required then.

Fertilizers

The fruit, foliage and canes of the blackberry remove a large quantity of plant food from the ground each year. Most soils, however, have sufficient nitrogen, potash, and phosphoric acid to grow full crops of fruit for many years. Some are better supplied with one element than with others, and each grower must know his own soil before he can make profitable use of commercial fertilizers. Nitrogen should be used with caution after the berry field is in bearing, as it may cause a rapid cane and leaf growth at the expense of fruit bearing.

Stable manure is the best fertilizer to use, for in addition to supplying the elements of plant food it adds much humus to the soil. An annual application of 20 tons of stable manure to the acre will usually be sufficient, although there is little danger of using too much, especially after the field is in bearing. In order to supply humus, leguminous and other cover crops should either be plowed under before the plants are set, or grown between the rows of blackberries each year. When such crops are grown, less stable manure will be required—Farmer's Bulletin 643.

POTATO PRIZE

So important is it to the potato grower, the potato industry of the state and to all our people that we maintain a maximum yeild of potatoes of the best quality that a prize of $100 is offered for the best five acres of potatoes grown in California this Panama-Pacific International Exposition year of 1915. The money available for this prize is secured by one of our leading potato growers. Arrangements will be made for examination by an expert of the seed before planting of growing crops at least twice during the season and also to inspect and weigh or measure at time of digging. Careful data as to history of the soil, methods of planting, culture, irrigation, fertilization, care and management from first to last must be preserved and handed in at the close of the season. It is hoped and believed that this action will result in crops and will win prestige that will be far more valuable than will the prize. It is also hoped that we may secure other prizes of lesser amounts for second, third and possibly fourth prizes. It is also suggested to the county horticultural commissioners that efforts be made to secure prizes in their several counties for the best five acres of potatoes grown during this year.

All who engage to compete for a prize are asked to report to the writer at once and to name date when seed will be ready for inspection.—A. J. Cook, State Commissioner of Horticulture, Sacramento.

A FARMER'S GARDEN

Our garden is not as large as the average farm garden, being 31 by 67 feet in extent with a path three feet wide extending two-thirds the length. All rows run north and south. The soil is a heavy, dark, fertile but porous loam, and with deep tillage and thorough cultivation all available moisture is conserved.

In preparing the seed bed the soil was dug up as deep as the shovel would permit and well pulverized, thereby preventing the available plant food being locked up in the soil, also increasing the capacity of holding moisture. In spite of the long dry spell last season I could dig up moist earth.

The first work in the garden was in getting the cold frame in shape and planting a few varieties of seeds that were needful for early transplanting, consisting of tomatoes, peppers, lettuce for early use, also celery, cabbage and five or six varieties of annual blooming flowers.

The first sowing of lettuce, however, was a decided failure, and the seed bed was quickly prepared for the second seeding, and with a liberal application of commercial fertilizer and an occasional dose of liquid manure. This encouraged a rapid growth of crisp and tender lettuce, which was much appreciated. Owing to its superior quality, a few sturdy plants of this were transplanted for seed production for the coming season.

We had considerable space planted with peas, the dwarf for early, which furnished our table with delicious peas and lots of them, too, for the rows received plenty of fertilizer when they were planted. As the vines of the dwarf stopped bearing, the late peas were ready for use, giving us a long season. When they were through bearing the vines were pulled up to give the Giant Podded Limas, which we planted between the rows, full sway. They were also pulled up as soon as the beans were ripe and the ground was then prepared for a strawberry bed.

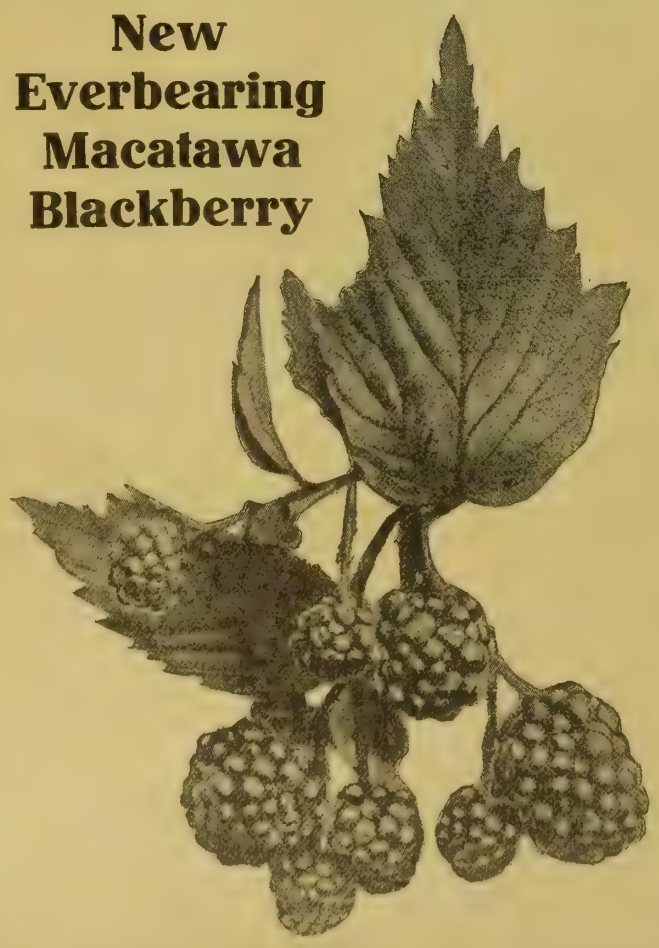
One of the most productive corners in the garden, and the one that actually proved itself the most satisfactory, was the tomato patch with its 50 plants all loaded down with large beautiful fruit, the Earliana for the early and a dark red variety, of which the name was lost, for late. In growing these tomatoes we trained them on stakes made especially for that purpose having four or five short wires fastened about 12 inches apart. As the plant grew up the wire, it was bent around the plant, holding it firmly until the next wire was reached. The plants were pruned to a single stem, insuring fruit of large size and fine quality. The yield was remarkable, as we had all the family could use on the table, canned 32 cans, sold one basket and gave some away.

We also had salsify, okra, cucumbers, parsley, onions, corn and about 75 or 80 heads of Danish Ball Head cabbage, and about 100 bundles of nice crisp and tender celery, which followed onions. A hailstorm stunted the cucumbers before they had borne many "cukes" and the vines were pulled up and the ground prepared and sown with turnips, which produced three bushels of nice large turnips as second crop. A variety of summer blossoming flowers were planted on either side of the path, using asters, candytuft, mignonette, zinnias, cosmos and gladiolus.

In cultivating the garden we used a scuffle hoe, a garden rake and a three-tooth hand cultivator, used in working between the narrow rows. No crust was allowed to form, as the soil was worked up after every rain.—Fruit Grower.

The best appreciation shies at language.

New Everbearing Macatawa Blackberry



Positively no orders accepted after April 15th.

To take advantage of this offer you must order at once.

Try this New Blackberry at Our Expense

Last Chance Offer

TO CULTIVATOR SUBSCRIBERS ONLY—To have this New Macatawa Everbearing Blackberry tested in as many localities as possible, claiming it to be the sweetest and best table berry on the Coast, the propagators of this berry have made us a proposition for supplying same in shipments of 6 plants each by parcel post, all charges paid.

Their description of the Macatawa is as follows: "It is a cross between the true Giant Himalaya and the Eldorado. The fruit is very large and sweet, in fact, it is the sweetest blackberry grown. It is coreless and almost seedless; very solid, jet black when ripe and can be shipped 1000 miles without bruising. The shape is oblong, very uniform, averaging three and one-half inches around one way by three and one-fourth inches the other way. The bloom is almost semi-double, about the size of a silver dollar. So far all who have tested this berry say it is the sweetest and best flavored berry they ever tried."

DO YOU WANT SIX OF THESE PLANTS? If so send in the regular subscription price for one year's subscription to the Cultivator, new or renewal; add 25c to cover cost to the nursery of postage and packing, and the six plants will be carefully packed and mailed you promptly without additional charge.

REMEMBER—The regular price of the 6 plants alone is $1.00 postpaid. Only one shipment will be made to a customer, but subscriptions and plants may be sent to different addresses.

Bees and Their Care

NATIONAL BEEKEEPERS' ASSOCIATION

IN The Beekeepers' Review we note that it will be continued as the official organ of the association. It was rumored that the association would drop entirely the financing of this publication. Regarding the national convention which was held in Denver we quote from the Review:

The annual meeting of the National Beekeepers' Association is a thing of the past. The new association that has sprung from the ashes of the old has thrown off its weaknesses and taken on the strength of a harmonious and united brotherhood.

The attendance of delegates was especially large and the attendance of Colorado and other western states was very satisfactory. The papers and discussions were of a high order and were enthusiastically received.

The business department of the association was satisfactorily arranged and will be conducted by an affiliated association, leaving the national free and untrammeled by business entanglements, to devote its energies to the educational and scientific labors so much to be desired.

The attendance was of strong men. Representation of this class was especially large. Some of the notables present were Dr. Phillips of Washington, D. C., Prof. Jager of Minnesota, Prof. Millen of Michigan, Frank Pellett of Iowa, E. I. Root, Editor of Gleanings in Bee Culture, C. P. Dadant, Editor of the American Bee Journal, and dozens of other strong men were in attendance and assisted in shaping the policies adopted.

The membership fee is fixed at $1.50 per annum, of which 50 cents is to go into the general fund, and $1.00 into the subscription fund. While the dues are fixed at $1.50 per annum it is not obligatory for any member to subscribe for the Review; he may instruct the secretary to devote the dollar to the promotion of lecture courses, etc.

It has now been two years since the national has had a cent of money in the treasury, from fees, and it is expected that its scope of usefulness will be greatly enlarged by the addition of dues.

The new organization (incorporated association) received the entire membership of the old national, consequently, each member of every affiliated association is now a member of the new association. The provisions governing the relations of affiliated associations to the national were changed slightly. It becomes necessary now for each individual of the state association to belong to the national before affiliation. This, however, does not affect the present status.

Some other minor changes were made in policy, but on the whole wise counsel prevailed. Some difference of opinion was manifested, but the entire proceedings were marked by earnest effort to clear the atmosphere of past differences and make it possible to exert the entire strength of the membership in solving the big things before us.

The officers elected for the ensuing year are as follows: President, Dr. Burton N. Gates, Amherst, Massachusetts, (re-elected); Vice President, Frank C. Pellett, Alantic, Iowa, (re-elected); Secretary-Treasurer, Wesley Foster, Boulder, Colorado.

The directors elected for two years are as follows: E. D. Townsend, North Star, Michigan, (re-elected); E. J. Baxter, Nauvoo, Illinois, and J. H. Stoneman, Blackfoot, Idaho.

INTELLIGENCE OF BEES

Gaston Bonnier, the great French authority, put pieces of sugar in his garden. The bees could not bite off any of it, but he marked the ones that tried. He watched them fly to their hive and later return with reinforcements, stopping on their way at a watering place, where they secured enough water to moisten the surface of the sugar. Other experiments have convinced him that bees making a "find" convey the intelligence to others and the number of bees then sent out is in proportion to the amount of treasures.

BEEKEEPING VS. SPRAYING IN BLOOM

The Massachusetts board of agriculture will shortly issue a poster indicating the proper time for spraying fruit trees and showing that while trees are in bloom, it is not only ineffective as a prevention against fruit pests, but also directly dangerous in some cases, being liable to spoil the blossoms and to cause the death of bees, thereby greatly reducing the amount of fruit set.

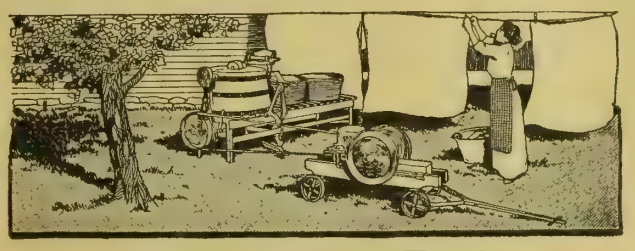
John Deere Implements



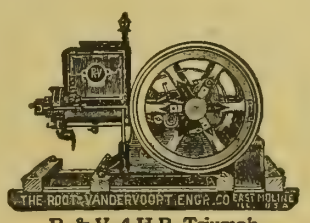
R. & V. Gasolene Engines

New Triumph One Horse Engine. Just the engine for light work about house and barn, such as running washing machine, pumping water and operating other small machines. Saves every member of the family work and worry.

A reliable, efficient, low priced but high grade engine. Easy to start, smooth running, requires no attention when in operation, economical in use of fuel and perfectly safe in and around buildings. All working parts are back of the fly wheel out of the way—a neat outfit in every respect.

R. & V. Triumph Engines for All Farm Machinery

The R. & V. Triumph line of engines is also made in 2, 4, 6, 8, 10, 12 and 16 H.P. sizes, stationary and portable. Every farm can use one or more of these engines to advantage.

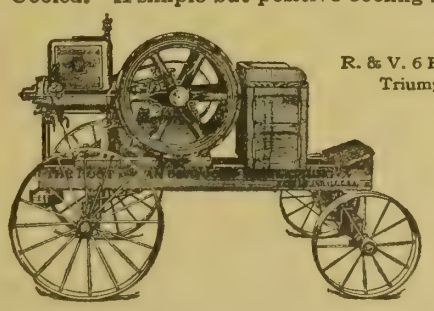


R. & V. 4 H.P. Triumph

They are dependable gasolene engines—always develop rated horse power.

An extra ring over the piston pin prevents scoring and ruining cylinder. This is an unusual precaution for lengthening the life of a gasolene engine. This careful attention to details is followed in constructing every part of the R. & V. Triumph.

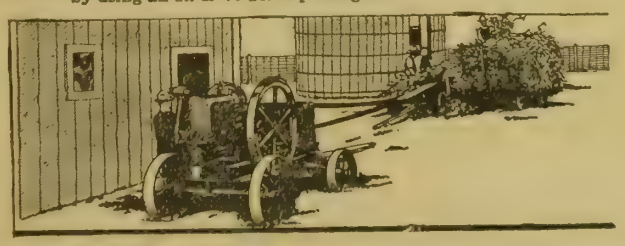
Hopper Cooled. A simple but positive cooling system.



R. & V. 6 H. P. Triumph

The gasolene tank for every R. & V. Triumph Engine is most conveniently and safely located—on practically all of the stationary engines it is in the sub-base.

Write for free booklet "Letting Gasolene Do It." This book tells how you can save time every day in the week by using an R. & V. Triumph Engine.



John Deere Wheel Plows

With Quick Detachable Shares

John Deere Wheel Plows, known the country over as "Quality Plows" are now fitted with John Deere Quick Detachable Shares—an exclusive John Deere feature.

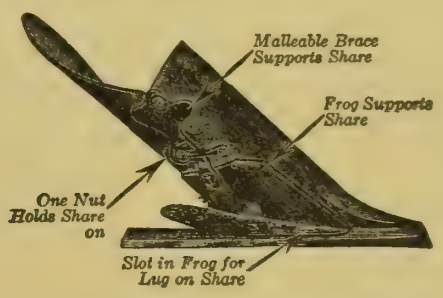
These shares are popular with farmers—they make hard work easy.

Superior Features

Unscrew One Nut—That's All

Unscrew one nut and the share comes off—slip share on, tighten the one nut and you are ready for work.

The share can be removed in thirty seconds and replaced in sixty seconds. Takes from eight minutes to half hour to change old style bolted shares.



Here's what John Deere Quick Detachable Shares mean to you:

1. No trouble to change shares.
2. Eighty per cent of time saved.
3. No danger of damaging share.
4. Share is drawn up closer.
5. Share is stronger—not weakened by bolt holes.
6. Resharpened or sprung shares can be drawn into place—no drift punch necessary.
7. No unequal strain on share.
8. No danger of injury to hands in taking share off.

We have beautifully illustrated booklets on the following plows with John Deere Quick Detachable Shares:

New Deere Sulky and Gang
(High Lift Frame Plows)

John Deere Stag Sulky and Gang
(Low Lift Frameless Plows)

John Deere Two-Way Sulky
(Side Hill or Irrigated Land)

John Deere Engine Gangs
(For Traction Engines)

Write for the booklet above that you want and we will send it to you free.

Better Farm Implements and How to Use Them

FREE BOOK Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, discs harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X-111.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

OLIVE DAY

Wednesday, March 31, is Olive Day. The department of agriculture and some state institutions of the East are calling attention to the wonderful value of cotton seed oil. It is time that more special attention was called to the superior quality of olive oil. The only point that has ever been made against olive oil is its cost, but its purity and ease of digestion are points which should be brought to the attention of the world, and one step in that direction is afforded by Olive Day. "Eat California Ripe Olives" is also a good slogan. There is no better nor purer food.

TORRENS LAW IN DANGER

Assembly Bill 655, now in the hands of the committee on banking, should be killed. It appears on the surface harmless, even helpful. It relates to the regulation of the business of banking and stipulates how savings and other banks may loan at low rate of interest on real estate. One of the requirements of making these loans, however, is that the title of the land must be shown to rest in the borrower by "a policy of title insurance or guaranteed certificate of title issued by a company authorized by law to issue policies of title insurance or guarantys of land title or by an abstract of title examined and approved by attorney for bank." The people of California voted favorably at the last election on the Torrens system of land titles, which would be of no use, at least where one wished to borrow money, if this law were passed. It is evident the intention of the bill is to nullify the action of the people of California. But few land holders would care to take certificate of title from the state if the law of the state makes it of no value when a loan is desired. Plainly there is a joker intended in this bill which should impel every well wisher of the state to get busy and prevent the interests from passing any such bill.

POULTRY FOR PROFIT

We trust we may be pardoned for again referring to that excellent book in the dollar series of the Cultivator Publishing Company, Poultry for Profit. The book is strictly true to name, and if its principles are followed it will surely lead to profitable poultry. At this time when many poultry people are discouraged at the outlook for high-priced feeds we imagine it a good time for the shrewd poultry man to enlarge the scope of his work, and one of the first steps in enlarging a business is to get a grasp of marketing conditions and learn wherein methods may be improved. Mrs. Koethen, the author of this book, is intensely practical, and the book is a chronicle of some of the practical methods she has used in her own successful business. Scarcely a mail goes out of Los Angeles these days without some copies of this book. The early order is the one sure to secure a copy. The publisher makes a proposition by which subscription to the Cultivator and Poultry for Profit may be had at a material reduction.

COMMITTEE AT WORK

At the meeting held in San Francisco, February 22, to consider the advisability of organizing a state agricultural society, one which would include all interests, whether organized at present or not, the chairman was instructed to appoint a committee of seven which should meet and formulate a constitution and by-laws or at least a line of action for the new society. Some of the most efficient men in the state were appealed to to work on this committee, which consists of: Prof. H. E. Van Norman, University Farm School, Davis; Dr. Herbert J. Webber, in charge of the Citrus Experiment Station at Riverside; C. Thorpe, secretary Walnut Growers' Exchange, Fay Building, Los Angeles; G. H. Hecke, Woodland, Horticultural Commissioner Yolo County; Charles A. Kimble, president California Wool Growers' Association, Hanford; Guy H. Miller, Modesto, president State Farmers' Union; George C. Roeding, Fresno, former president of the State Nurserymen's Association. Prof. Van Norman has been named chairman of this committee and he will call the members together in the near future.

INCREASE IN COOPERATION

With many farmers still groping in the dark for the best steps to take to market their fruit products, it is most satisfactory to notice how the raisin producers of the state are perfecting their organization by signing up more and more of the raisin acreage. All over the San Joaquin Valley new vineyards are being added to the Associated Company's holdings. New plants for handling fruit are being purchased or leased, and every promise is made for a successful year for the raisin producers. The cured fruit industry is likewise making a strong fight for more general cooperative marketing. Members of the California Fruit Growers' Exchange, for years the most perfectly organized of any of the industries, are casting about for some more perfect method of marketing. It seems to us that all these movements have promise for improvement in marketing conditions. The industry that refuses to cooperate refuses to succeed.

APPOINT A COMMISSION

The supervisors of San Francisco County have never felt that the fruit interests of that county called for the appointment of a horticultural commission. They have maintained that there is hardly a fruit grown in the county and the fact that the county is consuming vast quantities of fruit from practically every other county in the state has not appealed to them as a matter for their concern other than in a purely commercial way. State Horticultural Commissioner Cook has called the attention of the supervisors to the necessity of a commission to watch over the fruit interests of San Francisco County even if it is handling fruits only commercially. The industry must be protected if the interests of these handlers are to be protected; it is as vital to them as to the producer. This protection the taxpayers of San Francisco should be as willing to grant as are the taxpayers of the counties which produce fruit. If one large distributing center is permitted to pass through it infested fruit which will carry to other counties disease and lessened production, it will also suffer. We certainly hope the supervisors of San Francisco County will see this side of the controversy and grant the request of the state horticultural commissioner and observe not only the letter of the law, which says they shall appoint such commissioner, but its spirit.

FARM BUREAU DAY.

It was our pleasure to attend the annual meeting of the San Diego farm bureau last Saturday. The day has the making of a more interesting story than we have room for this week, but another week it will be touched upon more fully. San Diego was one of the first counties to establish a farm bureau and the first to have a farm adviser. Farm bureaus and farm advisers are two entirely different institutions. However, they have worked together to the wonderful advancement of agriculture in this state. The farm bureau is made up of locals or centers organized in various neighborhoods of the county, and these centers are working great good to the farmer. The farm bureau day is a day of gathering together and introducing those connected with these centers. It gives an idea of the magnitude of the movement, not only as to the one county, but brings to the attention of those who are attending many other bureaus in the same state and in other states. Instead of dozens affiliating, as in the locals, there are hundreds and thousands in county and state organizations, these all working to one end and, better, all putting themselves in position to aid other smaller organizations. Perhaps no question is more discussed during these days of lowering prices than that of marketing. Cooperation is progressing in all lines. How may it best work to the advantage of the producer? As yet there is no clean-cut answer, or at least none that is entirely satisfactory, though he is discussing it seriously and we believe with a possibility of arriving at a solution. Strength to the arm of the farm bureau and the farm adviser who works in conjunction with it.

Tolls received by the government for the passage of vessels through the Panama canal for the six months ended February 12, amounted to over $2,000,000.

Agricultural Notes

The International Viticultural Congress will be held in Convention Hall at the Panama-Pacific Exposition at San Francisco on July 12 and 13.

The American consul at Petrograd cables that shipments of lemons to Russia are now practical except via Saloniki, Roumania and Odessa.

Railroad passenger officials give out word that enormous Eastern travel is coming to the California expositions since the special reduced rates went into effect.

Owing to the hig price of flour in the canal zone the commissary department has reduced the size of the loaves of bread dispensed by it from 18 to 15½ ounces.

During the last week of February 14,850 bales of cotton, valued at $742,500, current prices, were loaded in Seattle for Vladivostok, Siberia. The cotton is destined for ports in Russia.

During the past few years much attention has been given by foreigners in China, as well as by many thoughtful Chinese, to the question of afforestation. The university of Nanking has established a school of forestry.

Minister of Agriculture Burrell of the Dominion of Canada and Territorial Secretary Thayer of Hawaii after visiting the Panama-California at San Diego are recommending to their governments that they make exhibits there.

Egypt expects to have an average crop of onions this year as both weather conditions and water supply have been favorable and there have been no war disturbances in the region devoted to the cultivation of this vegetable.

So far as known the silo which John Edwards of Englewood, Kansas, is building, will be the biggest in the world. It will be 50 feet across, 55 feet high and 15 feet in the ground. It is estimated that it will hold 2500 tons of ensilage. Edwards owns 10,000 head of cattle.

It is proposed to develop sugar beet culture in England. A factory is in contemplation at Gloucestershire. The estimated cost of the factory is $725,000 and it is proposed that the government be petitioned to guarantee the stock, the preference shares being taken up by the landowners and citizens and the ordinary shares by the farmers. After paying five per cent interest, the profits are to be divided among the holders of ordinary shares in proportion to the quantity of the roots delivered.

Wheat growing states will not experience any difficulty in harvesting their big crop this year, if plans just launched by the National Farm Labor Exchange of Omaha are successful. The board of directors consists of the state employment departments and state agricultural boards of Missouri, Kansas, Minnesota, Iowa, Nebraska, Oklahoma, Texas, North Dakota, South Dakota, Wyoming, Colorado and Montana. It is planned to extend the work to every state in the Union. The United States department of agriculture and the industrial relations commission will cooperate in the work. Emergency workers will be signed up at once and they will be thrown into the Texas fields where the grain begins to ripen early in June. As ripening progresses northward the laborers will be moved, reaching North Dakota and Minnesota late in August. Kansas City, Sioux City and Minneapolis will be clearing houses for the farmers and the laborers.

Agricultural News Notes of the Pacific Coast

Northern California

Total membership of the Solano County farm bureau is 150.

The planting of almonds has been greatly extended in Sutter County.

Four cars of rice were recently shipped from Chico, Butte County.

Lodi, San Joaquin County, is planning to ship more strawberries than any preceding year.

Tehama County sheepmen report large losses of spring lambs because of the continuous rains.

Several Northern California towns are engaged in beautifying vacant lots and generally cleaning up roadsides.

Contra Costa County poultrymen will incorporate for the purpose of handling products and securing supplies for members.

The cannery at Lincoln, Placer County, put up 18,000 cans of fruit in the season of 1914. This was during a 40-day run.

Los Molinos, Tehama County, has a new dairy of pure bred Jersey cattle. Stock for the ranch was bought at an average of $150 per head.

The Cow Testing Association at Gridley, Butte County, is proving its worth by aiding the dairymen in eliminating non-productive cows.

Many poultrymen of the state attended a session of the assembly at Sacramento to listen to discussion of anti-Chinese egg legislation.

The proposal to form a cow testing association at Chico, Butte County, met with objection because some felt that it would be for the benefit of the few.

Through the activity of the Yolo County farm bureau it is expected that a county swine raisers' association will be formed to fight against cholera.

The Plant Introduction Garden at Chico had placed many plants in cold storage to keep them dormant until the planting season of the East is over, when they will be distributed.

The dehydrated olive has met a favorable reception in Tehama County where it is being processed in an evaporating machine. The olives are allowed to fully mature on the tree before processing.

Stock are now allowed to be shipped into this state on permit from the state veterinarian. Stock for immediate killing may be freely brought in from Nevada, Oregon, Utah, Arizona, New Mexico and Texas.

Fruit shippers who had hoped for reduced freight rates because of the building of the Panama Canal are disappointed by announcement by the railroads that there will be no change during the coming summer.

Governor Johnson has announced appointment of the three members of the water commission established by act of legislature in 1913. They are: Irving Martin, newspaper editor, of Stockton; A. E. Chandler of Berkeley, irrigation engineer and lecturer at the university of California, and W. A. Johnstone of San Dimas, Los Angeles County, former assemblyman and author of the water commission bill.

Central California

Hollister, San Benito County, shipped 28 cars of hay in one day last week.

Kings County raisin growers are signing up contracts with the Associated.

W. J. Mowry has been re-elected president of the Kerman Cured Fruit Association.

The University of California reports 395 taking the new correspondence course in olives.

The San Joaquin Sugar Company at Visalia is urging farmers about Merced to plant sugar beets.

Hog raisers at Tulare report poisoning of hogs resulting from eating seeds dropping from umbrella trees.

It is rumored that outside packers are cutting prices on raisins in order to discourage members of the Associated.

There was a general meeting of the members of the Tulare County Citrus Protective Association at Lindsay last Saturday.

The raising of race horses has been made a profitable industry by a rancher in the Cuyama Valley near Maricopa, Kern County.

The King bill regulating shipment of green oranges and frosted citrus fruits has been amended to conform to the proposed federal law.

The Porterville Alfalfa Company recently shipped a car of fat stock to San Francisco. By now only about 400 steers are left on the ranch.

There are about 1500 acres of raisins not in the Associated in the section of Dinuba, Tulare County. An effort is being made to sign up the entire amount.

Tulare County Pomona Grange met recently at Visalia and installed officers for the coming year. J. W. McPherson of Orosi is master, Mrs. B. C. Anderson of Visalia, secretary.

Swine raisers recently met at Lemoore, Kings County, and organized the Kings County Hog Breeders' Association. The principal work of the association will be eradication of hog cholera.

Estimates indicate that Kings County's output of fruit this year will be 25 per cent larger than last year, due largely to plantings of new orchards. The county estimates that it will receive $2,500,000 for the crop.

At a farmers' meeting held in Tehachapi recently, under direction of Agricultural Demonstrator Roberts of the Santa Fe Railway, Dean Thomas F. Hunt of the University of California spoke to the farmers on pear blight. Other speakers were: S. W. Foster, R. R. Mack, Kern County farm adviser, and Kent Knowlton, horticultural commissioner of Kern County.

The Associated Raisin Company has bought out three more raisin packing companies. Rumor has it that a fourth will soon be added. The Associated now has control of eight packing houses as follows: Fresno Home Packing Company, Kings County Raisin and Dried Fruit Association, Mowat & Company, Clovis Farmers' Union, Oleander Farmers' Union, Giffen-Hobbs Company, Malaga Packing Company and the Fowler Fruit Company.

Southern California

Paso Robles in San Luis Obispo County is planting extensively of blackeye beans.

The Ventura County Fair Association directors are arranging details for the 1915 fair.

The Sugar Beet Growers' and Manufacturers' Educational Association met recently in Los Angeles.

Covina, Los Angeles County, is shipping quite extensively of winter rhubard to Eastern markets.

San Luis Obispo County is discussing advisability of calling a good roads bond election for a million dollars.

The Santa Ana Valley Walnut Growers' Association is contemplating the building of a new packing house at Anaheim.

The San Diego Floral Society held a three-day exhibit on the Panama-California Exposition grounds March 19, 20, 21.

The Poultrymen's Association of Southern California has arranged with a Los Angeles firm to handle its entire product.

The Hemet Farmers' Club will meet March 25. Prof. H. J. Quayle of the pathological laboratory will be present to answer questions.

The Tri-counties Reforestation Committee has appointed a committee to look after all legislation affecting drainage or irrigation.

County Horticultural Commissioner Beers reports fumigating and spraying against fruit pests more general than any preceding year.

The local center of the San Diego County farm bureau at San Luis Rey listened to an address at its last meeting by Adviser Weinland.

The Indians of the Pala reservation in San Diego County are planting orchards and generally getting their reservation into productive condition.

The Ventura Avenue farm bureau center has endorsed the county free library plan and will ask the supervisors to establish a branch in their section.

Cantaloupe shippers of the Imperial Valley are endeavoring to perfect a more effective association. It has been claimed by some that shippers and jobbers last year lost heavily.

An immense force of men is working on straightening the levees along the Colorado River. This work is being mostly done over the line in Mexico. It is expected the levees will be sufficiently strengthened before the high waters of June.

The recent meeting of dairymen in Los Angeles resulted in the appointment of a committee which will investigate as to the advisability of a large cooperative marketing association which will deliver dairy products to the consumers in the city.

Orange labels have been sent to this state by Californians who were visiting in Japan and who purchased, supposing they were getting California fruit. The labels are declared counterfeits, and the inference is that they are being used on Japanese fruit in order to induce more general sale.

The Coast

Wool growers of Utah are selling at 22½ cents.

Arizona is organizing poultry clubs for boys and girls.

Shearing, which began in Arizona in February, still continues.

Chehalis County, Washington, has just installed a farm adviser.

Nevada wool growers are reported holding out for 25 cents a pound.

The third annual Southern Arizona fair is being held at Tucson this week.

Farmers at Redmond, Oregon, are doing extensive plowing for spring crops.

The March meeting of the Arizona Poultry Association was held last Saturday at Phoenix.

Stockmen of Southern Arizona are pleased at the heavy feed which covers nearly all ranges.

The sale of 2500 head of young cattle was made in New Mexico last week at $32.50 per head.

The Utah County Fruit Growers' Association met recently at Provo and agreed upon a pooling system for the coming year.

Roosevelt Lake in the Salt River Valley, Arizona, passed the 1,000,000 acre-foot mark last week and an elevation of 201 feet.

Contracts have been made at Puntenney, Yavapai Country, Arizona, for yearling steers, June delivery, $35; two-year-olds, $45.

The Wenaha forest reserve near Walla Walla, Washington, will have grazing for 11,000 horses and cattle during the coming summer.

Eastern Washington Jersey breeders have organized the Inland Empire Jersey Breeders' Association. W. T. Newbury of Mica is secretary.

Southern Arizona is planting quite extensively of early apricots. During this season the trees have cost the fruit growers about $25 per hundred.

The reduction of the stock of early winter apples is resulting in better prices being secured by producers of the Northwest for good keeping varieties.

The Commercial Club of North Yakima, Washington, has raised a $5,000 fund as guarantee for a stock show. The amount is to be raised to $15,000 if possible.

The Oregon Horse Breeders' Association recently organized at Corvallis, electing John Wells of Alicel, president and Carl N. Kennedy of Corvallis, secretary.

Farm Adviser Armstrong of Maricopa County, Arizona, announces that work which he is directing from Phoenix is progressing well and several meetings are being planned.

Live Stock breeders of Cochise County, Arizona, met at Willcox and elected officers for their new association for the coming year. J. T. Wood of Willcox is the secretary.

Farmers of Eastern Washington have taken for their slogan, "Let us organize into a mighty brigade that will sweep our community and state for the cause of live stock improvement." Community associations are being organized at various points.

On Their Feet Again

KOW-KURE

HUNDREDS of farmers and dairymen have felt the joy of seeing sick and ailing cows restored to health and productiveness by the use of KOW-KURE, the great cow medicine. This wonderful remedy has proved its worth for over twenty years in the prevention and treatment of ailments which sap the life and strength of dairy cows—such as Abortion, Retained Afterbirth, Barrenness, Milk Fever, Scouring and Lost Appetite.

Many backward cows are overfed with so-called stock foods when what they really need is a medicine that will tone up the system and repair the sluggish digestive and genital organs. HEALTHY cows will thrive on nature's food and produce more and better milk.

If you have a cow that is below par, go to your druggist or feed dealer and try a package of KOW-KURE; the result will surprise you. *Sold in 50c and $1.00 packages.*

Write today for free treatise, "The Cow Doctor."

BUTTER SCORING CONTEST

THIRTY-ONE buttermakers participated in the first scoring of the 1915 educational butter scoring contest which was held March 11, 1915, at the university farm, Davis.. Of this number nine had not taken part in any previous contest, while the remaining 22 had at sometime in the past participated. Several of the contestants are now started on what is their third year, one is starting on his fifth year, while another has taken some part every year since the contests began in 1909. The butter sent to this scoring was of fair quality with an average of 91.68 for all entries, 25 per cent of the entries scoring 93 or above, 53 per cent scoring 92 or above, 78 per cent scoring 91 or above and 90 per cent scoring 90 and above. The entries were due at the university farm March 8, and were held in the refrigerator room until March 11, when they were scored by Mr. T. J. Harris, official inspector of the San Francisco Wholesale Dairy Produce Exchange, L. M. Davis and H. S. Baird of the dairy division.

Following are the scores with the exception of those who do not wish their scores published:

B. Bertholsen, Los Angeles Creamery Co., Hanford, 92.

P. Bernasconi, Harmony Valley Creamery, Cayucos, 92.

John Clausen, Riverdale Cooperative Creamery, Riverdale, 90.

Glenn Decow, Mission Creamery, Perris, 93½.

R. B. Foss, Imperial Valley Creamery, El Centro, 91½.

W. J. Grinnell, Libby, McNeill & Libby, Loleta, 91.

Geo. Hartson, Fountain City Creamery, Merced, 91.

Ed. Hooper, Spreckels Market Creamery, San Francisco, 92½.

J. N. Jensen, Visalia Cooperative Creamery, Visalia, 92.

David P. Johnson, Riverside Dairy Co., Riverside, 92.

Simon Koppes, Montague Creamery, Montague, 91½.

A. Kristensen, Santa Ynez Valley Creamery, Solvang, 90½.

L. Larsen, Sunset Creamery, Loleta, 93.

Lee, Star Creamery, Holtville, 90½.

W. W. Leffingwell, Stonyford Creamery, Stonyford, 93½.

A. Le Roy, Exeter Creamery, Exeter, 93.

N. C. Nelson, Crescent Creamery, Reno, Nevada, 93½.

Richard Nelson, Pt. Reyes Cooperative Creamery, Pt. Reyes, California, 92½.

Wm. Oelkers, Minden Butter Manufacturing Co., Minden, Nevada, 93.

Edw. O'Mara, Heber Cooperative Creamery, Heber, California, 91½.

P. Peterson, Valley Flower Cooperative Creamery, Ferndale, 92½.

J. C. Phillips, Delta Creamery, Imperial, 92½.

G. G. Plunkett, Visalia Creamery, Visalia, 91.

———, Gridley Creamery, Gridley, 92.

W. T. Scheld, Inyo Cooperative Creamery, Bishop, 91.

H. Sutton, University Farm Creamery, Davis, 91½.

G. W. Wright, Woodland Creamery, Woodland, 93.

Feed Flavor Appears

The most frequent criticism made under flavor was a feed flavor. Over one-third of the entries showed the effect of feed conditions which exist in nearly all sections just at present. The common alfalfa flavor was noticeably present in a number of the cubes. This is not a flavor which can be classed with a dirty flavor, but regardless of the fact that it is not an unclean flavor, it is objectionable and is one which handicaps the marketing of the butter by the butter dealers. Overcoming this flavor is one of the problems of the buttermaker, for as conditions are in California he can but expect alfalfa to form the greater part of the ration of the majority of dairy cows. Methods in the creamery which will work to that end are pasteurization and the liberal use of good starter. More creameries are realizing the importance of those methods, as the method blanks show that 61 per cent of the entries were made from cream which was pasteurized and to which starter was added, nine per cent were made from cream which was pasteurized but in which no starter was used, while 22 per cent were made from unpasteurized cream with the use of starter. It must not be thought that these methods will insure the highest grade of butter, for the condition of the raw material is the real seat of the trouble, but it is certain that they are steps in the direction of improving the quality of butter. Aside from the food flavor there were some of the common defective flavors which are typical of much of our butter. Foreign flavors of any kind are in the majority of cases due to a lack of care in producing the milk and cream. Many of the defective flavors found in butter are caused by some form of dirt. One of the most essential factors in the successful handling of any dairy product is cleanliness. Another is low holding temperatures. Considering these, and our natural climatic conditions as well as the fact that cream is such a perishable article, it is plain

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. ☞Send for descriptive circulars, testimonials, etc. Address

The Lawrence-Williams Co., Cleveland, O.

Economy Calves

You can now feed a calf for the first five months of his life for less than half the cost of the milk he would consume in the old way. Do this with

Blatchford's Calf Meal

This meal has been known as the complete milk substitute since the year 1800. Very easily prepared. It prevents scouring promotes a strong rapid growth and makes a better cow.

Write for Actual Figures based on results, that show you how to increase your calf profits. The new data will be sent for the asking. Write today.

the California butter will not be of best quality until each person concerned in its production assumes his full degree of responsibility. The condition of the butter markets just at present demands that butter must show quality if it is to be sold at highest profits. Overstocking the market with medium or low grade goods will not help the situation. Low quality has a depressing effect on the local and domestic markets and is a serious handicap in developing export trade. It is a losing proposition for every one in the dairy business.

Defects Due to Methods

Mechanical defects of one kind or another were present in many of the entries. Greasy body was the most common, caused mostly it would seem from the use of too high temperatures, either for churning or washing, or excessive working. Uneven color was found in 13 cubes to such an extent as to call for cuts. In working butter it is the aim of the buttermaker to strive for good body and texture, distributing the salt and getting the color uniform. In cases where certain of the conditions are not right it is not possible to do all of these things, and one is accomplished at the expense of another. Some buttermakers work their butter sufficiently to make the color uniform, but in order to do this the working is excessive from the standpoint of body and texture. The incorporation of moisture is another factor that influences the condition of the body, and frequently a buttermaker will manipulate the temperatures and manner of working in such a way that he gets the desired percentage of moisture incorporated, but the butter will be found to possess numerous mechanical defects. It is the strict regulation of these points which determines a buttermaker's ability. Light color was a criticism made of two entries. An exceedingly high color was found in another cube. Uniformity is a desirable thing in marketing. Other mechanical defects noted were gummy body, leaky body, high salt and grittiness. Some of the troubles under flavor may be justly charged to the producers of cream, but the buttermaker himself is the one who must assume the blame for mechanical defects.

Five Entries to Follow

In announcing the 1915 contest it was desired to reach every buttermaker so that all who wished could take part. If any were missed they may still enter and win a certificate, as the rules provide for a Grade B certificate for those buttermakers who take part in five entries only and who obtain an average score not below 93. Information and blanks regarding the next entry may be obtained by addressing Division of Dairy Industry, University Farm, Davis, California.

MILO AND KAFIR HARD ON SOIL

Do milo or other sorghums "poison" soils? There is an opinion prevalent in some sections that there is a poisonous acid or other substance freed in the soil by the roots of these plants. Others think that the effect is more or less mechanical and comes from not plowing under the roots deeply. As there are thousands of acres of these crops grown in the Imperial Valley where barley often follows milo we have written to Mr. W. E. Packard, in charge of the Imperial Valley experiment station near El Centro, who writes:

"We are growing some barley on old milo land (the land has been in milo for two years), and so far can see no effect whatever. The stubble was plowed under and not simply disked, as many do. I have seen fields in the valley where the poor stand of barley was attributed to previous crops of milo but have no proof that the milo had any effect. I do know that good barley has been grown on old milo land again and again with no ill effects. I would certainly recommend plowing before planting the barley, however, as the simple mechanical effect of the roots where not plowed under might have a bad effect."

Regarding best sorghums to raise for grain, and certain objections which have been raised to Egyptian corn, Mr. Packard advises:

"Egyptian corn has not proved a good grain for this section solely on account of the fact that the grain shells out too easily. The birds get a large part of the crop in many cases, and much more is lost in gathering and hauling. The Egyptian corn yields well here and the heads are large and heavy. A ton to a ton and a half is a normal yield where the grain is not eaten or lost by shattering. I believe that it does not produce as much fodder as milo, at least that is our experience. The fodder is valuable as food after the grain is ripe but should of course be used simply as a roughage."

A FINE PRODUCER

California dairymen have shown much enterprise in bringing in some of the best blood to be found in the world, and we are proud of some magnificent stock which has been brought here. California dairymen are also producers of some fine strains. We believe some of the finest work done in California has been by Mr. Guy H. Miller, owner of the Venadera herd. This herd has won many "blues," "champions" and "grand champions" at the state fairs, and everyone of these winners has been a home-made product. Mr. Miller believes in introducing new blood when necessary, but his best stock has been of his own production.

In a personal letter Mr. Miller refers to one of his latest favorites as follows: "We have a heifer, Jewel of Venadera, that has recently finished an official yearly test which is a new record for California Jerseys beginning under three years of age. For the 12 months she gave 8017 pounds of milk, making 441 pounds of fat, 519 pounds of butter 85 per cent fat. Jewel began the test at 23 months of age. She was fed and milked but twice daily throughout the test and ran with the rest of the herd in good weather and bad the year round. She was, of course, bred in Venadera herd, and her sire and dam were also. As a purely Venadera product we are well pleased with her for she is a handsome individual as well as being a great worker."

DEHORNING CALVES

We have several requests for information as to the use of caustic for preventing growth of horns in young calves. We copy the following from "Diseases of Cattle," issued by the department of agriculture:

"The operation is performed as follows, and is uniformly successful if performed before the calf is three days old: The little animal is caught and gently laid over on its side, in which position it is easiy held by one assistant while the operator clips the hair off the trifling prominence on the frontal bone which marks the spot on the uppermost side of the head where the horn would be developed if not interfered with. He then takes his stick of potash, dips it in cold water, and carefully rubs it over the part just clipped for the space of, say, ten seconds. The calf is now turned over, the corresponding portion of the frontal bone on the other side clipped an thoroughly rubbed with the moistened potash the same way as the first. By this time the side first treated is dry and ready for a second application of the caustic, which should conform exactly to the first. Follow the same procedure on the remaining side, where the matrix of the embryo horn has been located, and, if the caustic has been properly applied, no horns will ever make their appearance."

THE BLUE BOOK

The sales of the 25th volume of the Blue Book of the National Holstein-Friesian Association now average about 50 copies per week, and at that rate it is evident that a large number of copies will remain unsold at the close of the fiscal year. Should this be the case, the number of copies of the 26th volume to be printed will be correspondingly reduced, and may fall far below the demand. Five thousand copies each of the 24th and 25th volumes were printed and about 4,600 copies of the 24th volume have been sold with only one-half that number of the 25th. Fully 2,300 breeders who have the 24th volume have not applied for the 25th; yet each breeder will need to keep his set complete, as no further volumes can be printed as complete as was the 24th. The 25th volume refers frequently to the 24th, and the 26th will refer to both the 24th and 25th volumes.

The survival of the fittest

TRIED in the furnace of competition and subjected to the test of years of practical use on nearly 2,000,000 farms the world over, the De Laval has proved its overwhelming superiority to all other cream separators.

Twenty years ago there were as many makes of factory as of farm separators, but for the past ten years the De Laval has had this field almost to itself, 98 per cent of the cream separators in use by creamerymen and market milk dealers to-day being of the De Laval make.

It has taken the inexperienced farmer a little longer to sort the true from the untrue, the wheat from the chaff, in the maze of conflictory catalog and local dealer separator claims, but year by year the ever-increasing proportion of farm separator buyers is reaching the same conclusion as the creameryman—that the De Laval is the only cream separator they can afford to buy or use.

Many other cream separators have come into the limelight of publicity for a few short months or a few short years, claiming to be "as good as" or "cheaper" than the De Laval, but their users have sooner or later found them lacking in some one respect or another, and even where a few have seemingly done well their users have come to learn that the De Laval was a still better machine.

The unfit or the less fit cannot possibly survive for long in separators or anything else. Think of all the separators you used to see advertised so extravagantly in your favorite farm papers. Where are they now? Why do you seldom, if at all, see their names mentioned? Simply because the fittest must survive and the others must fall out of the race.

The De Laval has triumphed over all other separators, and its supremacy is now almost as firmly established in farm as in factory separators because its separating system, design and construction are essentially different from and superior to other separators.

A De Laval catalog to be had for the asking explains and illustrates these differences. A De Laval machine, to be had on test or trial from the nearest local De Laval agent, does so better still. If you don't know the nearest local agent, simply write the nearest De Laval main office as below.

Alfalfa Seed

Every field where Seed we offer for sale was grown in 1914 was thoroughly inspected by us for dodder, noxious weeds, etc., before it was harvested.
Everything we offer has been government tested to make our assurance doubly sure, both as to germination and foul weeds.
We are actually offering California's best product.
If you are looking for cheap, unreliable stuff, you will have to look elsewhere, but if you want good seed at an honest price we can serve you.
Samples, prices, etc., on application.

V. A. Peterson Alfalfa Seed Co., Arbuckle, Cal.

The only exclusive Alfalfa Seed Dealers in the West.

SUDAN GRABS CROP ON A LUBBOCK COUNTY FARM.

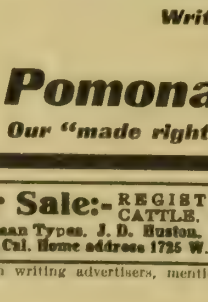
¶ BE SURE IT'S PURE. That's the one thing absolutely necessary about SUDAN GRASS SEED. Don't let considerations of saving a few dollars on the price now keep you from buying seed that you can feel sure is genuine and unadulterated. If you do, you'll pay double penalty in a poor harvest and sow your land with the plague of Johnson grass.

¶ LUBBOCK ASSOCIATION GUARANTEED SEED is sold with the following warranty as a part of our contract:

"WARRANTY: The Lubbock "Sudan Grass Seed Association of "Lubbock, Texas, warrants that the "Sudan Seed it will deliver under "this contract was grown during the "year 1914, in Lubbock County, "Texas, by a member or members "of the Association; that the fields "in which said seed were grown, "and the growing crops, were in- "spected and passed upon by a "Committee sent out for that pur- "pose by the Association, headed "by Victor L. Cory, Superintendent "of Texas Agricultural Experiment "Substation No. 8; that every pre- "caution to insure purity of seed "known to said Committee was taken "and enforced, and that the name of "the grower or growers of said seed "shall appear on or be attached to "each and every bag of seed. The "Lubbock Sudan Grass Seed Asso- "ciation further warrants that the "Sudan Seed it will deliver under "this order is absolutely pure Sudan "Grass Seed, free from Johnson "grass or any other seed, and of "strictly superior quality."

¶ That's your warranty for a good Sudan Grass crop — and the unimpaired value of your lands. Our price is absolutely in line with what you get from us — pure and guaranteed seed of unquestioned germinating power.

¶ BUY NOW. Don't wait until all the Pure Seed is sold and you must pay higher prices for inferior grades.



Put up in 1-2-5-10-25-50 and 100-lb. packages.

Sore Feet in Pigs

What is wrong with my pigs? On February 15 I put them on alfalfa. About three weeks ago I noticed their noses were very red, then they turned yellow and large pieces of skin peeled off. Soon after I noticed their hoofs were red and sore and the cushions under the hoofs badly swollen so that they walked apparently on the first joint instead of the point of the hoof. Their appetite has been fine.—Subscriber, Glendale, Arizona.

Because you say "their appetite has been fine" and that they are improving it can not be foot and mouth disease and is not so very serious. There must be something in the soil that is irritating the feet and nose. Oil the parts well with engine oil or cosmaline.

Breeding Question

Are there any symptoms by which one can tell if a cow is in calf? Does the udder become caked? The cow was bred about two months ago.—Subscriber, Arizona.

There is no way whatever to tell that a cow is with calf so soon after breeding except that the cow ceases to come in heat and refuses the bull. It would not affect the udder. Read the article on garget in the Cultivator of March 18.

Skin Disease

Please let me know what is good for a Jersey cow that has pimples on her neck and sides that irritate her so she rubs herself and causes large patches to become raw. The veterinarian advised me to use mercurial soap but the pimples came as before. —Subscriber, Merced.

It is difficult to say just what is causing the irritation of the skin. Try bathing the parts with a five per cent solution of zenoleum or some other good sheep dip. To remedy the condition of the blood that may be the cause of the trouble give first a physic of one pound of epsom salts and half a pound of common salt dissolved in two quarts of hot water and given as a drench at one dose. Then get one pint of Fowler's solution of arsenic and give one ounce of the solution once a day on some feed.

Scratches

What is the best thing to do for scratches? I have a horse that has a breaking out of pimples that discharge matter. I have been told that it is scratches. It is only at the hock joint. —Subscriber, San Dimas.

Give internally a small tablespoon of nitrate of potash once a day for two weeks by putting it in the feed or water. Also get of your druggist two drams of chloride of zinc in one quart of water. Warm it in an earthen or granite dish and apply it to the chapped skin once a day while warm.

Dry Skin

I have a number of pigs several months old and in marking their ears I find that there is no blood in them whatever. Their ears are hard and stiff and are just like leather. They also seem to be a little sore under their legs which causes them to walk a little stiff. Would like to know the cause and the remedy for the trouble.—Subscriber, Berendo.

Oil them a few times all over with a light grade of engine oil.

Retaining Afterbirth

I am having some trouble with my cows retaining the afterbirth. What is the cause and what is the remedy? —Subscriber, El Centro.

The cause is a lack of something in the system from a lack of something in the feed. A handful of ground flaxseed in the feed once a day for two or three weeks before calving or a quart of raw linseed oil given at the time of calving would probably regulate the trouble. If the afterbirth is retained over 24 hours after calving it should be removed carefully with the hands and the womb washed out with a two per cent solution of zenoleum at the temperature of the body.

Physic for a Horse

Please give a receipt for a physic for a horse in case of impaction and directions for giving it.—Subscriber, Watsonville.

The following is a good physic for a horse: Take powdered barbadoes aloes one ounce, powdered nux vomica two drams, powdered belladonna leaves four drams and raw linseed oil one pint. Shake well and give at one dose as a drench.

SANITATION

IS THE RELIABLE METHOD FOR PREVENTING

FOOT AND MOUTH DISEASE

Economics on the Farm

SOCIAL LIFE IN THE COUNTRY

By Mrs. Robert Potter Hill Before State Fruit Growers' Convention

AN organization whose educational mission is " * * * to so equip the farmer as to enable him to keep himself and his industry from lagging behind in this great age of industrial, domestic, moral and social progress, among whose objects is to develop a better and higher manhood and womanhood among themselves. To enhance the comforts and attractions of their homes, and strengthen their attachments to their pursuits."

From this you will readily see that the highest mission of the grange is to exalt and uphold a high ideal of farm home life. And to help realize this ideal, on every hand, the grange discusses what a home in the country really affords and what it stands for in the lives of the family. Again and again in grange programs, under one head or another, is drawn out the fact that good farming which understands its soils and its crops underlies all ideal country life whether it be on a large or a small scale.

Follow this with the thought that the spirit of homehelpfulness, industry and play combined must be built on a good farm foundation, and then that reaching out into the community must stimulate the building of better roads, better schools and better churches, which with their attendant social activities are necessary for the ideal country life.

My message is "The Need of Rural Child Welfare, or Social Work, in its Relation to Horticulture."

For if you are to have lasting results for all the scientific thought that you are giving to the cultivation and culture of your fruits and various crops, you must give the same scientific thought and attention to the keeping of your boys and girls on the farm.

You are familiar with the great movement of population from rural districts to cities. You know also that most of our successful men and women come from the rural districts, and a fundamental fact is that from rural districts comes all of our food. That the country can continue indefinitely to send the best boys and girls to the city and keep up the quality of the supply is hardly to be expected.

What the rural population needs to insure its stability are first increased production (there are nations in Europe with soil inferior to ours that produce two to two and one-half times as much per acre as we do); secondly, increased profits through cooperative buying and marketing; and third, and for which I make my plea, better social institutions, churches, schools and social centers. I would have you foster every opportunity for wholesome recreation in your community.

Until recent years the study of social questions and the application of modern methods of philanthropy have been confined almost entirely to city life problems. The welfare workers of America are just beginning to see that all matters of social and family uplift, relate as truly to the rural as to the urban classes. One reason for the farmer's neglect of rural welfare work is the greatness, combined with the vagueness, of the task—even now it seems like a great mountain outlined in the mist. I will only speak for more and a better social life.

We need to remember that pleasure-seeking is a natural instinct in all young people. By young people, I mean the normal child of that mysterious age between twelve and eighteen when the boys and girls have ceased to be interested in the daily rounds of washing dishes, mending, milking, going to school, finding bird nests and being happy with other outdoor things.

California gave to its city and country people one great foundation to help toward a wholesome social life—when it gave the use of its schools to the people who built them. Take advantage of this and socialize your schools, your churches, your Granges—your neighborhoods, and provide suitable centers under the leadership of the Grange, or, if you are not fortunate enough to have a Grange in your neighborhood, then under farm leadership. Take the social life away from the town or small city unless they provide a suitable social center. This wonderful social center idea must be fitted in some way into the meager lives of rural young people. In some way boards of education and school trustees must be aroused; granges and neighborhoods must be aroused and in some way the rural church (the ideal leader), must be aroused and awakened so as to become a prime agency in this regeneration of social country life. I hesitate, but I must put this added responsibility on those who are so poorly paid and sometimes not paid, leaders of country churches. It is for the country church first to advocate social reforms, originate social improvements and stimulate the "service of humanity as the earthward side of the service of God." "The church of the country must not be satisfied with a gospel of personal salvation but must be filled with the passion of vitalizing the life of the entire countryside with ideals that do justice to our social Christianty."

Rev. Deiman of Chicago recently said, "The church must so energize rural life that it may keep pace with our advancing civilization." Dr. Gill and Mr. Gifford Pinchot are the joint authors of a new book called the "Country Church." I can quote but one or two of its most pregnant statements, "The church is the natural body to lead in rural social service." "The country church needs rural social service as much as rural social service needs the church." "Social service is as important to the health and life of the country as it is to the city."

If I am to leave a thought in your minds, as Grangers, as friends, as colaborers in the fruit and farm industries of this great state, it is this, that while you are planning, thinking and working to make class A farms, remember the scientific work of your generation is wasted if you do not give the same scientific, careful thought and study to the keeping of your, of our, boys and girls on the farm. To do this all forces that are working for good must get behind the movement to furnish up-to-date, clean, wholesome, cultured amusement to the growing boys and girls of the farm that they may know the "joy of living" and so stay on the farm leading wholesome, clean, God-fearing lives.

If the church, the school or the country club does not show you the way—start a Grange.

The Return of the Prodigal Son

This poor boy never would have left home if there had been an R. & V. engine on the place. Do you blame him for leaving home when he had to turn the cream separator, the grindstone, the washing machine, ice cream freezer, bone mill, corn sheller, the grinder, pump the water, milk the cows, rock the cradle, etc? But it will be different now. His folks have ordered a little R. & V. engine of GREGORY to do all this work at a cost of about five cents a day. Don't forget that GREGORY has all sizes of engines and pumps, the cheapest power in the world.

Poultry for Profit

IMPROVING THE FLOCK

Written for the California Cultivator
By Jean A. Koethen

WHAT does the European war mean to the poultry industry? As wheat prices continue to soar, and that panicky feeling to seize amateur and professional alike, while the air is filled with advice of all sorts isn't it time to get down to brass tacks, as current slang has it, and see just where we are and what is to be done about it?

First of all let us not believe for a minute that anything really serious can happen to the poultry industry. This one or that one may have to let go because of the too-narrow margin between income and outgo, and others may find it necessary to reduce stock or turn to other sources for part of their income, but the billion-dollar poultry industry is going to keep marchilng right along. Agriculture has a way of getting hard hit from time to time in this or that branch.

FIRST PRIZE EXHIBITION PEN.
—— SAN FRANCISCO CAL. 1914. ——
OWNED & BRED BY C.H. VODDEN. LOS GATOS. CAL.

Every year or so the peach crop fails or the apple crop is too big or the orange crop somewhere is small or frozen. When I was a little girl on a Kansas farm there were years when drouth spoiled the crops and years when the grasshoppers took everything and years when corn brought so low a price that it was hardly worth husking, but things went right on just the same.

Poultry is essentially a branch of agriculture, and the lesson of bad times in other lines is one of the lessons for us. Two years ago when the orange crop was frozen experts said "Diversify," and the orange growers set about looking for another basket for part of their eggs. In the South today, where the cotton crop has been as hard hit by the war as poultry raising, statesmen and agricultural experts alike are crying "Diversify," and the easy-going cotton planter is seeding part of his acres to wheat. So many other crops go well along with chickens or on land where chickens have been, that the poultry keeper, whether he be side-liner or specialist, may well consider the advisability of letting part of his stock go and raising something else in its place. He must be careful, of course, if he does this to part with only the hens that are of doubtful value as producers, for the poultry crop is short this year and will be shorter next just because of this general reduction of stock. Poultry writers East and West are predicting that the man who holds on will reap a golden harvest, only he must be sure to hold on to only what is really worth keeping.

I believe one result of the hard times the poultry industry is suffering will be the bringing into far greater prominence of the real worth of the bred-to-lay hen. There have been some very hazy notions afloat about chickens. From the day when Mr. Philo electrified the world by telling how he got rich keeping 50 hens in his back yard and Mr. Kellerstrass advertised his wonderful Peggy, who was far more valuable than the goose that laid the golden egg, just because of her "points," poultry keepers have wavered between two ideals, the bred-to-lay hen and the bred-for-points hen. Hard times are forcing us to the conclusion that however valuable and important the fancy is and however close may be "the connection between standard type and fecundity," the main thing that is to be expected from a hen is eggs. The demand for eggs is almost as certain as the demand for wheat, and they can always be produced at a reasonable profit if the hen does her duty. The trouble is that something like half the hens kept in the United States are not doing their duty (according to current calculations), and we have borne with them and humored them, partly from sentiment, partly because of admiration for fine feathers, but mostly because, in spite of the admonitions of the agricultural experiment stations, we are still quite generally in the dark as to what constitutes a good hen. If hard times clear away the mists and cobwebs and bring us face to face with the necessity of recognizing the merits of the bred-to-lay hen, they will not have been in vain. She is the heart of the poultry industry and its firm foundation as well. All honor to the good, faithful little bred-to-lay hen!

The Maine station has been doing some very practical work along the line of improving egg production by breeding, and Dr. Pearl in Bulletin 231 presents a plan which he believes may be followed by most breeders. He names the following basic elements in such an effort:

1. "Selection of all breeding birds first on the basis of constitutional vigor and vitality, making the judgment of this so far objective as possible." He would judge of the vigor

Tells why chicks die

E. J. Reefer, the poultry expert of 805 Main St., Kansas City, Mo., is giving away free a valuable book entitled "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

Peerless Poultry Supply Co., 409 E. 3d St., Los Angeles.

of each particular bird not only by its appearance and behavior when grown, but by its growth, culling out as unfit every bird which could not reach a given weight at a given age. He would also "let all deaths in the shell and chick mortality be charged against the dam, and use only those females as breeders a second time which show a high record of performance in respect to the vitality of their chicks, whether in the egg or out of it," and would "let no bird be used as a breeder which is known ever to have been ill to however slight a degree." To accomplish this he suggests putting a leg band on every bird when it shows the first sign of illness, and leaving this band on as "a permanent brand which marks this individual as one that failed to a greater or less degree to stand up under its environmental measures of constitutional vigor."

2. "The use as breeders of such females only as have shown themselves by trapnest records to be high producers, since it is only from such females that there can be any hope of getting males capable of transmitting high laying qualities."

3. "The use as breeders of such males only as are known to be the sons of high producing dams, since only from such males can we expect to get high producing daughters."

4. "The use of a pedigree system whereby it will be possible at least to tell what individual male bird was the sire of any particular female. This amounts to a pen pedigree system." Such a system is very easily operated by means of a toe punch, the chicks from each pen being punched between the toes in a different way.

5. "The making at first of as many different matings as possible. This means the use of as many male birds as possible, which will further imply small matings with only comparatively few females to a single male."

6. "Continued, though not too narrow, inbreeding (or line breeding), of those lines in which the trapnest records show a preponderant number of daughters to be high producers. One should not discard all but the single best line, but should keep a half dozen at least of the lines which throw the highest proportions of high layers, breeding each line within itself."

Dr. Pearl and his assistants have worked out a series of diagrams showing the results of mating a male of each one of nine types with high producing females. The nine types are not distinguishable the one from the other, save by the performance of their daughters and sisters, but the diagrams have this value, they show conclusively that the mating of an ordinary or inferior male with high producing hens "results in a flock of male offspring of better average quality, taken as a whole, than the sire himself. In other words the use of high producers, proven by the trapnest, as the only females for breeding purposes, grades up very rapidly the cockerels produced.

Dr. Pearl's plan will not be the last word on this question of improvement of the laying stock, but it is worth considering and acting upon and is especially valuable for the new suggestions it makes in items 1 and 5. The importance of the male in transmitting fecundity is too well understood to require comment, but the responsibility of the dam for the vitality of the germ and the chick which is hatched from it is a new idea and may be of great significance. If I understand Dr. Pearl, what he means to say is that a hen may bear all the marks of vigor and yet, for some reason, not transmit vigor to her offspring. In order to measure this breeding performance he suggests that a part of the breeding females each year be pullets, which is contrary to the established principle, "pullets for layers; old hens for breeders," but would undoubtedly be a time-saver, for a pullet that showed herself a good breeder would have at least two years of service as a breeder before her.

The standardizing of the weight of chicks of various breeds at various ages, as suggested in item 1, would also be a tremendous improvement over present haphazard methods of raising chicks. We ought to know exactly at what age a Rock or Leghorn or an Orpington should reach the broiler weight of two pounds, and breed only from birds which made that weight in standard time. We ought also to know just how much a chick of given breed ought to weigh at a month old, at six weeks, and so on. We have long been familiar with the idea that the most vigorous chicks grow most rapidly; let us take a step forward and know just how rapidly a vigorous chick should grow. The experiment stations are working at this problem, but there is no reason why every poultry raiser should not do a little experimental work of his own.

The average annual lay of the American hen, it is said, is 70 eggs. Raise this to 80 and we add (at 25 cents a dozen), $62,500,000, according to figures recently given, to the wealth of our country. Raise it to 100 and we put $187,000,000 more into the pockets of poultrymen than they now receive, enough to make up for the high price of wheat several times over. Probably it will be a good while before the average reaches 100 all over the country, but it ought to be raised very easily in California where poultry work is more in the hands of specialists than in the Middle West. It costs no more to feed a 200-egg hen than a 100-egg hen. When we raise the average of production we are diminishing the power of high prices by just that much.

ALFALFA TO HAVE NEW RIVAL AS A FORAGE

Some five years ago the office of forage crop investigations secured one-half pound of seed of Sudan grass from Khartum. The government then began experiments in Texas and so promising were the early tests that during the following years stations all over the United States have tried it out. Farmers in Texas have been planting the seed for about three years, but it has been only comparatively lately that there has been a sufficient supply of seed to distribute to the farmers of the other states.

Mr. Vinall of the United States department of agriculture says: "Yields of cured hay obtained under irrigation the past year in California and Arizona have been equal and in some cases superior to those from alfalfa. At Chico, California, Sudan grass when irrigated gave a yield of 9.8 tons of cured hay per acre against a yield of 8.3 tons of alfalfa; at Bard, California, in the extreme southern end of the state, Sudan grass on favorable soil gave a yield of 8 tons to the acre against a yield of 7.9 tons of alfalfa. The yield of 8 tons at this place was made notwithstanding the fact that the grass was planted almost a month later than it should have been.

This unusual yield of hay from an annual crop which by its nature can be made to fit into any rotation will no doubt mean much to the dairying industry of the Southwest. It has appeared just in time to solve this problem which only in the last two or three years has become acute and for which the dairymen have just been clamoring for a solution."

The advocates of this new grass claim that it is unusually drouth resistant and that it will grow in arid or semiarid districts. According to government Bulletin 605, "Practically every test of the grass made in the semiarid regions from South Dakota to Texas has given remarkably favorable results."

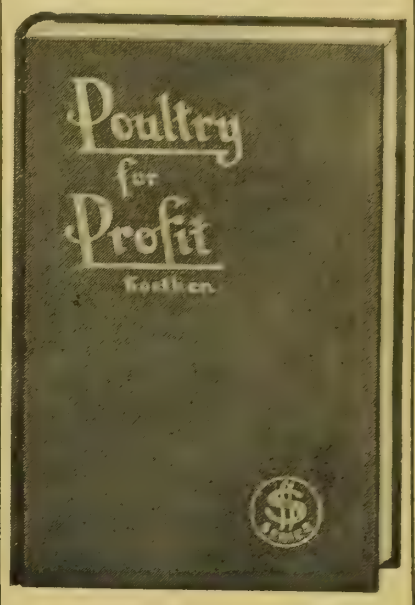
PRESERVING EGGS WITH WATER-GLASS

At present prices of eggs preserving for use a few months later is worth considering. Probably the best preservative is water-glass. We quote the following from the Cultivator's poultry book, Poultry for Profit, by Mrs. Koethen:

"Water-Glass (sodium silicate) may be bought from any druggist for 25 or 30 cents a quart, and a quart will preserve 20 dozen eggs. Boil ten or 12 quarts of water and let it cool. Then add a quart of water-glass and mix thoroughly. The mixture should be kept in a stone jar in a cellar or other cool place, and the eggs placed in it each day as soon as they are brought from the nest. Do not put in dirty eggs nor eggs that have been washed. The liquid should cover every egg completely.

"When eggs that have been in a water-glass solution are to be boiled, pricking a hole with a pin in the large end of the egg will keep it from cracking.

Meet your Business Face to Face



The Cultivator Poultry Book

Poultry for Profit

BY

Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

Where is there a thoroughly successful business person, who did not first go over carefully all the ins and outs of his future business. The poultry business is your future business; meet it face to face with all its ups and downs explained thoroughly in the book "Poultry for Profit."

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

MORE TO COME

Recently in Seattle in a cigar stand appeared the sign, "We give $15 for 1909 Lincoln pennies." No less a person was attracted by this than Judge Watson. He walked up to the counter and laying down a penny triumphantly asked for $15. The clerk took the penny, examined it closely, asked if it were genuine, and after several minutes sighed and said he guessed it was good.

"Certainly it is," answered the Judge. "Where is my $15?

"Where," said the clerk, "are the other 1908?—Life.

Foundation Stones for Success in Agriculture

CONTINUING the series published in the Cultivator of February 4. In these brief summaries different experts of the college of agriculture of the University of California have set forth the basic principles of their various specialties.

THE MARKETING AND STORAGE OF FRUITS

By A. V. Stubenrauch, Professor of Pomology

The California fruit industry is a wholesale business; large wholesale marketing and selling methods are therefore essential.

The packing, transporting, storing, and selling of fruits are phases of the industry quite distinct from the production or growing of the crops, and as such require special business training, talents, and experience not often possessed by the ordinary grower.

The problems of marketing California fruits are problems of wide distribution.

In order to market successfully the large prospective increase in the production of fruit crops, a wider and more systematic distribution over the markets of the world must be accomplished, and the per capita consumption of fruits must be materially increased.

Overproduction of fruit crops is only apparent as long as there are accessible markets which are not fully supplied; under present inadequate systems of distribution there are many such markets.

The pressing problems relating to the systematizing of marketing methods, the increase in the consumption of fruits through judicious advertising, and the broadening of distribution can be solved only through close and hearty cooperation among the growers.

The foundation upon which effective and successful cooperation among producers rests is absolute necessity for the solution of some pressing problem relating to the success of the industry.

The only true cooperative organization of fruit growers is one in which all phases of the business are under the control of actual growers, who are members of the organization.

Any organization which does not operate at actual cost to the grower members, and without profit on capital stock, is not truly cooperative in its functions.

A cooperative organization which attempts arbitrarily to control prices or curtail production in the interest of high prices is operating dangerously near to a violation of the federal anti-trust laws.

Some of the most common causes of the failure of cooperative efforts among fruit-growers: Improper methods of organization, mutual distrust and suspicion among members; inefficient, unbusinesslike, or inexperienced management.

Cold storage is a most efficient means of equalizing the marketing of fruits.

The fundamental factors underlying successful storage are: Well grown, fully mature fruits carefully handled and packed in an uninjured condition, promptly stored and quickly cooled, and held at a uniform temperature.

Cold storage cannot improve the quality of fruits—unless the product is in first-class condition when placed in storage it will not remain in good condition, and serious deterioration is sure to take place even under cold storage conditions.

The cold storage warehouse is an important ally of both the producer and consumer of fruits, enabling the one to extend the sale of his product over a long season, and the other to avoid the effects of alternating seasons of great plenty and scarcity.

NUTRITION FOR ANIMALS AND MAN

By M. E. Jaffa, Professor of Nutrition

The fundamental principles of nutrition are the same for men and animals.

Food is material which when taken into the body either builds tissue or yields heat and energy.

Foods are classified roughly according to these two uses.

If protein is neglected, growth is limited or delayed, repair checked, and resistance to disease lessened.

An excessive amount of protein is uneconomical, both physiological and financially.

Carbohydrate food gives bulk to the diet and insures an economical use of the protein.

Fat supplies heat and energy in a more concentrated form than carbohydrates and prevents an excess of bulk.

The modern standard for a ration must meet all needs of the body, maintain it in perfect health and at the highest level of efficiency.

An economical ration provides for all these needs at the least cost.

In a scientific ration the measure of the food fits the measure of the body.

The measure of the food is its nutritive value (expressed as protein, fat, carbohydrates, etc.)

The measure of the body is its size, its rate of growth, and the work it performs.

The nutritive value is the only comparative gauge of the real money value of the foods.

A balanced ration must contain the proper proportion both of the food classes and of the bulky and concentrated foods.

Protein foods are more expensive than others, in all the markets of the world.

Fresh vegetables, fruits, greens, etc., are worth more than dried foods.

All food should be fresh, sound, and clean.

Food should be purchased under pure food guarantees.

POULTRY INDUSTRY

By John E. Dougherty, Assistant Professor Poultry Husbandry

Essentials of a good poultry house: (1) Abundant ventilation, (2) strong illumination, (3) freedom from drafts, (4) dryness, (5) roominess and comfort for fowls, (6) convenience in operating and cleaning (7) as low cost as is consistent with the securing of best results.

The type or size of house affects the cost per hen of construction.

As the size of flocks increases, the risk from disease increases, the quality of hatching eggs is lowered, and the egg yield per hen generally decreases, but the cost of construction, equipment, and labor decreases.

The proper size of flocks or pens of fowls for the purpose is the one that brings the greatest net returns.

Breeding stock does best in small units.

Double-yarding permits of frequent tillage and cropping so that yards are kept in a clean, uncontaminated condition and makes it possible to keep fresh young forage growing in yards nearly the year around in California.

The greatest benefits from green feeds are secured where fowls can freely pick their own greens fresh and crisp as wanted.

Selective breeding of vigorous, good-producing stock is necessary to improve the constitutional vigor and laying qualities of a fowl.

To secure heavy-laying offspring, we must breed from matured females that are naturally high producers and from males out of such females.

The male is half the flock. His breeding qualities should receive as careful attention as those of the female.

Fowls that molt late and quickly are as a rule the best layers.

Good winter production is indicative of strong laying ability.

The trapnest is a necessary adjunct to breeding for increased egg production.

WOULD LINGER LONGER

In a storm at sea, the chaplain asked one of the crew if he thought there was any danger.

"Oh, yes," replied the sailor; "if it blows as hard as it does now we shall all be in heaven before 12:00 o'clock tonight."

The chaplain, terrified at the expression, cried out," The Lord forbid."—Life.

Little Stories of Success

No. 5

John P. Jones & Sons of Fair Oaks make a specialty of planting orchards and ornamental trees, and doing landscape gardening. Jones & Sons use no horses at all. A Baby Caterpillar pulls up stumps, hauls off tree trunks, plows, cultivates, and hauls wagons loaded with trees to be planted. Often they haul 20 ton loads from the railroad station to their nursery—a distance of 5 miles up grade. All they use is six wagons hitched on to the Baby. Jones & Sons figure the Baby takes the place of five four-horse teams.

The Baby Caterpillar is a handy tractor—it seems to fit in almost anywhere, and still has plenty of power for heavy work. There is probably one in your neighborhood.

Bean Giant Power Sprayer

A Money-Maker for the Citrus Grower

It pays to spray. Orange and lemon growers have proven it beyond a doubt. And it pays to spray right. That means a big, powerful outfit that will cover the grove quickly and drive on the spray at effective pressure.

For downright dependability—of efficient work—high pressure—ease and economy of operation—low cost of maintenance—strength—durability—and all round merit, the Bean Giant is in a class of its own. It is pre-eminently

The Sprayer for Southern California

Study the illustration. Note the complete, balanced, mechanically perfect appearance of the Bean Giant. It's built as carefully as an automobile. It's not simply an assembled outfit—a conglomeration of parts made in a dozen or twenty factories. The Bean is built complete under one roof—with the exception of the engine—and no sprayer factory could build a better sprayer engine than the Novo, with which all our power rigs are equipped.

WE MANUFACTURE A COMPLETE LINE OF HAND AND POWER SPRAYERS. BEFORE YOU BUY AN OUTFIT WRITE FOR

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

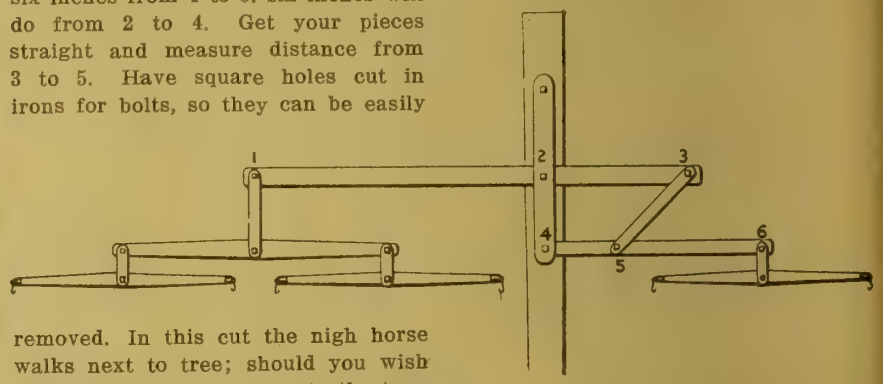
Crossing Mulefoots

I would like to know if you can cross the mule foot hog with the Poland China or Berkshire.—L. K., Mt. Hamilton.

This is being doine by some swine breeders who think they have secured a more hardy strain, but we believe there are more losses than compensations. It was at one time thought that greater immunity to cholera could be secured by this, but this has been disproven.

Three Horse Evener

By request the following is reprinted from a former Cultivator: "Two feet from 1 to 2; one foot from 2 to 3; one and one-half feet from 4 to 6; six inches from 4 to 5. six inches will do from 2 to 4. Get your pieces straight and measure distance from 3 to 5. Have square holes cut in irons for bolts, so they can be easily



removed. In this cut the nigh horse walks next to tree; should you wish to drive the off-horse next to the tree, you can reverse the plan. You must place the double tree part back six inches from the place where you would hitch two horses, or shorten traces. I am using one on a disc and do not notice much side draft."

Combs Diseased

Our chickens have disease of the comb. Combs turn yellow and little black spots appear. Finally combs become mass of rough scabs and eyes swell shut. Wattles are affected like comb.—Subscriber, Dinuba.

I think your birds have favus, a sort of mange which affects sometimes the head and sometimes other parts of the body, but the swollen eyes suggest chicken pox. Neither disease, as far as I know, begins with little black spots. In favus there is a peculiar musty odor, which is different from anything you ever smelled before, and the entire skin of the affected portion of the body is scabbed over. In chicken pox the scabs are separated and after a time drop off. Favus is easily cured by lard and sulphur, mixed half and half and applied twice a day. Peroxide of hydrogen will also kill the germ, but several applications will be required. Chicken pox is treated by removing the scabs and touching the sore spots with tincture of iodine, creolin or some other strong disinfectant. In light cases anointing the sores with carbolated vaseline is sufficient. You will have to study the symptoms and decide for yourself which disease your birds have. If it is chicken pox, the birds first affected should be well by this time. In any case, isolate all sick birds immediately and clean up thoroughly. Chicken pox germs often remain from year to year about houses that have not been disinfected, and attack each new flock. Favus is less infectious and sometimes appears when there has been no possibility of infection. I had such a case in a Buttercup pullet hatched from eggs I bought miles away. There had never been a case before in my flock and there has never been one since. My explanation is that the pullet had inherited a tendency to the disease.—J. A. K.

Native Grasses for Pasture

I have hill land which is not irrigable. It has been in oats for years. Would like to use this for pasture. What can I sow which would make good pasture during wet months, also which would cure on the root and make fair dried feed? Of course prefer a crop which will naturally reseed. The land is altogether too dry for alfalfa.—Subscriber, Escondido.

This is a very difficult question to satisfactorily answer. It is probable our native grasses would be the best. However, the question was referred to Mr. J. B. Neff, who answers: "I know nothing which will meet the above requirements fully. Bur clover does not make the best green feed but will reseed itself and makes good dry feed. Neither is it sure to make a crop every year as the rains must come early and dampness continue for some weeks in order to have the seed germinate and the young plants establish themselves. Alfilaria makes good feed and will reseed but the tonnage is small at best. Sudan grass is the most promising forage plant we have but has not been used long enough to determine its full value."

Grafting St. Johns Bread

I have a male St. Johns Bread tree. If I graft a limb from a female tree will I get beans only on the limb grafed or on the whole tree? If only on the one limb would it be wise to graft most of the limbs?—B., Pasadena.

If you graft your male St. John's Bread tree to a good female variety, leaving but one branch in the center of the tree to furnish pollen, you will get plenty of fruit on all your worked-over top.—J. W. M.

Green Almond

I have green almond eight years old; it is like St. Johns Bean, dioecious. How old are they before they bloom?—B., Pasadena.

Your almond should bloom when three years old, very often they bloom at two years.—J. W. M.

Salt On Butter

Why does salt show on the outside of butter after it stands for several days?

Salt grains appearing on the surface of butter is caused by the evaporation of the water at the surface, thus leaving the dry salt. In working

butter half or more of the salt before working is squeezed out. This, however, has no relation to salt appearing on the surface of the butter roll as the result of evaporation, as such a thing is apt to occur if the atmosphere is dry. It can be prevented or lessened by wrapping the butter in parchment paper similar to that used in all creameries or by wrapping in a moist cloth.—L. A.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Anonymous

We are receiving so many unsigned letters and the department is becoming so filled that there must be some reduction, therefore we are again compelled to announce that anonymous communications will not be given attention. As soon as a letter is opened the signature is looked for, and if not found—no matter how helpful a question it may be—the waste basket will get it. This is an invariable rule and yet there is scarcely a day that unsigned letters are not received at the office. In some cases these letters have the full address of the writer on the envelope, and it is possible the envelope has been thrown away before this fact is observed, so it is best always, in addition to putting the name on the envelope, to attach it to the letter. We scarcely ever use the name, and certainly will not when it is indicated that name should be withheld.

Again, subscribers will send remittances in a letter and on the same sheet ask a question intended for the editorial department. It will expedite matters if the question or matter intended for the editorial department is written on a separate sheet with full name and address on it. It will then receive immediate attention.

Surrendering Contract

I made agreement to purchase real estate. Made three payments and find myself unable to continue. Wish to know as to my liability. In my contract it is provided that—"It is further agreed that time is the essence of this contract, and if the party of the second part shall fail, or make default in any of the payments by said party of the second part herein as the same mature or become due, etc., then this agreement may be terminated and cancelled at the option of the party of the first part." According to this the party from whom I purchased may terminate the contract, but another clause provides: "The foregoing covenants run with the land, and upon the breach of any one thereof, the said property shall revert to the said grantor." Does not this allow me a lapse without any liability?—Subscriber.

The grantor upon these real estate contracts has two methods of procedure. He may treat the contract as an agreement to purchase and bring action for the balance due or he may elect to rescind for failure upon the part of the purchaser to complete the contract and retain monies paid by way of damages for non-fulfillment of contract. If the land is taken back you would not be under further liability, but the option is with the seller of the property.

"WINTER RHUBARB, CULTURE and MARKETING"

By

Reginald Bland

A complete manual of field culture for this valuable crop, filling an important vacancy in Agricultural Literature. Chapter titles are: **Rhubarb and Winter Rhubarb, Selection of the Location, Preparation for Planting, Planting, Culture, Picking and Packing, Marketing, Propagation and Development.**

This new book will be useful to successful growers; **Invaluable** to beginners, to prospective planters and to those who may have been unsuccessful; Interesting and Instructive to all.

The strenuous pioneering years are over. Recent developments have brought new life and impetus to rhuburb culture. One company, shipping from 200 to 250 cars annually (over 90 per cent of the total California production), says, "We now have more customers on our books than we have rhubarb"—and only a few of the big eastern markets have been supplied. Every one who wishes to profit by this great opportunity should have the sound, practical instruction and advice to be found in

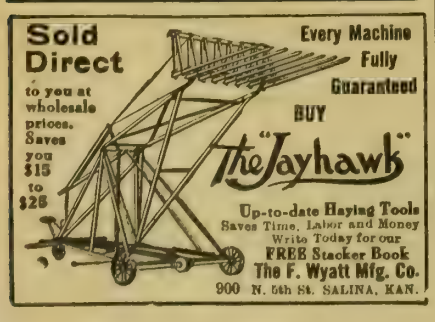
Wood Pipe for Irrigation, City Systems, Mining Power Plants

Send for copy Mining Catalog No. 7, Tank Booklet, or Pipe Booklet.

All full of valuable information.



Irrigation Ditch

I have a 20-acre tract of land, just inside the city limits. A water company has an open cement irrigation ditch along the entire front of my 20-acre tract. It is very hard to cross and during the irrigation season it is running full of water a greater part of the time. Can I compel company to cover this ditch, and what would be the proper course to pursue? Could it not be declared a nuisance and abated in that way?—Subscriber, Anaheim.

I fail to see any legal liability upon the part of the company to cover this ditch or bridge the same. I have never known an irrigation ditch to be held a nuisance in California.

Road Right

A owns a ranch in canyon and B owns a ranch above him in the same canyon. B has no other way out except by going through A's ranch. Both places were homesteaded 25 or 30 years ago. Can A charge B at least one-third of what his ranch is worth for privilege of driving through, or can A fence B out?

Having owned your property for so long it is very probable that you have acquired a right-of-way through your neighbor's land, but from the information given, it would be impossible to say that. It is certainly true that no one is required to allow another to pass over his property simply because the other desires to do so.

Contract for Deed

How soon may one be dispossessed of land which is now held under contract to deliver deed? Contract for purchase of the land was made some years ago and all payments have been kept up and all taxes paid. Now if, on the final payment, there is a lapse of a few days or weeks could the purchaser be dispossessed immediately or would court action be necessary and would it give opportunity to the purchaser for redemption?—Subscriber.

There is no definite time within which one in possession of real property under contract can be dispossessed, as it is necessary for the seller of the property to bring action in the superior court to rescind the contract for failure upon the part of the purchaser to keep up the payments. This is an action in equity and the courts frequently allow some specified time, such as in their discretion is deemed equitable, to allow the purchaser to complete the payment.

Tubercular Cow

A has a herd of cows for sale and B comes and picks out some, pays for same and takes them home. After several months one of these cows is condemned as tubercular. Who has to stand the loss? She was never tested for tuberculosis or guaranteed from this or any other disease. —Subscriber.

It appears that B made an inspection of the cattle and chose them himself. Unless A made a warranty to the effect that the cattle were free from tuberculosis he is not liable to replace the animal lost.

Shooting Quails and Rabbits

Has one a right to shoot quails and rabbits on his own place out of season when they are destroying crops? Also is there a season on rabbits this year?—Subscriber, Encinitas.

There is a closed season for cottontails and bush rabbits from the 1st of February to the 1st of August. There is a provision in the penal code under the game laws to the effect that where a wild bird is found destroying berries, fruit or crops growing on the premises, it may be killed by the owner or tenant of such premises, but shall not be shipped or sold.

Delinquent Water Dues

A farmers' cooperative ditch company distributes irrigation water to its stockholders. The water is furnished by a canal company at the cooperative company's headgate. A number of stockholders have become dilatory in paying their annual maintenance assessments. Is it therefore legal to withhold the water from delinquents without interfering with the usual rights exercised by the canal company over these lands? If not what is the proper procedure to force collection of this assessment?—Director, Biggs.

Without an inspection of your articles of incorporation or by-laws it is impossible to give you an entirely correct answer, but there is no rule with which I am acquainted that prohibits a water company from cutting off water supply from such parties as do not pay for it. It would seem that you would also have the right to bring action against the delinquents for the amounts due from them, but you should take the matter up with some attorney who can inspect your company, before taking any action.

Leased Machine

A leased a machine from C and ordered $18 worth of goods from B. Shortly after B asked C to guarantee the bill. C refused but promised to go after A about it. He promised to pay, but did not. B sent the bill to C who refused to pay. B has given bill to collecting agency.—Subscriber, Burbank.

You do not state the kind of goods purchased. If they were merely oil or goods to be used up in the operation of the machine, there is clearly no liability upon your part. If they were additions to the machine, as in the nature of nuts, bolts, wheels, etc., you would be required to reimburse B for the value thereof, unless you could separate such goods from the machine and return them to him.

Width of Road

I own 20 acres in the center of a section and according to abstract my boundary lines run to middle of 60 foot roads, 30 feet having been deducted from my land on each of three sides. Kindly advise if this width of road is not illegal except on outside boundary roads of section?

The statute relative to the width of highways provides that all public highways except alleys, lanes and trails shall be at least 40 feet wide, and it has been held that the board of supervisors has power to provide for a road wider than 40 feet.

Soldier's Scrip

I am desirous of getting information on what is called soldier's scrip. Can an old soldier assign his right to anyone, and will the party he assigns to have to pay anything to the government after he has bought the assignment, or how do you proceed to acquire title?

A warranty for soldier's scrip is assignable and would thus be made subject to sale by the person entitled to obtain it from the United States government. When such warrants are located on lands worth more than $1.25 per acre, the difference must be paid, but where the land is worth only $1.25 and not exceeding the area specified in the warrant, it must be taken in full satisfaction. Such warrants must be located upon contiguous land.

Notes Against Estate

A man died leaving an estate but no will; no indebtedness except two notes of $1,000 each. His wife furnished the greater part of the purchase price of the farm, which she has never put in a claim for, and in case she did there would not be enough left of the husband's share to pay the notes. Would such notes bear interest? Are they valid and just? The heirs are his widow and ten children. The two notes were given on his death bed, are not signed by the wife.—Subscriber, San Diego.

Notes are mere evidence of indebtedness in the hands of a payee. Consideration for such notes is at any time subject to inquiry, and in the administration of the estate the wife would undoubtedly be entitled to put in her claim for the monies furnished. It is entirely probable that the notes you refer to could be entirely set aside.

Water Rates

We hold contracts with an irrigation company whereby they agreed to furnish water for 50 years at a fixed rate per acre per year. These contracts have been running for upwards of 10 years in some instances. Company is now petitioning the railroad commission to overrule these contracts and fix a uniform rate for all users of water, claiming that the

The Household Department

A PRETTY GOOD WORLD

This world's a pretty good sort of world,
Taking it altogether.
In spite of the grief and sorrow we meet,
In spite of the gloomy weather,
There are friends to love and hopes to cheer,
And plenty of compensation
For every ache for those who make
The best of the situation.

There are quiet nooks for lovers of books,
With nature in happy union;
There are cool retreats from the noon-tide heat,
Where souls may have sweet communion;
And if there's a spot where the sun shines not,
There's always a lamp to light it,
And if there's a wrong, we know ere long
That heaven above will right it.

So it's not for us to make a fuss
Because of life's sad mischances,
Not to wear ourselves out to bring about
A change in our circumstances;
For the world's a pretty good sort of world,
And He to whom we are debtor
Appoints our place and supplies the grace
To help to make it better.
—London Tid-Bits.

APRIL PRIZE CONTEST

April 30 is Raisin Day when all good Californians celebrate the richest product of the vine. Therefore our next contest in the issue of April 22 will be for raisin recipes.

Send your favorite, one only, and please write on one side of your paper. All recipes should be in this office by the morning of Thursday, April 15.

Cash Prizes

Two dollars will be given for best recipe; $1.00 for second best. All recipes published will entitle sender to three months' extension of subscription to the California Cultivator. If you have already received one extension for subscription this year you are not entitled to further extension for recipe furnished. With your recipe send name of member of your family now receiving the Cultivator that extension may be properly credited.

Any suggestions as to further contests are gladly received. Mrs. R. J. Fuller of Fairmead writes:

"Would suggest for another contest recipes for dishes made from other grains and cereals than those commonly used. I have in mind whole grains, such as wheat, Egyptian and kafir corn to be found on most ranches and much cheaper than the same product manufactured into 'cereal foods' in packages. Another time, palatable dishes from beans of various sorts. There are numbers of farmers' wives who have to prepare meal after meal without help of meat dishes" Both these suggestions we shall follow in these contests.

Mrs. Geo. F. Herrick of Riverside writes: "I have been thinking that many would like to know of other people's ways of economizing. We are never too old to learn. I am past the three score age but can still learn and have learned many things from very humble workers. Let us try it for one or two papers."

That surely appeals to everyone of us.

PRIZE WINNERS

The first prize this month is awarded to Mrs. Gertrude H. Brink; the second to Mrs. A. L. Vandiviere.

Rice Prepared in Many Ways

RICE growing has become an important industry in California. In the Sacramento Valley lands particularly it has passed the experimental stage and thousands of acres will be grown there this season.

As a California product we are of course interested in it, but as a valuable food product, capable of preparation in many ways, it appeals most strongly to our housekeepers. Dr. Wiley, our noted food expert, says: "It is a food rich in starch and poor in protein, and furnishes, therefore, heat and energy, and is well adapted for the nourishment of those engaged in hard labor or who undergo extreme physical exertion." Boiled rice furnishes 89 per cent carbohydrates, 10 per cent of protein and only 1 per cent of fat.

Our subscribers have furnished a great number of recipes for cooking rice and we regret exceedingly that lack of space forbids publishing all. Less than one-tenth of those received can be published this week. We shall, however, use others in later issues as space permits.

To Cook

During five years residence in the Philippine Islands, where rice is the chief article of food, I learned to cook it as it should be cooked, so that each grain is whole and separate and not a pasty, unappetizing mass. One of the most important factors is getting the proper kind of rice. It must not be broken. The Filipinos use broken rice only as a food for chickens and as a grain for horses. Ask your grocer for the unbroken head rice. Another important thing is proper and thorough washing. Wash it in hot water, scrubbing between the hands, and then rinse several times in cold water until the water does not show any milky white coloring.

Rice cooks more perfectly on a wood or coal range or over an oil heater if you have one in use for warming the room, than it does over the gas flame. If gas is used put an asbestos mat under the dish as soon as it boils but be sure to keep the water boiling.

The proportions are one cup of rice to four cups of salted water. I put the cold water on the rice and set it over the gas flame until it boils, then place it on the range to finish cooking more slowly. Cover the dish and boil the rice until it is dry. Do not disturb it by stirring as it will not burn nor stick if you have followed directions. When the water is boiled away so that the rice will not move when the dish is tipped sideways you will find it tender and fluffy and wholesome. If the heat is sufficient to cause it to boil over, place the cover so that a little of the steam will escape and it will continue to boil without boiling over.

Serve with cream and sugar if desired. It is especially nice if fresh or preserved berries or sliced peaches are sprinkled over after the cream has been poured over the top of each dish Mrs. Gertrude H. Brink, Riverside.

Plain Boiled Rice

To avoid broken and heavy flakes as well as a "sticky" kettle try the following method:

After thoroughly washing (do not soak) a cup of rice toss into a quart and one-half of boiling salted water. Stir for two or three minutes to prevent sticking and keep the water boiling continuously for 20 minutes. Remove from the stove and toss into a sieve. After all the water is drained, rinse thoroughly with cold water and

I Want to Show You This 40 ACRE EQUIPPED FARM

LAND: Level, clean, strong; no brush or stumps; ready for plowing; between two railroads and within 1½ miles of stations on Southern Pacific and Western Pacific. In the Upper Sacramento Valley.
SOIL: Deep San Joaquin loam.
WATER: Unlimited water at 20 to 25 feet.
EQUIPPED: with a plow, a harrow and a cultivator, a pumping plant complete, trees and seed.
SPECIAL: This land is absolutely above all flood from rivers; the titles are clear and guaranteed; there is no bonded indebtedness; there are no reclamation or irrigation assessments. This is clean, strong land without incumbrance of any kind.
THE PRICE is $150.00 per acre with equipment, or $125.00 for the bare land. Terms, ¼ cash, balance 6 equal annual payments, 6%. I want to show you this specially selected piece of land.

OUR CO-OPERATIVE BUYING SERVICE

Will enable you to get any acreage, in certain selected tracts, at strictly wholesale values. You should know about this—write today.

An Overproduction of Apples ?

The present demand for apples in the United States, including those used for export, is placed by the Department of Agriculture at 55,000,000 barrels. If that many apples were raised in this country there would be no overproduction. Figures from the Department of Agriculture show there has been an average annual decrease of 25 per cent in the apple production during the last nine years. The serious shortage that exists for apples is attributed largely to the dying out of the old orchards and the insufficient plantings of new ones.

The Yucaipa Valley, eight miles from Redlands, altitude 2400 to 3000 feet, is the place to plant an apple orchard, and this is the time of year to visit Yucaipa and see what you would have if you had planted four years ago. It is not too late to make a start.

Come to Redlands and let us take you to Yucaipa and show you our five, ten and twenty acre tracts at $285 per acre, on very easy terms. One share of stock in a Mutual Water Company with each acre.

HOME MADE ACETYLENE
Safest Light and Cooking Fuel
Insurance records prove it

Insurance records show this—the misuse and abuse of city gas, kerosene and gasoline caused over 100,000 fires in six months. While the misuse and abuse of acetylene caused but four fires during the same period. And there are over a quarter of a million COUNTRY-HOME-ACETYLENE-PLANTS in use. A mighty fine showing for acetylene.

A hundred feet of acetylene makes more light than a thousand feet of city gas. For this reason acetylene light burners have small openings — so small that not enough gas could escape from an open burner — in a whole day — to do any harm whatever.

Also, acetylene gas is not poisonous to breathe — you would suffer no harm in sleeping under an open unlighted burner. Also, acetylene burns with no odor whatever — but acetylene from an unlighted burner has a strong pungent odor which immediately attracts attention.

Also, acetylene lights are permanently fastened to walls and ceilings — they cannot be tipped over.

Also, the acetylene producing stone, UNION CARBIDE, won't burn and can't explode.

For these reasons insurance authorities have pronounced acetylene safer than illuminants it is displacing.

Our advertising literature tells all about the best way to make acetylene for country home use, and how it is used extensively for cooking as well as lighting. Just address—

-STEVENS-
VISIBLE LOADING REPEATING RIFLE

This No. 70 is both quick and safe. And when we say safe we mean *very safe.* Every cartridge is visible as it moves from the magazine into the chamber--you *know* if your rifle is loaded. The Stevens Visible Repeater takes fifteen 22 short cartridges, thirteen 22 long cartridges or eleven 22 long rifle cartridges--all rim-fire. Bead front and elevating rear sights. 20 inch round barrel, blued frame, rubber butt plate. Length over all 35 ins. Weight 4 1-2 lbs. A beauty! *List price only $8.00 but dealers sell it at $7.00, except west of the Mississippi River and in Canada.* With this accurate rifle you don't *guess;* you know that drawing a bead *gets the game.*

Write us today for the "STEVENS RIFLE BOOK." It is FREE and tells everything you want to know about Rifles, Pistols and Rifle Telescopes. Latest expert information, with pictures and descriptions of all the wonderful line of STEVENS Rifles.

When writing advertisers, mention The Cultivator.

set aside in a warm place until ready to use. Serve with cream and sugar. —Mrs. G. A. Grober, Cohasset, Minnesota.

Rice Griddle Cakes

One pint of boiled rice, two pints milk, one and one-half pints flour, three eggs, one teaspoon each of baking powder and salt, one tablespoon each of sugar and melted butter. Put the cooked rice to soak over night in a pint of milk and in the morning add the flour, salt, sugar and butter. Beat the mixture well and add eggs well beaten, and the other pint of milk into which the baking powder has been stirred. This makes quite enough cakes for six or seven persons. —Mrs. Edith Warner, Willits.

Rice Waffles

Two cups flour, one-half teaspoon salt, one tablespoon baking powder, one egg beaten separately, one tablespoon butter, one cup milk, one cup cold boiled rice, one-half cup rice water. Sift dry ingredients together into a bowl. Make a hole in the center, into which put the rice and the water in which the rice was boiled. Add the well-beaten yolk of the egg, the milk and melted butter. Stir until thoroughly mixed. Beat well and add gently the white of the egg, beaten to a stiff froth. Fry in a well-greased waffle iron.—Miss Elsie Pedroia, Lodi.

Rice Gems

To one cup of cooked rice add one well beaten egg, one cup sweet milk, one teaspoon salt, two teaspoons baking powder, mixed with enough flour to make a soft dough. Put in greased gem pans and bake in hot oven.—Mrs. R. W. Edmiston, Sanger.

Browned Rice

Wash rice; dry evenly and place in oven until golden brown. Put one cup of browned rice in double boiler, add three and one-half cups of hot water, a little salt and steam until done. Serve with cream.—Gretchen Rueff, San Fernando.

Rice Croquettes

These answer for a luncheon dish. Melt two tablespoons of butter in a saucepan; stir in one tablespoon of flour, half a cup of milk and mix over the fire until boiling. Then add two tablespoons of chopped onion, a cup of boiled and drained rice, a chopped, hard-cooked egg, a tablespoon of chopped parsley, a beaten egg, salt and pepper to taste and four tablespoons of chopped nut meats. Turn out to cool and stiffen. Then divide into even portions and form into neat croquettes. Roll in bread crumbs; brush over with beaten egg and again coat with bread crumbs. Fry in smoking hot fat, and drain.—M. J. Wilkinson, Warrenton, Oregon.

Rice Fritters With Jelly

Put one cup of rice in a double boiler, cover with boiling water and let it boil ten minutes, then drain through a wire sieve; rinse off with cold water and return to the double boiler, in which one pint of milk and one level teaspoon of butter have been heating. Boil until the rice is soft and the milk quite thick. Turn the whole into a large bowl and let stand until cool. When cold mix with the rice three tablespoons sugar, yolks of four eggs, four tablespoons flour, a little salt. Mix thoroughly. Beat the whites of the eggs to a stiff froth and fold in the batter. Drop from a spoon in hot fat and fry a golden brown. When done, dust with powdered sugar and pile on a plate. Serve with currant jelly or plum jam in a separate dish. Very nice for luncheon.—Mrs. H. R. Franck, Clovis.

Baked Rice

Butter the sides and bottom of a one-quart granite pan. In it put one pint of water and two level teaspoons salt. When water is boiling stir in one cup carefully washed rice. Cover and place in oven until rice has absorbed all the water (about 20 minutes). Add one tablespoon sugar, one-third teaspoon pepper, one small chopped onion, one-half can tomatoes, one pint water and one cup chopped ripe olives. Cover and bake until rice is cooked and almost dry. Keep covered all the time. A cup of chopped walnut meats may be added instead of the olives, or strips of bacon may be placed over the top—in which case the rice should be left uncovered at the last long enough to brown the bacon.—Mrs. W. C. Heim, Dehesa.

Spanish Rice

Fry five slices bacon, add one scant cup rice, enough water to cover, one section of garlic, one large onion, two bell peppers, chopped. Season with salt, pepper, cayenne, chili sauce, can of tomatoes and one pound grated cheese. Cook slowly till done. "Left over" beans or meat are delicious when fixed this way.—Mrs. Harry A. Perry, Ferndale.

Baked Rice

Boil about three-quarters of a pound of rice until about half done; remove from fire; add a little milk and four or more eggs, some chopped mushrooms, parsley and garlic, and onion chopped fine and fried in olive oil. Season with olive oil, salt, and plenty of black pepper; stir thoroughly. Bake in pan well greased with olive oil until nicely browned.—Mrs. W. A. Heckman, Turlock.

Kedgaree

One cup boiled rice, two cups left-over fish (I like barracuda or halibut); season with pepper, salt and butter and one egg. Cook slowly about five minutes. Garnish with hard boiled egg, whites cut up, yolk grated on top. Nice for breakfast.—Mrs. Shults, Spring Valley.

Liver Jambalaya

Chop one pound of liver and stew until tender. Fry one onion in a separate pan and add a pint and a half of cooked rice, then add liver with one-half teaspoon (scant) of cayenne and black pepper; salt to taste. For shrimp jambalaya use one can of shrimps instead of liver.—Mrs. G. W. Haber, Sanger.

Potato Rican Rice

One cup rice, one onion, two tomatoes, one chili, piece of ham, piece of bacon.

Fry out the bacon and ham (cut in small pieces), adding a little lard if necessary. In this fry the onion, tomatoes and green chili. Add the rice until each kernel is covered with grease. Add several cups of water and let boil slowly until the rice is soft and nearly dry. Serve as a vegetable.—Mrs. R. V. Langford, National City.

Rice and Eggs

This dish not only takes the place of meat but also of vegetables. Put six eggs in warm water, bring to boiling point, and cook slowly for fifteen minutes. Boil one cup of washed rice, drain and dry slightly in oven. Cut eggs into neat halves crosswise, take out yolks carefully, and mash with them two sardines. Add a tablespoon of melted butter, half a teaspoon of salt and a teaspoon of pepper, roll into small balls and put back into whites. Turn rice in centers of plates and smooth it over. Stand the eggs in the rice and pour over it one-half a pint of white sauce, garnish with greens and send at once to the table.—Miss Pearl Threewit, Hemet.

Rice Milanaise

Put one cup milk into a double boiler with a slice of onion. When scalding hot, add a cup of cooked rice. Cover and let stand for 20 minutes. Mold into rounds and hollow out the inside of each. Fill with chopped

chicken and decorate with sliced pickled beets.—I. E. J. H., Ontario.

Stewed Lentils With Rice

Wash thoroughly one cup of lentils. Cover with cold water, soak over night and drain. Cover with fresh boiling water and cook slowly for an hour. While the lentils are cooking boil a cup of rice till tender, drain and stand to dry in oven. Do not stir or mix. Melt a tablespoon of butter in saucepan. Add four tablespoons of minced onion. Simmer till onions are soft but not brown. Add two tablespoons tomato catsup, a dash of nutmeg and a pinch of marjoram. Drain lentils, add to onion, stir thoroughly, then add the rice; toss all well together; season with one teaspoon salt and dash of paprika. Serve at once.—Mrs. U. A. Squires, Palmdale.

Rice and Cheese

Wash one cup of rice and boil slowly in two cups of boiling salted water for 20 minutes, or use cold left-over rice. Put alternate layers of rice and grated cheese in a baking dish having a layer of cheese on top, and over this pour one-half cup of milk; put in hot oven until cheese browns on top. Serve the same as macaroni and cheese.—Mrs. La Rue C. Watson, Hilo, Hawaii.

Turkish Rice

Pick over and wash one cup of rice. Cook in one pint of chicken broth well seasoned with onion, celery, salt and pepper. Let the rice cook in this until it is soft and has absorbed all the broth, then add one tablespoon of butter. Have ready one cup of cold chicken, minced; heat one cup of gravy or stock and season it well. Put chicken into gravy, either mix meat and rice, or put meat in center of dish and arrange rice in border around it. I use any cold left-over chicken I may have at hand, using bones and trimmings for making the broth.—Mrs. A. L. Vandiviere, Moreno.

Fried Chicken With Rice

Take one and one-half cup of rice, wash and spread over the bottom of a sheet iron pan. Take a young chicken, cut into pieces, dip into flour and fry to a nice brown, then lay it on top of the rice. Add pepper and salt to taste, and enough cold water to almost cover the chicken, cover so as not to have it dry out, set into oven and cook for about two hours, or until chicken is tender. If rice swells enough to make it look dry add more water. It is well to taste the rice before it is done to see that it has enough salt. When done place chicken on a platter with rice around it, or put into a separate dish, as preferred.—Mrs. L. S., Escondido.

Japanese Stew

Take two medium-sized onions and a half head of cabbage, slice them fine and let cook in water till tender. While cooking season with salt, pepper and a tablespoon of cooking fat, lard, cottolene or meat fryings. When almost done add a pint of canned tomatoes, or four ripe tomatoes. (If ripe tomatoes are used it should be cooked longer).

Take one cup of rice, wash thoroughly, and let cook in salt water till tender. Put in about twice as much cold water as rice. Serve hot with the above.—Mrs. J. C. Rogers, Fullerton.

Rice in Casserole

Into a small casserole put one cup cleaned rice, one-half teaspoon salt, enough boiling water to more than cover—say two cups. Cover, cook in oven for one hour. Do not touch. Remove cover and dry out for ten minutes. Try it.—E. S. F., Madera County.

Curried Rice

This dish is a good accompaniment for stewed chicken. An hour and a half before dinner place one cup of rice in one cup of water on the back of the stove. As the rice begins to swell, add chicken broth from the top of the kettle. Repeat this at intervals until the rice is done. Just before the rice is done season with one spoon of mustard and pepper and salt to taste. This is not a hard times dish, as it requires a chicken in the pot, but is a delectable accompaniment to your Sunday chicken dinner.—Caroline M. True, Lancaster.

Rice Custard

Boil one-half cup rice. Scald one-half cup milk. Beat three eggs, turn in the boiled rice, stir well, salt and pepper to taste. Then add the milk after it has cooled. Butter a baking dish and turn in the mixture. Bake until the custard has set. A little grated cheese on top adds to the flavor. This is a very good luncheon or evening tea dish.—Mrs. J. H. Brohaska, Chula Vista.

Creamy Rice Pudding

Wash one-fourth cup rice thoroughly. Add to it one quart of milk and cook in double boiler until rice is tender (about one and a half hours). Remove from stove. In separate dish beat one egg and add three-fourths cup of sugar, pinch of salt, vanilla to flavor, and nutmeg. Add this mixture to rice and milk and bake in moderate oven ten or fifteen minutes, or until custard is set.

When cold this pudding is creamy and delicious.—Ruth E. Flint, Kelseyville.

Rice Pudding, Known Also as "Creamy," and "Poor Man's Pudding"

Soak for half an hour three tablespoons of washed rice and three tablespoons of sugar (rounded measure), in a quart of milk in a baking dish. Then bake very slowly, stirring up from bottom two or three times. Bake two or three hours, or till rice is soft, whole, and surrounded by a rich, creamy syrup. It should not bake dry, nor be underdone. When just right it is the queen of all rice concoctions, and may be served hot with butter, or cold with cream. Raisins, quartered apples, or prunes, may be cooked with rice to give variety.—Mrs. Ed Conant, Escondido.

Rice as Dessert

One-half cup rice, two sliced apples, one-half cup sugar, one quart milk, one egg. To one quart milk add rice, apples, sugar, pinch salt and cook in double boiler. When nearly done beat egg in rice. Flavor with vanilla or cinnamon. Served with or without whipped cream makes a delicious dessert for about four.—H. A. B., Casa Grande, Ariz.

Rice and Apricot Pudding

This makes a dainty pudding. For it are required one-fourth pound rice, two pints of milk, a little butter, two tablespoons of sugar, two eggs and about seven or eight apricots cut in halves and peeled. Put the rice into a pan with the milk, sugar and butter, and let it simmer gently for one hour. Turn out and when partly cold add the eggs well beaten. Simmer the apricots in syrup until quite tender; butter a mould; place in it a layer of rice about one inch thick, then some pieces of apricot and fill the mould with alternate layers of rice and fruit. Bake in a moderate oven; when done turn out and serve with custard. Other fruits can be used instead of apricots, pineapples, peaches or apples being especially suitable.—A. Butcher, Healdsburg.

Rice Surprise

Wash half a cup of rice in several waters and put into a saucepan with one cup of cold water. Let boil quickly until the water is absorbed; then

Light Your Home by Electricity

Easier on the eyes—more convenient—more economical. Cannot burn nor shock. Easy to install.

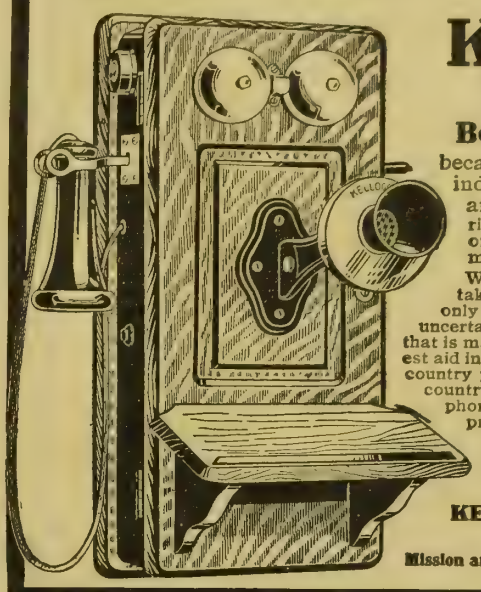
UTILITY GUARANTEED LIGHTING PLANTS COMPLETE Plants $200 Up 3 Year Guarantee

Light your barn, stables and grounds as well as your home. One plant does all and you have light anywhere at the turn of a switch. Write for catalog and Special Introductory Offer

Western Utilities Co. 402 W. 33rd St., Los Angeles, Cal.

Final Telephone Efficiency

YOU can get it from the instrument shown here. One of the Kellogg kind. Works on any kind of a line and with any kind of telephone. Rings clearly with 40 telephones on the line. Compact, durable, light. Less wall space. Unbreakable receiver and mouth piece. Lightning arrester. Secret service push button to ring Central without ringing neighbors. No repair bills. 5 year guarantee on transmitter.



KELLOGG Telephones Best in the World

because they are made in the largest independent factory in the world and have to undergo the most rigid tests ever devised. There are 37 of the tests and none but a Kellogg made instrument could stand them.

Why not know real phone service. Why take chance on cheaper instruments that only mean in the end repair bills and the uncertain weak transmission of messages that is maddening. The telephone is the greatest aid in the world in linking up the lines of country people with the whole world, but the country man of today wants the best telephone. Send us your name and we'll prove to you that there is a reason for Kellogg world-wide reputation. Also will see that you get much valuable and interesting telephone information free. *Write for bulletin No. 24*

HAY

Under date of March 20 Scott, Magner & Miller say:

Receipts of hay for the past week were 2982 tons, a trifle less than the previous week, 3309 tons. Trade is extremely light and receipts very large. Fancy grades of red oat hay are extremely scarce. Alfalfa remains about the same as heretofore. Offerings are quite liberal and demand light. Straw remains unchanged.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Fancy Wheat Hay (light
  bales) 11.00@12.00
No. 1 Wheat or Wheat and
  Oat 9.00@10.50
No. 2 Wheat or Wheat and
  Oat 6.00@8.50
Choice Tame Oat 10.50@11.50
Other Tame Oat 6.00@9.00
Barley 5.00@8.00
Wild Oat 6.00@8.00
Alfalfa 6.00@9.00

Citrus Fruit Market

LOS ANGELES, March 24, 1915.

One thing peculiar about present marketing conditions is that the trade discriminates against all decayed fruit alike, that is, if one orange in 20 only is decayed, the cut is practically as severely made as if one orange in every three were decayed. The explanation is that the better trade will not take a car showing any decay if it can help it, and with the enormous number of cars to be marketed the trade is very independent. Peddlers and those willing to take chances on the decaying fruit do not seem to discriminate and pay practically the same for 35 per cent as for five per cent decay. One noteworthy point in present conditions is that California and Florida have marketed up to March 1, 27 per cent more fruit than last year same date, and this in face of a year when financial conditions are very difficult. While financial conditions are depressed as at present it is an impossibility to force the market, especially for products which are not in the class of absolute necessities. This depression has cut the heart out of any possible profit for the producer for the reason that overhead expense remains as in the past and every penny of the cut falls on him.

The lemon market is practically the same as the orange market with a very faint promise of improvement in the near future.

Shipments

Shipments of oranges to date from Southern California since November 1, 1914: 12,207 cars; lemons, 1558; total, 13,765. To same date last season: Oranges, 13,533; lemons, 7787; total, 14,320. From Tulare County: Oranges, 5136; lemons, 172; total, 5308. To same date last season: Oranges, 4598,; lemons, 30; total, 4628. From Northern California points: Oranges, 627; lemons, 1. Last year same date: Oranges, 3398; lemons, 5.

CULTIVATOR—MARKETS

NEW YORK, March 22.—Thirty cars navels, one bloods, one navels and navelencias, five navels and bloods, five navels and Tangerines, two navels, Tangerines and bloods, and three cars lemons sold. Market strong on both oranges and lemons. Partly cloudy.

RICE RECIPES

(Continued from Page 381)

add two cups of milk and two tablespoons of butter. Simmer until the rice is thoroughly cooked and the mixture rather thick.

Rinse out some small moulds, three-quarters fill them with the rice, and make little hollows in the centers. Put one teaspoon of some kind of fruit preserve into each, fill up with more rice, and set aside to cool. When firm turn out on dishes, and pour around them a sauce made as follows:

One pint milk, three egg yolks and two whites, one-half cup powdered sugar, one teaspoon vanilla. Put the milk on the stove and let get hot, beat the eggs and sugar together until light and creamy, then stir into the boiling milk and stir over the fire until it begins to thicken but no longer or the sauce will curdle. Take from fire and stir in the vanilla.

Beat the white of egg that is left to a stiff froth, add one tablespoon sugar, a little vanilla and drop in teaspoons on top of the moulds of rice. This makes an unusually pretty dish if the beaten egg white is colored pink. —Mrs. E. L. Putman, Stockton.

Puffed Rice Candy

One cup sugar, three-fourths cup water, pinch of cream of tartar. Boil until it spins a thread. Have crisp puffed rice in a large dish. Flavor syrup and pour over rice, stirring rapidly until all the syrup is taken up.—Bertha L. McAuslan, Princeton.

LEGAL QUERIES

(Continued from Page 378)

water is being furnished in many cases at an actual loss. The hearing is set for April 6. Now what rights have we in the premises? Again what are the bounds of the authority of the railroad commission in such cases?—Subscriber.

It has been held that a contract for service with a public utility water corporation is made subject to the power of the state to substitute a rate fixed by the proper authorities for the rate agreed upon by contract, and that in such substitution the rate is within the power of the state and does not come within the provision of the constitution of the United States forbidding a state to impair the obligation of a contract. The power of the railroad commission is plenary with regard to public utility water corporations; although it has bounds which could not be stated here. The procedure of the railroad commission is first to inquire into the investment by the water company and to fix such a rate as will make a fair return upon such investment, taking into consideration for the establishment of its rates the history of the company, its possible sources of revenue, present and future, and its probable sources of development, present and future, whether or not it is operated in the most economical manner and also the location which the company serves.

The railroad commission has been of great service to the consumers from utility corporations. There are many instances, however, of decisions which have resulted in apparent injustice, which have been due to insufficient presentation of the case from the consumer's standpoint, such insufficient presentation resulting from either a too parsimonious attitude in the presentation of his side of the case or insufficient investigation or knowledge of the matters to be presented before the commission. It would be for your interest to retain the best counsel and best engineer in your locality that you can procure, and it would seem from your statement that it would be entirely possible for you to show that your rates should not be changed.

Property of Wife

If a woman whose husband does not support her takes up homestead can the husband in case of her death claim any of the property left for the children?—R. M. T.

The earnings and accumulations of the wife while living separate from her husband are her separate property and would be absolutely subject to disposition by her in a will; however, in case of her death without will, leaving more than one child, one-third would go to the husband and two-thirds to the children to be divided equally among them.

Administration of Estate

Real property was purchased by funds inherited by the husband, but title was taken under name of husband and wife, wife undivided one-half owner. In case of death of wife would administration be necessary and in such case what would be the administrator's fee and would it be necessary to sell the home?—Subscriber, Westminster.

In order to clear title to the property an administration of the estate would be necessary. It would not be necessary to sell the home. The husband would have the first right to the administration of the estate and would be entitled to a fee of seven per cent upon the first $1,000 and four per cent upon the next $10,000, but these fees in cases such as this may very frequently be made by contract much smaller.

Reserved from Sale

A sold ranch to B and reserved the bath tub in the house and asked the privilege of leaving it on the ranch. When A went after it B refused to give it up. There was no written agreement, but several persons heard the conversation. Can B keep the tub? If not, what will A do to get his property?

A should bring an action and replevin the bath tub, as it is quite evident that he never sold it.

EVERLASTINGLY

Percy—Lend me a five, old chap, and I'll be everlastingly indebted to you.

Reggie—That's just what I'm afraid of, old fellow.—Pathfinder.

SPRINGS OF CALIFORNIA

Twelve years ago an investigation of the underground water of California was begun by the United States geological survey, and it has been carried on generally with financial cooperation on the part of the state. Later it became apparent that a study of the springs was desirable, particularly of those which yield mineral waters and which are utilized to a greater or less extent by citizens of the state and by tourists as recreation and health resorts.

This work was begun in the summer of 1908 when Gerald A. Waring was assigned to the task of collecting and assembling the necessary data. His report has just been published by the United States geological survey as Water-Supply Paper 338.

The immensity of the area of the state has made the collection of the field data required a task of considerable magnitude. In the original plan it was estimated that two years of field studies would prove sufficient. In midsummer, 1910, however, Mr. Waring was called by the Brazilian government to take charge of general water-supply investigations in the northeastern arid portion of Brazil, and on that account the task of finishing the report on the California springs was left to others.

California, with an area of 158,000 square miles, is the second largest state in the Union. It exhibits wide geographic diversity, for it includes the lowest area in the United States—Death Valley, 276 feet below sea level, and the highest, Mount Whitney, 14,501 feet above the sea. Similarly there is a great diversity in scenic effects, climate, and vegetation. Records obtained at meteorologic stations in the Salton Sink indicate a maximum temperature of 130 degrees in the shade, the highest recorded within the continental United States, while it is probable that minimum temperatures on the higher peaks, like Mount Whitney and Mount Shasta, approach the minimum within our boundaries, a total difference of nearly 200 degress. Records of rainfall in the most arid sections of the southern deserts of the state represent the extreme of aridity in the United States, showing an annual average of less than three inches and periods of 12 months or more with only traces of rain, whereas the precipitation in northwestern California is very heavy, an annual average of close to 100 inches being recorded at a few stations in Mendocino and Del Norte Counties.

In the report it was found impracticable to discuss the springs of California with any regard to order of importance, for this depends on the extent to which they are or may be improved. Some of the springs which are most remarkable from the viewpoint of the geologist or the chemist were in 1908-1910 unused, while those at several large resorts are of relatively minor scientific interest. It is believed however that the report, setting forth the results of impartial observations upon one of the most important resources of the state will prove of value to its citizens as well as to its visitors and that the material will not be without interest to physicians, chemists, geologists, and instructors who may have especial need for such information.

SAUSAGES AND ART

Robert Henri, the painter, was talking about those millionaires who buy, merely to show off, doubtful "old masters" at fabulous prices.

"Their knowledge of art," Mr. Henri said, "is about equal to that of the sausage manufacturer who said to Whistler:

" 'What would you charge to do me in oil?'

" 'Ten thousand dollars,' said Whistler promptly.

" 'But suppose I furnish the oil?' said the millionaire."—Dallas News.

scientific buying

Big, carefully managed corporations that spend hundreds of thousands of dollars annually for mechanical equipment, never purchase a single type of machine without first thoroughly investigating every make on the market.

THE YUBA BALL TREAD TRACTOR

We believe the farmer should manage his farm as carefully as any big corporation – that he should invest in, rather than buy, farm equipment.

The automobile has supplanted the horse and buggy as a means of getting to town. The tractor is rapidly taking the place of the horse in heavy draft work on the farm and along the road.

Selling off the horses and buying a tractor to replace them is a big step. It should be made carefully.

We have boiled down every bit of information regarding The Yuba Ball Tread Tractor, its uses and construction, into twenty-four pages of pictures and plain English. It will help you in gathering data regarding tractors.

For convenience, use the coupon.

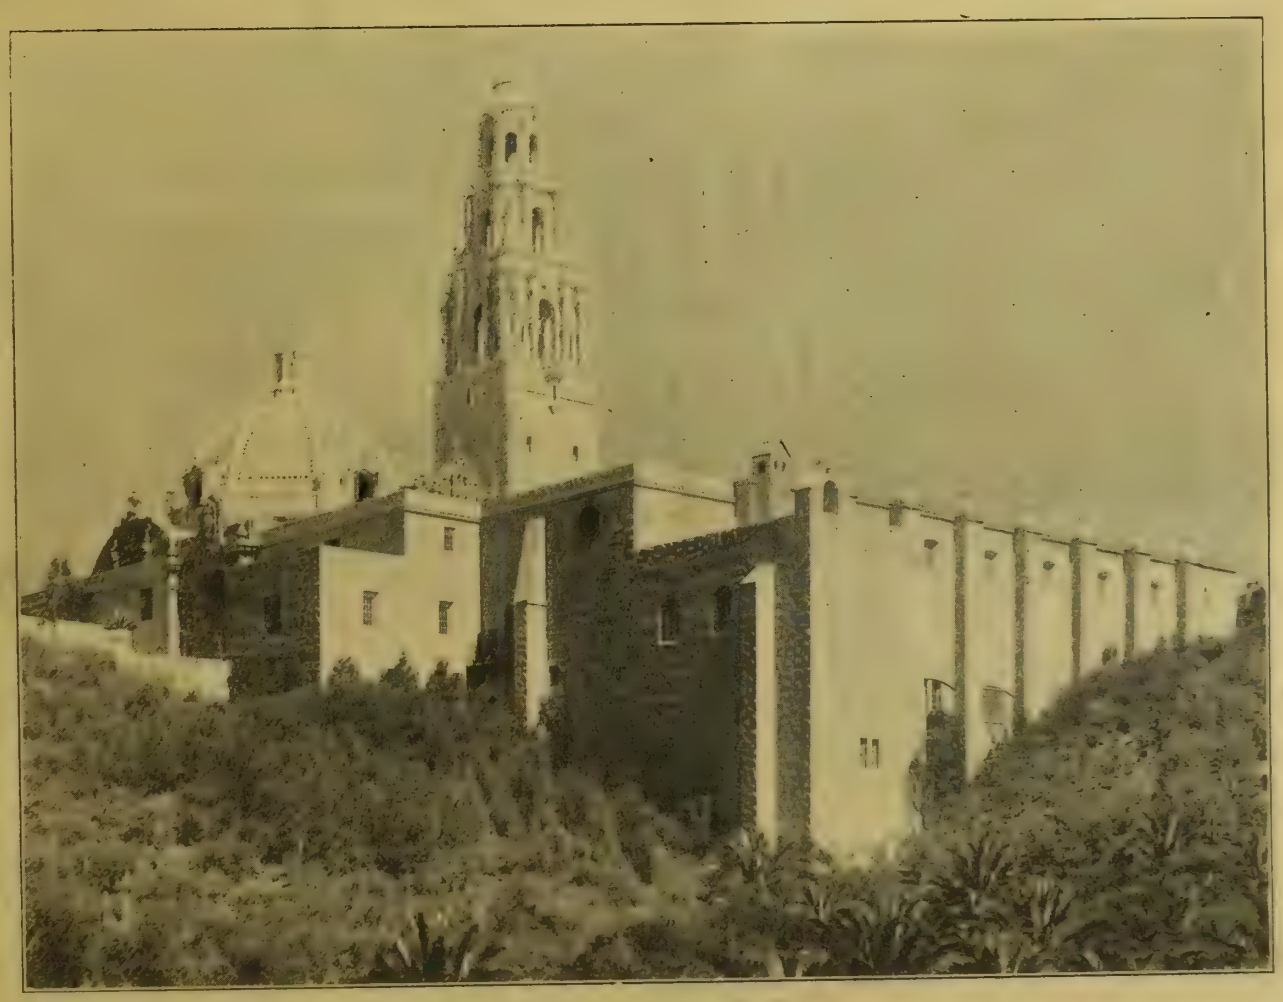
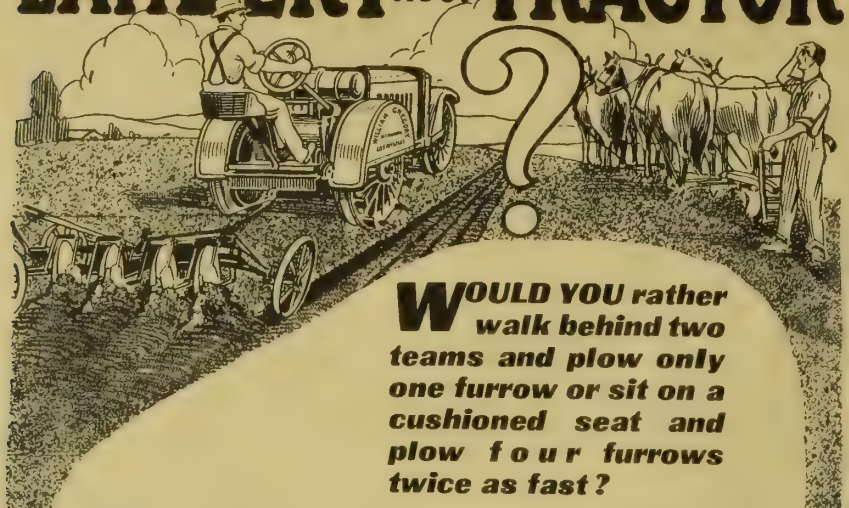
LOS ANGELES April 1, 1915 SAN FRANCISCO

Tower of California Building at Panama-California Exposition, San Diego



LAMBERT STEEL HOOF TRACTOR



WOULD YOU rather walk behind two teams and plow only one furrow or sit on a cushioned seat and plow four furrows twice as fast?

Of course you'd rather do the latter. You can if you own a Lambert Tractor. It will run all day on less than a dollar's worth of fuel. It easily does the work of 8 or 10 horses and only one man's services are required. You can use it to plow, harrow, disc, cultivate, haul crops to market, for running power machinery and in many other ways. It's the one and only Tractor for ranches of all sizes.

For field work, the Steel-Hoofs on the Lambert effect a positive traction—no chance of wheels slipping. For road work the Tractor runs on rubber tires and travels from 10 to 15 miles per hour. Built for years and years of dependable service. It reduces the cost of traction, eliminates labor.

Call and see the Lambert work. You'll be convinced it's the Tractor to buy. Descriptive booklet on request.

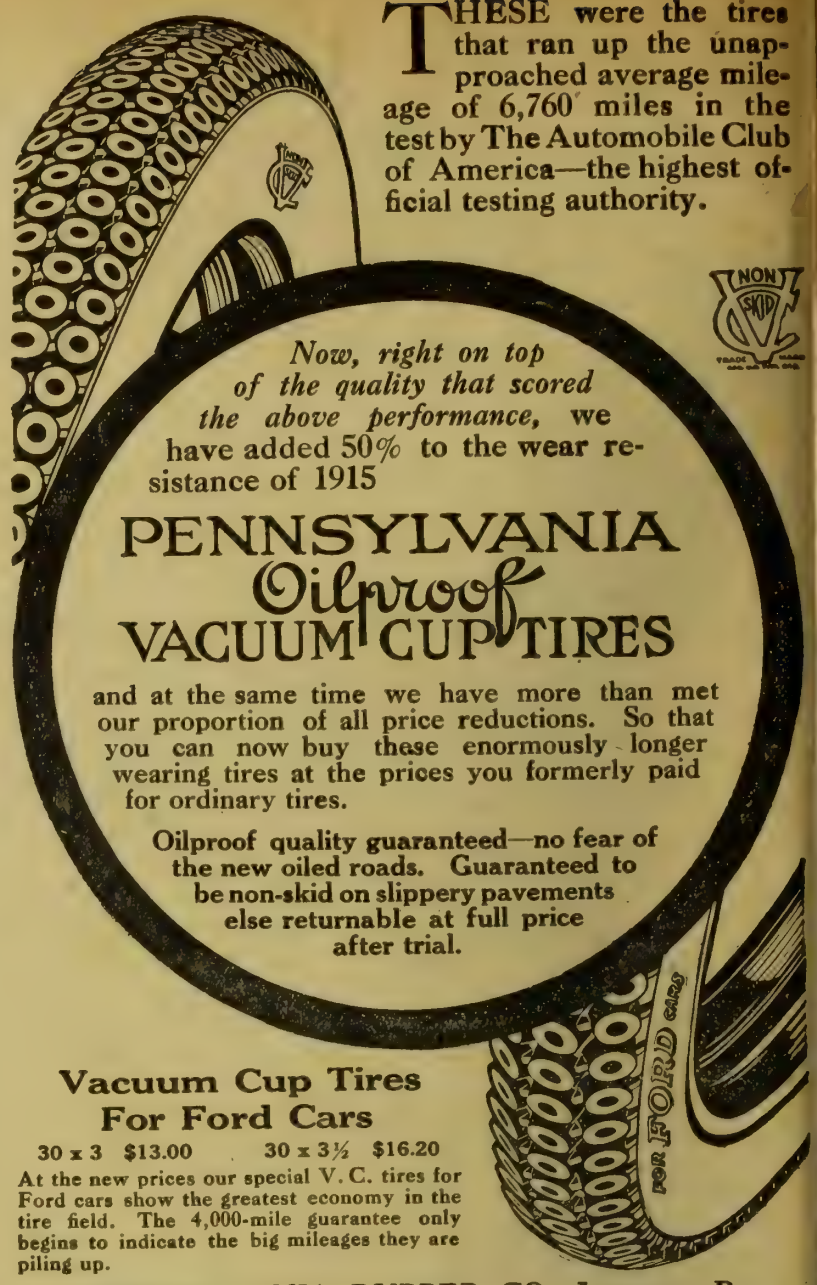
READ-MILLER

THESE were the tires that ran up the unapproached average mileage of 6,760 miles in the test by The Automobile Club of America—the highest official testing authority.



Now, right on top of the quality that scored the above performance, we have added 50% to the wear resistance of 1915

PENNSYLVANIA Oilproof VACUUM CUP TIRES

and at the same time we have more than met our proportion of all price reductions. So that you can now buy these enormously longer wearing tires at the prices you formerly paid for ordinary tires.

Oilproof quality guaranteed—no fear of the new oiled roads. Guaranteed to be non-skid on slippery pavements else returnable at full price after trial.

Vacuum Cup Tires For Ford Cars

30 x 3 $13.00 30 x 3½ $16.20

At the new prices our special V. C. tires for Ford cars show the greatest economy in the tire field. The 4,000-mile guarantee only begins to indicate the big mileages they are piling up.

Panama-California Exposition

San Diego's Beautiful Exposition is Attracting Many Visitors. Architectural and Landscape Work Have Combined to Make This One of the Most Beautiful Expositions of its Kind the World Has Seen

SINCE the raising of the bear flag, the discovery of gold, the telling to the world of the mighty sequoias, the wonderful crops and fruits, the ghest mountain and the lowest val- y in America, and always of its won- rful climate, California has been in e world's spot light. Nineteen fif- en is no exception. The spot light rns easily from Europe's nightmare the world's most beautiful exposi- on. The Panama-California — The xposition Beautiful—The Dream City, on the hills overlooking San Diego, ronado Islands and the Pacific cean is beautiful beyond description. is a bit of old Spain or of Spanish merica on Columbia's soil, but with e old Spain refined and beautified.

It was not my privilege to see re- nt world's expositions, but a San ranciscan who has seen all in re- nt years remarked after a few urs' walk over the grounds of the an Diego Exposition, "Well, I am in y far the most beautiful exposition have ever seen. Its wonderful Spanish atmosphere, its gardens, its trees, its flowers, its quaint old buildings make a picture like unto dreams of Paradise and make me long to live here always."

In the art gallery is a room devoted to "The Genealogy of Exposition Architecture." It's interesting and instructive. In the picture of the Bridge of San Martin, Toledo, Spain; in the Court of the Lions of the Alhambra, a twelfth century structure; in the Tower of Cathedral at Cordova; in the Giralda, Seville, a fourteenth century structure; in Santa Cruz hospital, Toledo, Spain; Church of St. Sophia, Constantinople; the Sagrario Cathedral, Mexico City, and in other cathedrals, public buildings and bridges of Spain and Spanish America may be seen arches, domes, facades and lines which have been reproduced in buildings of the Panama-California Exposition. Here at San Diego is the same beautiful architecture, unmarred by the usual barrenness or squalor so closely associated with those great structures in other countries. Here is horticultural harmony and beauty.

Architectural and landscape work of the exposition have been under direction of Frank P. Allen, who was also architect of the exposition at Seattle. He and his corps of workers have occasion to be proud of their accomplishment.

Some of the buildings are permanent. The beautiful bridge across Cabrillo Arroyo, Puente Cabrillo, the California building and other features, especially the landscape effects, are a permanent heritage.

But, agriculturally?

There is no live stock. But in implements, farm power and farm production, there is a fine showing. Tractors insist on being seen and demonstrations in field and orchard give opportunity to see them as the farmer would use them. Yes, there are orchards and fields within the grounds. Southern California has featured a little 17-acre ranch, a model which every Easterner—and some of the rest of us—covet. On the 17 acres is a $4000 home completely furnished and with large lawn, garage, workmen's cottage, cow stable, citrus orchard, deciduous orchard or plot, a little alfalfa, and garden plots with all kinds of vegetables, poultry yards with record card on each gate showing what the poultry is doing, and—well everything that makes you hanker for the like of it.

Every section of California is represented. Fronting on the Plaza de Panama is Sacramento Valley with a large building filled with Sacramento Valley products. Just below on one side of the approach to the great outdoor organ is San Joaquin Valley, excepting Tulare and Kern, which are in their own building on the opposite side and facing their sister counties. Both contain magnificent exhibits.

Southern California has besides her model farm a large structure filled with exhibits and with rooms for entertaining and resting visitors.

The whole exposition is an example of California glad-handing, for the cozy restful places are beckoning one at every turn.

Every reader of the Cultivator will surely go.

The Feeding Problem

Dr. Leroy Anderson Writes for Live Stock Readers of Feed Value of Cottonseed Meal and Ways of Securing Greatest Return from Least Expenditure

COMPARISON of a few common and new feeding stuffs.

The figures in the table below are all from California Bulletin 132 except for cottonseed and cottonseed hulls, which are from Henry's Feeds and Feeding edition of 1911.

Feeding Stuff	Dry matter in 100 lbs.	Digestible Nutrients in 100 lbs. Protein	Carbohydrates	Fat	Nutritive Ratio
Wheat bran	88.3	11.2	42.2	2.5	1:4.3
Wheat middlings	88.3	12.2	53.4	3.8	1:5.1
Barley rolled	90.0	9.6	63.5	2.1	1:7.1
Corn, Indian	89.4	7.8	66.7	4.3	1:9.8
Rice bran	89.5	10.7	41.8	10.6	1:5.9
Rice hulls	89.0	2.7	30.8	.8	1:12.1
Cottonseed	89.7	12.5	30.0	17.3	1:5.5
Cottonseed meal	90.2	41.1	15.4	11.0	1:1.0
Cottonseed hulls	88.9	0.3	33.2	1.7	1:123.4
Linseed oil meal	89.1	26.1	38.5	6.5	1:2.0
Cocoa oil meal	85.9	16.4	42.4	9.7	1:3.9

The Texas station in Bulletin 47 reports an experiment in which cottonseed meal was fed in quantities varying from two to ten pounds daily to a 1000-pound cow. Other foods in the rations were wheat bran, oats, corn meal, cottonseed hulls, sorghum hay and corn silage. The time was 1898 when cottonseed meal was quoted at $15.00, hulls at $3.50, and wheat bran at $15.00 per ton. Six groups of cows were fed with a change of ration during four periods and the most effective rations per group in any period are given as follows:

Group 1—Six pounds cottonseed meal and 25 pounds cottonseed hulls. Nutritive ratio, 1:5.05.

Group 2—Seven pounds cottonseed meal, 16 pounds cottonseed hulls and 28 pounds silage. Nutritive ratio, 1:4.5.

Group 3—Six pounds cottonseed meal, 18 pounds cottonseed hulls and 35 pounds silage. Nutritive ratio, 1:5.8.

Group 4—Four pounds cottonseed meal, six pounds bran, 18 pounds cottonseed hulls and 35 pounds silage. Nutritive ratio, 1:6.6.

Group 5—Four pounds cottonseed meal, six pounds corn meal, 18 pounds cottonseed hulls and 35 pounds silage. Nutritive ratio, 1:8.1.

Group 6—Four pounds cottonseed meal, six pounds oats, 18 pounds cottonseed hulls and 35 pounds silage. Nutritive ratio, 1:7.4.

The report does not state the effect of large quantities of cottonseed meal upon the quality of butter, but deals quite entirely with economic production of milk and butter. It is well known that cottonseed meal has the effect of producing a hard and tallowy fat in butter, and for this reason the feeding of such large amounts as reported by Texas is discouraged. As compared to corn meal the effect of cottonseed upon the body fat, the Texas station reported in Bulletin 29 that beef tallow from cottonseed fed steers had a higher melting point by 8.7 degrees centigrade than tallow from corn meal fed steers. The effect upon butterfat is even more marked. The quantity usually recommended for dairy cows is from two to four pounds daily per head of cottonseed meal.

Whole Cottonseed

In Imperial Valley whole cottonseed is fed in considerable quantities to dairy stock during the part of the winter season when pasture is short. In December for instance a typical sight along side a milking stable is three piles of feed—one of alfalfa hay, one of milo or sorghum fodder and one of whole cottonseed. At my last visit to the Imperial I found dairymen most enthusiastic over the results obtained by feeding cottonseed.

The flow of milk was increased and some assured me that the actual percentage of fat was materially increased. As to the latter I would like to see some careful experimentation. Some feed as high as six pounds of seed per head daily but the usual feed is two and one-half to three pounds per day. As compared to cottonseed meal, the Texas station found that as a fattening ration cottonseed at $12 per ton was cheaper than cottonseed meal at $26. For dairy stock it is probable that the seed is worth about one-half as much per ton as the meal. In the cotton belt of the South little whole seed is now fed owing to the great demand for cottonseed oil and for the meal in European markets as well as at home. As the oil manufacturing develops in Imperial Valley it is probable that the feeding of whole seed will greatly diminish.

A glance at the table at the head of the column shows how very rich in protein is cottonseed meal. In 90 pounds of dry matter there are 41 pounds of digestible protein and there is one pound of digestible protein for every pound of carbohydrates and fat when the latter is calculated on the carbohydrate basis. The use of cottonseed meal is thus indicated when other available feeds are rich in carbohydrates, as for example, corn silage or any of the corn products and fodders, oat, barley or wheat hay.

ORANGE TREES

2-year-old budded trees. Clean, vigorous, well-shaped, and well-balled stock. Thousands of splendid NAVEL and VALENCIA Orange Trees at snap prices. Ready to PLANT NOW.

LEMON TREES

EUREKA—The famous commercial variety—prolific bearer. Clean, strong, new stock, balled at the right time, and fresh from our nurseries, at greatly reduced prices. BUY them NOW.

OLIVE TREES

California favorites—**MISSION** and **MANZANILLO.** Clean, southern grown stock, properly topped when dug. All ready for strong, rapid growth. The season is right. PLANT NOW.

FIGHTING SCALE IN TULARE

Written for California Cultivator
By Chas. F. Collins, Horticultural Commissioner, Tulare County

WHEN preparations were being made for the first campaign against the gray scale (Coccus citricola) in Tulare County in the spring of 1914 there was naturally a great diversity of opinion as to when the work should be begun, how conducted, and how long continued, and each of these questions constituted a fair sized problem for people whom circumstances had heretofore so favored as to make it unnecessary to acquaint themselves with the solution of such difficulties.

With an energy however that is characteristic of Tulare County citrus growers the matter was discussed at public meetings held for that purpose and a method of procedure agreed upon. The first thing to determine was, when could we begin commercial work that would be successful in killing the scale without injury to the young fruit. As the life history of this insect has never been worked out and fumigation never practiced under our climatic conditions, the solution of this question required careful study and painstaking experimental work. The best authorities in the federal and state service were very apprehensive of success and offered little in the way of encouragement to fumigation as it was supposed to be practically impossible at a temperature above 70 degrees Fahrenheit, and it was thought the habits of the scale were such as to make it necessary to confine our operations to our two hottest months of July and August. The supervisors generously assisted in the work by appropriating money for the purchase of 185 tents and equipment, together with material for doing the work, which sum was a charge against the property fumigated and was returned to the county by the growers for whom the work was done. The services of Mr. C. P. Wilkinson, a practical fumigator of Riverside, were secured for conducting some experimental work to ascertain at what time we could safely begin commercial operations.

The young scales began to issue about the middle of April, and on the night of June 10, the first experimental fumigation work was done. Ten badly infested 10-year-old navel trees were covered, and dosages ranging from one-half to three-fourths of Woglum schedule No. 1 were used, resulting in no injury of importance to trees or fruit, which was less than the size of hickory nuts, and a complete killing of all young scale which had issued from beneath the old shells. The old scales, however, and the young still beneath the old shells were found to be more or less immune to the effects of the hydrocyanic acid gas. In all our work nothing but the 96 to 98 per cent sodium cyanide has been used, which is equivalent to 128 to 130 per cent potassium cyanide.

The experiments were continued with constantly increasing success until July 23, at which time the young were nearly all out and work was begun in a commercial way. Mr. H. P. Cundiff, for many years horticultural commissioner of Riverside County and a veteran scale fighter, was secured to superintend the fumigation work which was successfully continued without interruption, except for two or three showers, until November 19. Full schedule No. 1 was used till about September 1, when the cooler weather and maturity of the fruit allowed an increase of 10 per cent in the dosage. This was found necessary, owing to the fact that as the scale advanced in size it was more resistant to the effects of the gas and proved perfectly safe, as no damage resulted to trees or fruit. During the heated period work was conducted at a temperature of 80 degrees Fahrenheit on many occasions and always with perfect success and some experimental work was done at 87 degrees Fahrenheit without injury.

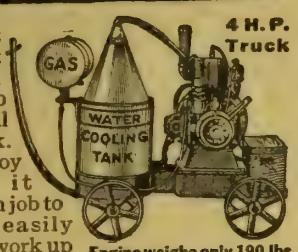
After the commercial work was discontinued experiments were again conducted till December 5 with dosages as high as 125 per cent with almost perfect success in killing scale and absolutely no injury to trees or fruit, proving beyond a doubt this work can be carried on here with entire success from July 20 to December 10, and probably later, practically without interruption so far as climatic conditions are concerned. This practical demonstration that the work can be conducted through a period of 19 or 20 weeks instead of six of eight as was supposed, is of incalculable benefit to the industry, as it gives ample time for control work and overcomes what would otherwise have been an almost insurmountable difficulty.

Various sprays, mostly different forms of oil and distillate emulsion, were thoroughly tested and some commercial work was done with them through the entire season, resulting in conclusive proof that two sprayings were absolutely necessary for effective work and even then the efficiency was far below the average of fumigation at the same cost. It was clearly demonstrated that spraying anything but very young trees for this pest on a commercial scale is not a practical means of control.

This very brief epitome of facts concerning the control work done in the citrus orchards of Tulare County during the season of 1914 is written for the purpose of correcting in a measure the many exaggerated and ridiculous items that have crept into the press from irresponsible sources.

Tulare County horticulture has always been blessed in its freedom from the more serious insect pests and today the gray scale is the only really serious one we have, and with the improved and cheaper methods of fumigation now prevailing and the long season which our climate affords for successful control, this mountain has dwindled to a mole hill. The growers are beginning to regard correct fumigation in the light of an investment yielding large returns rather than an expense, and the enthusiasm with which preparations are now being made for future operations indicates bad luck for the gray scale.

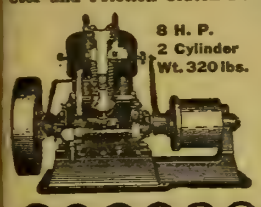
Light Weight Cushman Engines For All Farm Work



Engine weighs only 190 lbs.

This Light Weight Cushman Truck is so handy for all power work. So light a boy can pull it around from job to job, yet it easily handles all work up to 4 or 4½ H. P. **Runs at any speed** desired, speed changed while running. Pump circulation to water tank prevents overheating, even on all-day run. All Cushman Engines are **Throttle Governed—Steady and Quiet**

No jerky, explosive hit-and-miss running. They are the **most useful engines** for farm work, as they do everything the big fellows do and so many jobs big engines cannot do. May be attached to binders and other machines as power drive. Equipped with Schebler Carburetor and Friction Clutch Pulley. **Not a cheap engine,** but cheap in the long run. Sizes 4 to 20 H. P.



Engines Distributed from Pacific Coast centers. Write for free Engine Book.

VALUABLE TREES

In the issue of the Cultivator of the 11th, appeared an item regarding the government having received nearly $100 for one tree, and commenting upon it as being almost unheard of. I have one avocado tree that does this year after year. Last year the yield of fruit was over $400. In the one case the tree is gone, while in the other the tree is still standing, more thrifty than ever.—Wm. Chappelow.

It is interesting to have information as to these valuable trees. The one planted by nature and battling with it on the mountainside affords a somewhat different illustration, however, from the tree in the California garden and under peculiar circumstances. As to single trees, there are others which, it has been claimed, have produced thousands of dollars in a year. At one time the Cultivator referred to an acre of strawberries which produced $2600 gross income and caused great interest at the time, but let this not be taken as an indication of averages any more than the exceptional tree sold by the government. That was of interest in part because the government has not in the past taken charge of these trees and given them attention and protection. This it is now doing and it is satisfactory to know that the trees are making return for the service. We hope the avocado and others of our fruit trees will be as responsive. We believe they will if we use judgment in their planting.

CITRUS MARKET PROBLEM

Written for California Cultivator
By Albert Young

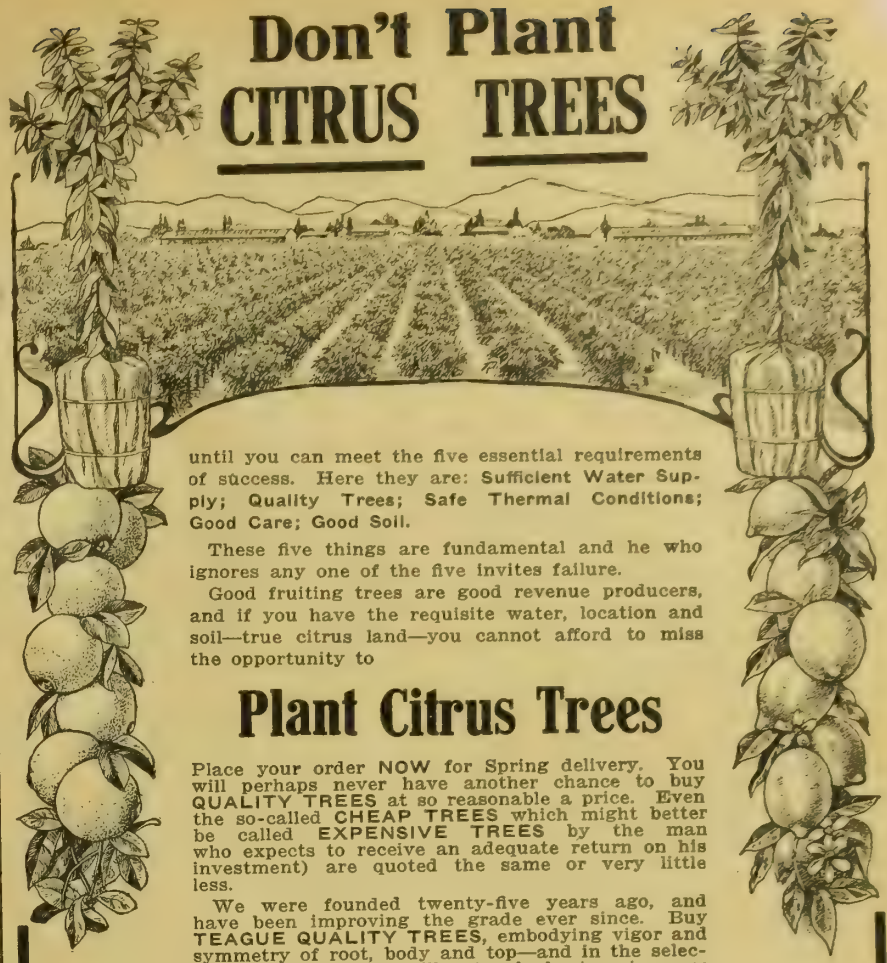
I notice editorials, articles and correspondence in late numbers of your paper embracing a varied discussion as to the low prices—and causes therefor—of California oranges and olives and olive oil. Having interests in California and having spent several months there during the past winter I had occasion to think about and discuss the same question. The prices of oranges were lower than I have before known them in California, and you say the olive growers complain that there is no sale or demand for olives or olive oil. I observe in the local markets that the oranges were very cheap, but when I went to purchase olive oil and ripe olives in the stores of Los Angeles and Pasadena I found very little change in the prices. These standard brands of ripe olives and olive oil were selling at from $3.00 to $4.00 per gallon. How much does the producer get of that?

On returning to Kansas City I took occasion to look into the question of prices in the retail grocery stores of oranges, lemons, olives and olive oil. I found that while the demand and prices for oranges and olives and olive oil in California were limited and oranges at the lowest price, there was no change in the price in these stores for any of these articles from the prices of last year. First-class California oranges are sold here in all the leading stores at from 40 to 50 cents per dozen; ripe olives and olive oil from $3.00 to $4.50 per gallon, a trifle more than the price in Los Angeles. This bears out the conclusion of Mr. G. Harold Powell in your March 18th number in his article, "The Cost of Distributing Oranges," wherein he arrives at the conclusion that the retail dealer who handles these products gets most of the "milk in the cocoanut" when he receives 33 1|3 per cent of the producer's dollar. I found occasionally in Los Angeles and Kansas City that there were "special sales" on these articles at long intervals when you might buy them at a reasonable price. As an instance, I bought a gallon can of very fair quality of ripe olives in a large department store in Los Angeles at 39 cents per gallon. I found that same grade of olives was selling in Kansas City at 75 cents per quart.

There should be some remedy for this inequality of burdens and unless something is done the California Fruit Growers' Exchange will have to establish retail stores in all the cities of the country or else the retailer will absorb all the profit of the business and the producer of these articles will receive but a bare living from the results of his labor.

I trust you will continue the work you have started in seeking a remedy for this state of things or the producer will have to go out of business.

Don't Plant CITRUS TREES



until you can meet the five essential requirements of success. Here they are: **Sufficient Water Supply; Quality Trees; Safe Thermal Conditions; Good Care; Good Soil.**

These five things are fundamental and he who ignores any one of the five invites failure.

Good fruiting trees are good revenue producers, and if you have the requisite water, location and soil—true citrus land—you cannot afford to miss the opportunity to

Plant Citrus Trees

Place your order **NOW** for Spring delivery. You will perhaps never have another chance to buy **QUALITY TREES** at so reasonable a price. Even the so-called **CHEAP TREES** which might better be called **EXPENSIVE TREES** by the man who expects to receive an adequate return on his investment) are quoted the same or very little less.

We were founded twenty-five years ago, and have been improving the grade ever since. Buy **TEAGUE QUALITY TREES,** embodying vigor and symmetry of root, body and top—and in the selection of buds, which will not only be true-to-name in the general acceptance of the terms, but true to the best type of the varieties to which they belong as well.

Deciduous Fruits

ROOT-KNOT A DESTRUCTIVE DISEASE

NEARLY 500 kinds of plants are already known to be susceptible to root-knot, and it is probable that future observations will greatly increase this number. Known under the names of root-knot, root-gall, big-root, etc., this disease does immense damage out-of-doors in all except the most northern states and everywhere causes damage in greenhouses. It is due to a minute parasite of the nematode family sometimes known as an eelworm, which causes the roots of susceptible plants to become so enlarged that the transfer of water to the stem and leaves is seriously interfered with. On the other hand the entrance of harmful fungi or bacteria is made easier. In the case of cotton, for example, the root-knot parasite may be present in such small numbers as not to cause much harm itself but may nevertheless prepare the way for wilt or black-root, a fungous disease.

The seriousness of root-knot is pointed out in a new publication of the United States department of agriculture Farmers' Bulletin 648, "The Control of Root-Knot," which discusses the most feasible methods of eradicating the disease. Under ordinary circumstances, says the bulletin, the most satisfactory method is to raise in the infested fields for a period of two or three years crops that are immune to the parasite, carefully killing at the same time all weeds and susceptible plants. Of the highly resistant crops the most important are:

Barley, beggarweed, brabham cowpea, broomcorn millet, corn, crabgrass, iron cowpea, peanut, pearl millet, redtop, rye, sorghum, timothy, velvet bean, wheat, winter oats.

In general it will be found desirable to include several of these crops in a rotation in which a summer legume alternates with a winter grain. In the South, where the nematodes are perhaps the most harmful, the two most successful winter crops are winter rye and winter oats. The following rotation is therefore suggested as a practical one in the majority of instances:

In the fall sow winter rye so early that it can make a good growth before it is necessary to plow the land for the next crop. In the spring turn under the rye as green manure and plant corn. Later place cowpeas of the Iron or Brabham varieties, which are resistant to root-knot, in the drill between the rows. The second fall sow winter grain, preferably oats, and either allow it to ripen or cut it for hay while green. The grain should be followed with Iron or Brabham cowpeas harvested as hay. If a third-year rotation is desired, and it is much safer to use it, winter grain should be sowed, allowed to ripen, and followed with resistant cowpeas for hay. Barley or wheat may be substituted for the oats and rye, and after the first year velvet beans and beggarweeds broadcasted instead of cowpeas.

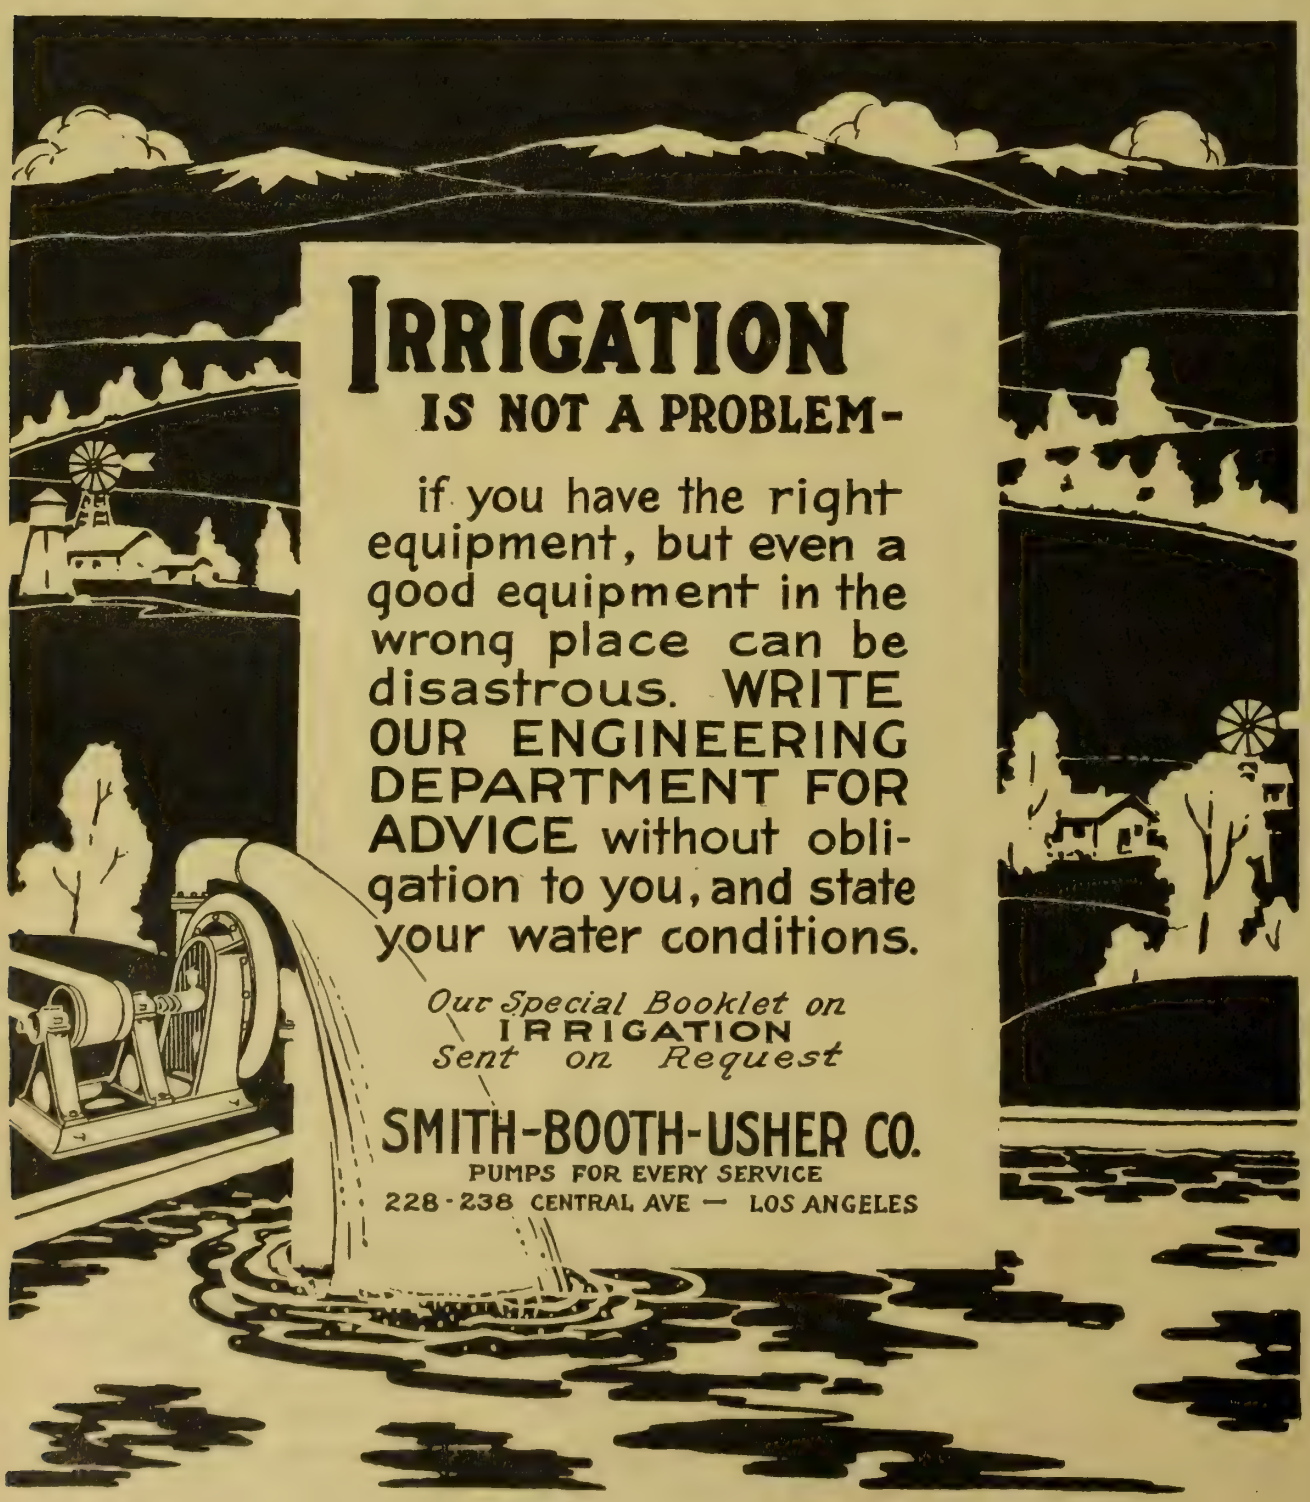
With such a rotation carefully carried out it is possible to control the nematodes. There are however so many ways in which these can be reintroduced that in sections where they are known to be prevalent it is desirable to repeat the rotation every four or five years. If this is done it is well to plant the most susceptible crops immediately after the field has been cleared and to follow these with less susceptible ones until it is time to apply the extermination rotation again.

The presence of root-knot is not always readily apparent. Badly infested plants are dwarfed, wilt readily in hot, dry weather, and are usually a paler green than healthy ones. With less severe attacks, however, these symptoms are not always noticeable, and the reduced yield is not infrequently believed by farmers to be a normal one. Where there is any reason to suspect the existence of root-knot, however, the roots should be examined, and in the case of some tuberous plants like the potato the tubers should be opened and the inside examined to detect the layer of discolored tissue usually found just beneath the skin of diseased plants.

Tubers, nursery stock, and bulbs are common agents for transporting the nematodes from one place to another. In addition, however, this is frequently done by running water and by soil which clings to farm implements, the feet of men, and the hoofs of animals. In heavily infested districts therefore the farmer must be on the lookout to close all these avenues of infection. Seed potatoes should always be selected from fields where a critical inspection shows no evidence of the disease and no parts of diseased roots should be permitted to be mixed in the manure that is to be placed on uninfested land.

Greenhouse conditions are almost ideal for the development of nematodes. The most efficient method of exterminating them is to steam the soil by passing steam into perforated pipes laid at a depth of one foot below the surface of the soil. Where this is impossible the infested soil must be removed, the benches whitewashed with boiling hot whitewash and then refilled with fresh, clean soil. Land that is flooded for a period of from two to six months each year is practically certain to be free from the pest.

Orchards also suffer frequently from root-knot. Unfortunately, however, the eradication of the disease here is more difficult since the extermination of the nematodes by a rotation of immune plants is obviously impossible. Where only two or three trees are found to be infested they should be removed and destroyed and the surrounding soil treated with a solution of formaldehyde at the rate of about two to three gallons per square yard. Occasionally a lavish use of fertilizers and thorough cultivation of the field will aid the plants to outgrow the trouble. The only really safe way however is to make certain that the land is not infested before the trees are planted and then to be equally certain to use only uninfested nursery stock. It is far better in the end to take the time to free the land from the pest than to have the trees remain several years without any appreciable growth, as is too often the case where nematodes are abundant. It is most unwise to plant a very susceptible crop, such as melons, cucumbers or tomatoes in a field that is to be turned into an orchard later.



OLIVE PULP AS FERTILIZER

Mr. E. K. Grant of Wasco writes: "A week or so ago I noticed in your paper where someone had asked about olive pulp as a fertilizer. I am sure that Judge Ross who has an orange orchard north of Glendale experimented along this line several years ago and found it a very poor fertilizer and sometimes injurious. It sure makes a fine fuel for kitchen stoves and heaters if used carefully. Gives out great heat and lasts extra well."

FLORAL EXHIBIT

For years the San Diego Floral Association has held semiannual shows, of course one in the fall for chrysanthemums and other fall bloomers and one in the springtime, though never so early as the show held this year. As a consequence some of our most beautiful spring blooming bulbs have failed to receive the attention they deserve. In order to give opportunity to make an exhibit of daffodils, jonquils and other early bloomers an early show was planned, and it was also planned that it should be one of the

LEFT TO RIGHT, A. D. ROBINSON, EDITOR CALIFORNIA GARDEN; J. R. GORTON AND R. W. SUMNER, BOTH CONNECTED WITH THE STAFF OF LANDSCAPE GARDENING, PANAMA-CALIFORNIA EXPOSITION.

first functions of its kind connected with the Panama-California Exposition. The desired result was accomplished and in the corridors surrounding the California plaza on the grounds thousands of flowers of cultivated bulbs, as well as bulbs from the hillsides of San Diego County, were exhibited.

One striking exhibit was of Watsonias, both pinks and whites, and the wonder was expressed as to how they were scured. We have no answer for it is certainly much earlier than these usually appear.

Another exhibition of flowers is planned by the same organization to be held in connection with the exposition at some later date.

DRY FARMING CONGRESS

The Internation Dry Farming Congress and Soil Products Exposition will be held at Denver, September 27-October 9, utilizing the great Denver Auditorium as the centerpiece and constructing around it on vacant property and streets six or seven temporary buildings properly to house the exposition, not only of agricultural products, but machinery, industrial pursuits, etc. Congress has appropriated $20,000 to make a splendid showing of the work of the department of agriculture, and the legislatures of Kansas, Oklahoma, Nebraska and several other Western states have already acted favorably on direct appropriations for state displays. In many other states, like Arizona, New Mexico, Utah, Wyoming and Montana, existing state agencies will probably take care of the matter. In any event, it is a safe prediction that every state west of the Mississippi River, every one of the four western provinces of Canada, several foreign countries, including Spain, British South Africa and China, will be represented this year at the great exposition at Denver.

The congress offices have been opened in Denver and the campaign is now proceeding from that point with much dispatch.

A TRIP WITH AN ARIZONA COUNTY FARM ADVISER

Following is an account of a recent field trip by A. L. Paschall, farm adviser for Cochise and Santa Cruz Counties of the agricultural extension service, University of Arizona college of agriculture and United States department of agriculture. This will give some idea of how a farm adviser works:

"I left my headquarters at San Simon at 2:00 p. m. On arriving at Benson, 82 miles away, a consultation was held with the principal of the Benson high school regarding the planning of the school garden; the school grounds were then inspected. The forenoon of the next day a field demonstration in garden work and fruit tree pruning was held at the home of Mr. W. G. Goodman at St. David, seven miles from Benson. This was done on a few hours' notice. Ten farmers were present. That afternoon a farmers' meeting was held in the St. David church. Twenty-four people were present. After the meeting four farms were visited, questions answered and information regarding tree grafting, pruning, pasture crops, hog raising and garden culture were given. I spent the night with a farmer, Mr. T. H. McKinney.

"During the next forenoon some homes in the town of Benson were visited in company with Mr. Davis and several visitors, and information was given concerning vegetables for the backyard, and how to care for lawns, small fruits, flowers, trees and shrubbery. That afternoon a farm about 2½ miles away was visited; the owner of this farm sent his son around to his neighbors and in a short time a crowd of 24 farmers had gathered together for a field demonstration in gardening methods, tree pruning, etc. The following subjects were discussed: Kinds of fruits to plant—time and distance to plant; how to head back a young fruit tree; the proper way and time to prune fruit trees; orchard cultivation and cover crops; small fruit culture; the significance of "living at home;" the home garden—especially potato culture; farm crops and rotation; seed selection and breeding; cooperation.

"These subjects were discussed in a practical way from the standpoint of immmediate needs. They will be taken up more in detail in the future. The farmers displayed much interest and asked many questions.

"In the forenoon of the following day three and a half hours were spent at the Benson high school in laying out the school garden, specifying what vegetables to plant, how and when to plant, etc. A talk was next given to 55 boys and girls and four teachers of the high school on the subjects of beautifying the home grounds and home garden and orchard; tree planting; farm accounts and club work. Much interest was manifested and many questions were asked. After the indoor discussion a field meeting was held in the school orchard and garden. Following this, upon request, a visit was made to the home of one of the teachers and advice was given concerning fertilizing, preparing and planting garden, planting trees and shrubbery, demonstration in pruning a few fruit trees, etc.

"While waiting at the railway station for a belated train, five farmers came in to discuss their problems and obtain information about potato culture, dry-farm crops, seed selection, eradication of corn smut, sowing of small grains and how to treat same to prevent smut.

"On the return trip to San Simon the train stopped for 10 minutes at Bowie. There were on hand several farmers who wanted information concerning potato culture, garden preparation and orchard care. And one man requested some instruction in fruit-tree pruning.

"This was my second visit to the Benson region. During my first visit the farmers did not show as much interest. They did not understand the exact nature and object of the work and what I was trying to accomplish. Their appreciation of and interest in this work are rapidly increasing.

"The total cost of this three days' trip, including salary and expenses, was $25.70."

The advice and assistance given by Mr. Paschall on this one trip alone may easily be worth hundreds and even thousands of dollars to those who were fortunate enough to be present. It has been very truly said that a "farm adviser works two eight-hour days every day." From the number of requests which are coming in for Mr. Paschall's services it is evident that he will be extremely busy. He may be reached by letter at San Simon, Arizona.

PLANTERS Now is the time for you to Order Nursery Stock-Buy the Best

Citrus Trees and Olives

The best trees are always cheapest in the long run

OUR SPLENDID STOCK OF ORANGES, LEMONS, POMELOS AND AVOCADOS—in all the leading varieties, should be investigated before placing your order. It makes no difference how few or how many trees you may wish to buy, we can supply you with the choicest quality stock and at prices that will certainly prove tempting.

ASK FOR OUR "BULLETIN ON THE OLIVE" GIVING VALUABLE INFORMATION that should be in the hands of every planter. We specialize on the growing of fine olive trees and have an exceptionally choice assortment of Mission, Manzanillo and other varieties. Olives are coming into their own and if you contemplate planting, it is particularly necessary that you should plant the varieties which are going to prove the most profitable at the time your trees come into bearing.

Every Tree Guaranteed

For over thirty years the Roeding policy has been to sell only trees that we would be willing to plant ourselves and you can rest absolutely assured that every tree you buy from us will be of first quality and packed so as to reach you in first class condition. We guarantee all stock to be true to name and take a real pride in the quality of our stock.
In addition to citrus trees and olives, we can supply a very large assortment of deciduous fruit trees, as well as evergreen and ornamental trees, vines, shrubs and plants.. Ask for a copy of our complete catalogue.

"ROEDING'S PRACTICAL PLANTERS GUIDE" —— SENT FREE

This book is the result of Mr. George C. Roeding's more than 30 years' experience in California horticulture. It tells how and when and what to plant. Also gives detailed information illustrated with photographs on PRUNING.
If you send us your list for prices and suggestions, we will send you a copy free—otherwise the price is 25c. Write us today.

Roeding & Wood Nursery Co. Inc.

Small Fruits Vegetables

THIS MONTH IN THE SACRAMENTO VALLEY

Written for the California Cultivator
By S. S. Rogers

ALL vegetable gardens come under one of three types, namely: truck, home, and market gardens.

In speaking of truck gardens it is generally understood that these are located quite a long distance from the selling point, making it necessary to haul the vegetables by rail or boat into the market, rather than by the use of wagons. Under this heading would also come ranches of those who are specializing upon relatively few vegetables but are growing large quantities of each. This type of gardening is found commonly throughout the entire United States and is a large factor in the production of vegetables. These gardens are generally located within ten to forty miles of the largest cities in the United States; although on account of especially favorable local conditions they may be located several hundred miles from the largest cities. Where such is the case, the vegetables are generally shipped by carload lots to the markets. An example of this kind of gardening is well illustrated in the potato district known as the Delta, in which from 40,000 to 50,000 acres of potatoes are annually produced and are sold throughout the United States.

Of the three types of gardening, the truck gardens comprise much more land than the other two types. The truck grower will often plant from forty to several hundred acres of vegetables. The net profits from these gardens average between $50 and $200 per acre, depending upon location, choice of crops, etc.

The term, market garden, is generally applied to gardens which are producing large assortments of vegetables, located within hauling distance of the markets. These gardens are very important and the land is farmed intensively. The market gardens are found in the immediate vicinity of the largest cities of the United States and generally utilize a rather small amount of land, ranging from five to forty acres.

The profits from a well run market garden are much larger per acre than when truck gardening is practiced. When this type of gardening is carried on under favorable conditions the returns per acre are generally larger than when any other crop is grown.

Home gardening is the raising of vegetables for home use From an economic standpoint this manner of of gardening is of little importance, and in fact many vegetables are raised in a home garden at a higher cost than they could be purchased for; but when this form of gardening is used, the cost of production is generally not considered. These gardens are located throughout the United States wherever vegetables can be grown, and are to be found in the back yards in the cities and towns. The area devoted to this kind of gardening is generally very small; in most places raising only enough vegetables for home consumption with probably a few to sell or give away to the neighbors.

During this month the garden should be well planted, for in many sections of the Sacramento Valley the climatic conditions are favorable for planting of nearly all of the common garden vegetables. Such crops as beans, melons, cucumbers, summer squash, tomatoes, corn, etc., should be planted this month. If beets and turnips are planted immediately they can be harvested from June until August inclusive. Carrots can be planted immediately and can be harvested during the summer and fall.

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

In gardening operations this month is the most critical time of the year. Delayed plantings should be rushed in at once. On crops already planted weeds should be kept cleaned out and the soil put in preparation for the hot weather soon to come. The ground should be given thorough cultivation and all crops planted or to be planted should be well mulched to insure retention of moisture. Cultivation should follow each shower as soon as the ground is dry enough. All the hardier plants as well as the more tender ones should be put in. However, for cucumbers, melons, okra, roselle and squash there need be no immediate hurry though they may safely be planted during April. If the weather continues favorable, lima beans may be planted the latter part of the month but should cold, damp weather prevail, it would be better to delay planting until the ground becomes warm.

All early varieties of corn may be planted. We would especially recommend the early sugar corn for family use. The planting of field corn can be delayed until the last of the month or during the following month, but the soil should be put in shape at once so as to retain all possible moisture. Tomatoes, egg plants and sweet potatoes can now be planted out. If the ground is in good condition before planting is done a few cups of water around each plant to settle the ground will be all the watering they will require for two or three weeks. It is better to give them a little water in this manner than to keep them wet continually, for this keeps the ground cold and prevents their best development.

The tepary and black eye beans will prove prominent crops the coming year as the demand has practically cleaned up all the available supply, and should the European trouble continue these will be one of the most profitable general crops grown. In localities where beans may be grown to advantage we would recommend large plantings, especially of limas and navies.

Now is the time to plant onions for fall crop. For a good keeping or storing onion the best is the Australian Brown, while closely following in popularity is the Danver. On account of their keeping qualities these are far superior to the whites, which are poor keepers.

A plant that is rapidly becoming known throughout Southern California is the roselle or lemonade plant. Fruit of this plant makes a superb jelly or sauce for the table, and is used in the tropics crushed and made into a sort of lemonade, or cooling drink. Roselle should not be planted too early, but if the weather is favorable the sooner planted the sooner will the crop mature in the late summer. The seed should be planted where they are to remain as they do not bear transplanting. The roselle is grown much the same as corn and beans, planting the seeds in rows in hills about one foot apart, two or three seeds to the hill.

Those having good celery land should not fail to plant a good supply of celery at this time. The plants will be ready for transplanting in June for a fall crop.

"WINTER RHUBARB, CULTURE and MARKETING"

By

Reginald Bland

A complete manual of field culture for this valuable crop, filling an important vacancy in Agricultural Literature. Chapter titles are: **Rhubarb and Winter Rhubarb, Selection of the Location, Preparation for Planting, Planting, Culture, Picking and Packing, Marketing, Propagation and Development.**

This new book will be useful to successful growers; **Invaluable** to beginners, to prospective planters and to those who may have been unsuccessful; Interesting and Instructive to all.

The strenuous pioneering years are over. Recent developments have brought new life and impetus to rhubarb culture. One company, shipping from 200 to 250 cars annually (over 90 per cent of the total California production), says, "We now have more customers on our books than we have rhubarb"—and only a few of the big eastern markets have been supplied. Every one who wishes to profit by this great opportunity should have the sound, practical instruction and advice to be found in

"Winter Rhubarb, Culture and Marketing"

In cloth 50c; in paper, 25c; postpaid.

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

ALL manner of gardening operations are in order in the flower garden. Everything in both the tender and hardy flowering plants should be rushed in at once.

Hanging baskets should be renewed, either putting in new plants or dividing the old ones and supplying rich new soil. This will insure good results for the balance of the year.

Dahlias and gladiolus and the tuberous begonias should be planted.

Transplant asters, plants that are strong enough or, if no seed of this popular fall flower has been sown, it is not yet too late.

For a hardy bedding plant would suggest the portulaca, or moss rose, for covering bare spots during the hot summer months. This requires considerable heat to come into perfection and grows only during the summer, being strictly an annual, but it is well worth growing for its mass of flowers during the hot summer months.

All manner of flower seeds may be planted, either perennials or annuals. The sooner they are in the better they will be established before the hot weather comes on. Do not fail to try the new annual Sweet William. Seed planted during this month will come into bloom during July. These flowers are far superior to the old type of Sweet William.

Sufficient appreciation has not been shown the Margaret carnation. The seed is inexpensive and one may count on a big bed for cutting within four months from planting. It is advisable to plant the seed in a small bed and transplant, but with light soil satisfactory results may be obtained by planting in permanent location. These make great masses of flowers and while not quite as large as the florist's carnation, they are quite as beautiful.

THE DAMPING-OFF DISEASE

Damping-off is a disease of young seedlings and may be caused by any one of several species of fungi. It occurs mostly in the seed bed, where plants are growing in a crowded condition. It is rarely found in the open field. It is also a common disease in greenhouses, where a relatively high humidity is maintained and where the plants are protected from sunshine and free circulation of the air. The disease usually attacks the seedlings on the stem at the surface of the soil soon after it comes through the ground. It soon girdles the stem and destroys the epidermis. The plant topples over and dies.

Preventive rather than curative measures should be employed for this disease. If damping-off has occurred before, the soil should not be used again, or if used should be sterilized. Any method that will prevent the accumulation of too much moisture in the surface soil and reduce the relative humidity of the air about the plants is advantageous in preventing damping-off. This can be accomplished by practicing the following suggestions: (1) the upper layer of soil should be frequently stirred; (2) a free circulation of air about the plants and exposure to sunshine should be permitted; (3) the plants should be watered in the morning in preference to the late afternoon or evening; and (4) a layer of fine, heated sand should be sprinkled over the surface of the soil. —The Market Growers' Journal.

THE DAHLIA

By A. D. Robinson in California Garden

The season has been generally favorable to late blooming of the dahlia, and where early plantings were cut right back in August the second crop of flowers is now at its best. Experience seems to point to early planting of dahlias, May for preference, or even mid April, with a cutting back to the ground of part of the crop by sections two weeks apart, beginning about August 1, to insure continuous and late blooms. Be sure to mark your tubers if you intend to dig them. There does not seem to be any substantial benefit in lifting the tubers unless they are to be moved or blooming season is to be controlled by time of planting. The seedlings and rooted cuttings are safest left undisturbed, as the tubers being small, they are likely to dry out entirely if lifted. Something of course depends on the soil as stiff, cold clay might cause rot in the wet season. Returning to marking, use tags with copper wire and attach these right at the base of the stalk. Write on the tag the name, if you know it, but especially color and habit of growth, so that you have the necessary data for planting next year. Thus "Mr. Geo. Stevenson, Cactus, yellow, medium" or "Gustave Doazon, Dec. Red, Orange, large" (referring to plant not blossom.)

Don't be in a hurry to cut off your dahlia stalks. If done before the tubers cease activity, it will only stimulate new growth, which will weaken the tuber. Wait until the tops show a tendency to yellow and dry up. This will probably not be before December.

A NATIONAL ROSE GARDEN

The American Rose Society last spring completed arrangements to cooperate with the United States department of agriculture in establishing a rose garden at the nation's capital. This garden is to contain as complete a collection of roses as will grow out of doors in this section of America. The society is furnishing the roses, while the department has set aside two acres of ground at its Arlington farm for the garden. This garden already contains about 320 varieties of roses, but there are many hundred kinds not yet included, and eventually the site can accommodate as many as 2,000 varieties if they can be secured.

Any grower of roses who thinks he may have roses not already in the national collection has been invited by the American Rose Society to contribute a specimen plant. Correspondence concerning such plants should be sent to Mr. Alexander Cumming, Jr., of Cromwell, Connecticut, who is chairman of the society's committee on gardens. A list of varieties already grown and a plan of the garden will be sent to those interested on application to the department of agriculture.

An Overproduction of Apples ?

The present demand for apples in the United States, including those used for export, is placed by the Department of Agriculture at 55,000,000 barrels. If that many apples were raised in this country there would be no overproduction. Figures from the Department of Agriculture show there has been an average annual decrease of 25 per cent in the apple production during the last nine years. The serious shortage that exists for apples is attributed largely to the dying out of the old orchards and the insufficient plantings of new ones.

The Yucaipa Valley, eight miles from Redlands, altitude 2400 to 3000 feet, is the place to plant an apple orchard, and this is the time of year to visit Yucaipa and see what you would have if you had planted four years ago. It is not too late to make a start.

Come to Redlands and let us take you to Yucaipa and show you our five, ten and twenty acre tracts at $285 per acre, on very easy terms. One share of stock in a Mutual Water Company with each acre.

Redlands & Yucaipa Land Co.

DIKE & LOGIE, General Sales Agents

209 Orange Street **REDLANDS, CAL.**

I Want to Show You This 40 ACRE EQUIPPED FARM

LAND: Level, clean, strong; no brush or stumps; ready for plowing; between two railroads and within 1½ miles of stations on Southern Pacific and Western Pacific. In the Upper Sacramento Valley.
SOIL: Deep San Joaquin loam.
WATER: Unlimited water at 20 to 25 feet.
EQUIPPED: with a plow, a harrow and a cultivator, a pumping plant complete, trees and seed.
SPECIAL: This land is absolutely above all flood from rivers; the titles are clear and guaranteed; there is no bonded indebtedness; there are no reclamation or irrigation assessments. This is clean, strong land without incumbrance of any kind.
THE PRICE is $150.00 per acre with equipment, or $125.00 for the bare land. Terms, ¼ cash, balance 6 equal annual payments, 6%. I want to show you this specially selected piece of land.

OUR CO-OPERATIVE BUYING SERVICE

Will enable you to get any acreage, in certain selected tracts, at strictly wholesale values. You should know about this—write today.

The farm bureau has taken up a campaign for the county-wide control of hog cholera and of the red spider. A Hog Raisers' Association, for the cooperative control of hog cholera, is being organized. The disease has become alarmingly prevalent at this early date, and a strong organization is promised.

The almond and prune sections suffered heavy loss from red spider attack last year, and it is proposed to make an educational campaign, and to follow this with farm bureau agents, who will go from orchard to orchard, giving warning of initial infestation.

AVOCADOS

Bring $40 to $50 a Box In Los Angeles

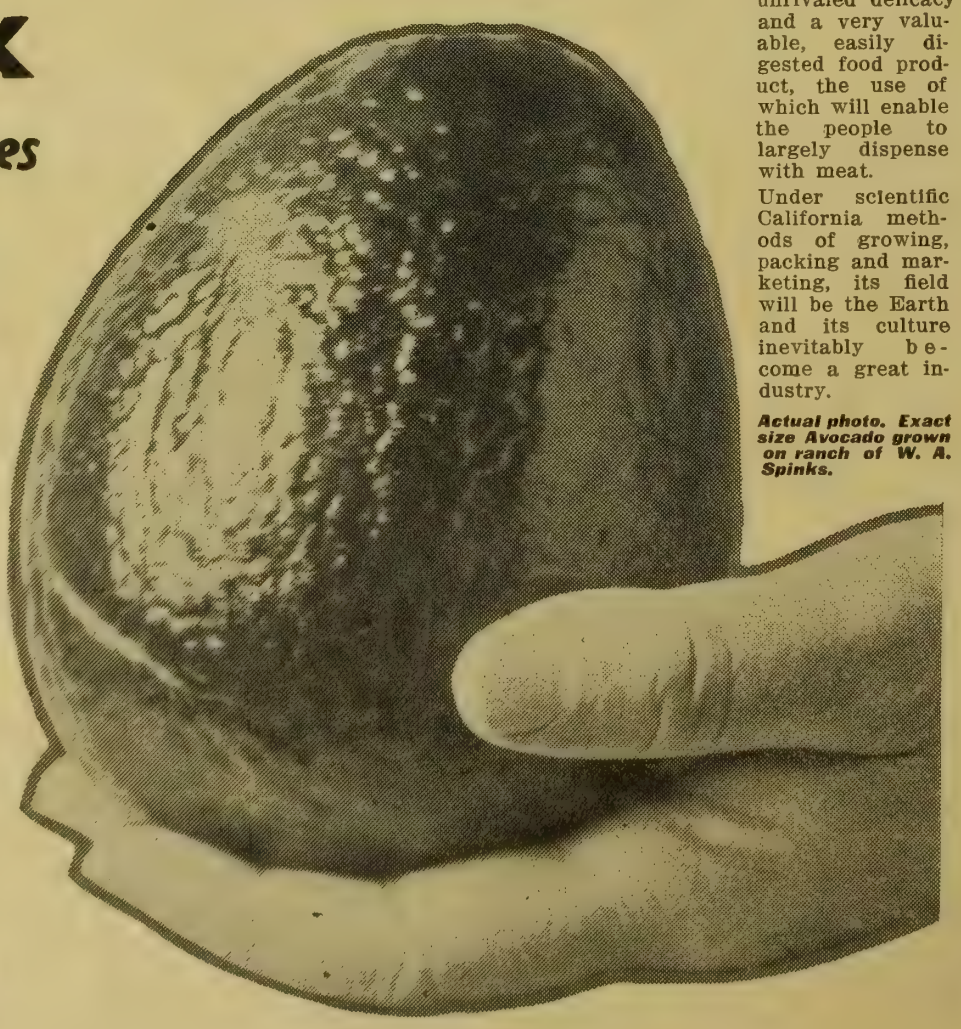
—the great future fruit industry of California—

FACTS YOU OUGHT TO KNOW

Avocados will grow and thrive in California. Properly selected varieties will stand more cold than oranges, require no more water nor general care, do not so readily harbor pests, make nearly twice the growth per year, eventually produce several times the number of fruits per tree, and make most beautiful ornamental trees. The fruits grown in California are entirely superior in richness and flavor to those grown in the Tropics, and find ready sale at fabulous prices.

The Avocado is the most important fruit in the world, being at once an unrivaled delicacy and a very valuable, easily digested food product, the use of which will enable the people to largely dispense with meat.

Under scientific California methods of growing, packing and marketing, its field will be the Earth and its culture inevitably become a great industry.



Actual photo. Exact size Avocado grown on ranch of W. A. Spinks.

"As to the value of the Avocado fruit, no one on earth can question that. It is the most nutritious, easily digestible and delicious of all fruits and if it can be purchased in quantity will sooner or later be eaten by everybody everywhere."— Luther Burbank. Extract from letter of Feb. 20, 1915.

Vigorous field grown trees, 2-year-olds from the bud—of rapid-growing, cold resistant and prolific variety 1¼ inches in diameter or larger, $2.00 each. Will bear fruit in from two to three years. Lower prices on quantities. Take advantage of the times and buy at these low prices. Write for complete literature.

Keep this ad in your scrap book and look at it in ten years from now.

Boys high school clubs have been organized at Willow, Orland and at Princeton. The Princeton club is in Colusa County, though it draws largely from Glenn County in attendance.

The schedule is arranged to permit Wednesday of each week for the closing of center work in the various districts, for boys' clubs and special work. Saturday of each week is set aside for reports, routine work, directors' meetings and special trips.

The work in the county is as yet in its organization stages.

SAN DIEGO FARM BUREAU ANNUAL

In California there are 13 farm bureaus, which means that the farmers in 13 counties have organized themselves to advance their own interests and to aid in the work of the farm adviser. Of these 13 counties 11 have farm advisers installed. A farm bureau consists of representatives sent from farm "centers" or "locals" as they are sometimes called. The farm adviser's appointment is made by the state university and it is made possible through the Smith-Lever bill and through funds furnished by the state university and by the county. One of the first demands made by the state university before its funds can be used to aid in this work is that at least 20 per cent of the farmers of any county shall be organized into farm centers and a farm bureau.

One of the first counties in California to organize was San Diego, and the second annual meeting of its farm bureau was held in front of the big organ on the Panama California exposition grounds at San Diego on the 20th. The first farm adviser of that county was Mr. James A. Armstrong, but owing to his having been called to work along similar lines in Arizona his San Diego County work has been taken up by former County Horticultural Commissioner H. A. Weinland. From Mr. Weinland's report made at this annual meeting we learn that there are 528 members of the bureau in that county. Each of these members pays dues at the rate of one dollar, or rather the dues amount to 75 cents, and 25 cents is paid for a subscription to the official organ of the bureau. This bureau begins the new year's work with a balance in the treasury of $237.

SAN DIEGO COUNTY FARM BUREAU ON EXPOSITION GROUNDS. COUNTING THE VOTE AT ANNUAL ELECTION.

J. W. SHERWOOD, W. A. DORAN, J. A. CAMPBELL, THE NEW PRESIDENT; J. A. CAMPBELL, MRS. J. R. BLAKISTON, MR. BLAKISTON.

One of the first events of this annual meeting was the hearty endorsement given to former Adviser Armstrong for the excellent work done while located in San Diego County. Addresses and reports were made by retiring officers. The new officers elected were: J. A. Campbell, president; J. R. Blakiston, vice-president; Messrs. Doran, Culbertson, Bland and Edwards, directors.

Of course Prof. B. H. Crocheron was present and made a most admirable address touching upon the work, not only in San Diego County, but referred to the fact that better work and more satisfactory marketing conditions had been secured by the cooperation of farmers in these farm bureaus, this in addition to any benefit which may be secured through the work of the farm adviser. In fact, he wished it understood that the work of the farm bureau and the farm adviser were distinct, though best results were secured through their working together. The farm bureau has nothing whatever to do with the government, while the farm adviser is directly connected with the United States department of agriculture. Much good work is being accomplished by farm bureaus where there is yet no farm adviser. Even where there is a regularly established adviser the bureau has larger powers and opportunity for more immediate financial advantage for its members. For instance, the farm adviser is prevented from acting as agent or in any way conducting business operations for the farmers. He may secure and disseminate information, but the direct handling of the products of the farm or supplies which farmers may wish to purchase is out of his jurisdiction because of his connection with the federal service. The adviser must make report in duplicate each week to his state leader at Berkeley, and one of these reports is at once forwarded to Washington so that every adviser in the various counties of California has a weekly report filed for permanent reference in its proper place in Washington.

Leader Crocheron referred to many incidents in California where material benefit had been secured through the farm bureau organization and through farm adviser work. For instance, in Humboldt County the planning of irrigation systems or drainage systems, the purchasing of pure bred stock, the securing of lime much needed by the soil in that section, and other features were referred to. In Yolo County cow testing associations have been organized which have greatly increased the earning power of many districts. In Ventura County a squirrel killing campaign has been one of the principal features of the farm bureau work. Two other lines of activity in the same county have been the encouraging of more general swine husbandry in certain sections and of bud selection and more productive orchards in others. In Kern County the efforts of the farm bureau have been directed toward the organization of creameries and cooperative marketing concerns and the encouraging of local fairs. Perhaps the most beneficial work of all has been along the cooperative marketing line. The same problems which are being threshed out by these bureaus in California are being worked out in practically every other state in the Union. This matter of affiliation with other organizations is an inspiring feature of farm bureau work.

Rides Like The Car Wheels On Steel Rails

That's the plan of construction in the "Creeping Grip" tractor. It lays and carries its steel track. It rides smoothly, creeping over the soil with a firm grip. It loses no power in slippage—it never packs the soil—saves money in fuel bills because of the greater power delivered—at the draw bar. Here's the tractor that cuts the cost of plowing and gets crops in on time. The

"Creeping Grip" Tractor

can enter soft fields in early spring when other tractors must lie idle waiting for wet spots to dry. By comparison the creepers are lighter on the soil than an empty wagon. They climb and oscillate over obstructions, carrying the machine on a center axle. Two points of contact rest on the ground, thus avoiding jolts on the machine. The frame rides on 3 points of suspension, which eliminates binding on bearings—upkeep cost is reduced to a minimum.

Write for Catalog

Prices, $1100.00 and up

Creeping Grip tractors have been tested and are now in use in all parts of the South and West. Let us tell you how you can save money with one on your farm.

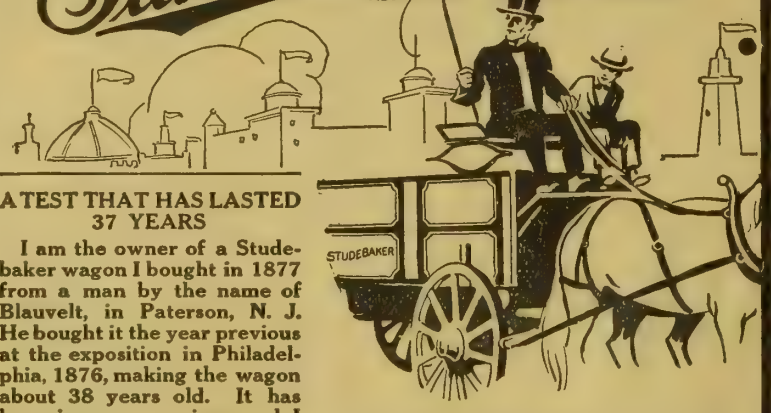
Studebaker

WAGONS BUGGIES HARNESS



A TEST THAT HAS LASTED 37 YEARS

I am the owner of a Studebaker wagon I bought in 1877 from a man by the name of Blauvelt, in Paterson, N. J. He bought it the year previous at the exposition in Philadelphia, 1876, making the wagon about 38 years old. It has been in use ever since and I am using it now.

Henry DeRonde,
Spring Valley, N. Y.

His Studebaker came from the "Centennial," at Philadelphia in 1876

AWAY back in 1876—the year of the "Centennial" in Philadelphia—Dealer Blauvelt of Paterson, N. J., bought a Studebaker Farm Wagon there and sold it, a year later, to Henry DeRonde of Spring Valley, N. Y.

The wagon has been in constant use ever since, and is in use now—a long term of service for a wagon.

But Mr. DeRonde's wagon is a Studebaker, and long-lived Studebaker Wagons are found all over the United States.

Built for lasting service

You see, it is the way the Studebaker is built that makes it last so long. Air-dried wood, tested iron and steel, good paint and varnish, all count.

But the main fact is that Studebaker has been building wagons for 63 years and knows how.

Studebaker could not afford to build a cheap wagon. The motto of the house for six decades has been: *build not the cheapest, but the best.*

Any wagon salesman will tell you that a Studebaker wagon is built to last. And long after an ordinary wagon has been sent to the scrap heap a Studebaker keeps right on doing its work and earning money for its owner.

Suppose it does cost a few dollars more, isn't the increased life of a Studebaker worth it?

Studebaker Buggies and Harness are also built to outlast others.

National Oil Engine

An engine which will burn fuel costing three cents per gallon, and at the same time is an engine with 90 per cent less parts, is the engine for the rancher to buy.

A LETTER FROM A USER OF THE NATIONAL OIL ENGINE

Kingsburg, Cal., Dec. 19, 1913.

National Steam Pump Co.,
Los Angeles, Cal.

Gentlemen:

I bought the first NATIONAL Oil Engine sold in this State. Any one wanting an engine let them come and see my 15 H. P. pulling a 6-in. centrifugal pump lifting thirty feet throwing two cubic feet moving one foot per second, using low grade fuel. I will answer any letter.

Truly yours,
(Signed) L. E. HURLEY.

We guarantee the saving in fuel expense and purchaser's own judgment will tell him that in doing away with 90 per cent of the small, delicate and complicated parts, springs, gears, etc., that he is getting away from engine trouble when he invests in a National. 1915 catalog now ready.

General Agriculture

NO SHORTAGE OF FOODSTUFFS LIKELY

THE 1914 wheat crop of the United States was estimated to be 891,000,000 bushels. The estimated surplus carried over from the 1913 crop was about 76,000,000 bushels. There was, therefore, a total available supply of 967,000,000 bushels. As the normal annual per capita consumption of wheat in the United States is about 5.3 bushels, 520,000,000 bushels should meet our normal domestic requirements for food; in addition, 90,000,000 bushels are required annually for seeding. Six hundred and ten million bushels, therefore, should supply the normal domestic demand. This would leave a surplus of 357,000,000 bushels. Of this surplus, about 210,000,000 bushels were exported by January 30. This left 147,000,000 bushels, or 40,000,000 bushels more than our average annual export for the past five years, for export between February 1 and the appearance of the new crop, or for carrying over into the next crop year. The amount is sufficient to permit the export of nearly 1,000,000 bushels a day until July 1, before which time the new crop will begin to be available. This is about the average recent exportation.

The large demand for our wheat arises from the fact that there was an estimated world's shortage of over 400,000,000 bushels outside of the United States, from the fact that the Russian exportable surplus of 100,000,000 bushels is not available generally, and from the fact that the belligerent nations are eager to secure food supplies. If it were not for these things, we should be discussing ways and means of disposing of our tremendous surplus of food products.

As has been stated, the new American crop will begin to appear before July. The Argentine crop is now coming on the market. It is estimated that from that source there will be available 100,000,000 bushels. A surplus of 75,000,000 bushels or more from India will be available in May and June. The increase in the fall-sown wheat acreage of the United States in 1914 was 11.1 per cent, or over 4,000,000 acres; in the northern hemisphere generally the acreage of winter wheat shows an increase of from 3 to 33 per cent, as follows: Denmark, 3 per cent; Italy, 5 per cent; Switzerland, 10 per cent; United Kingdom, 10 per cent; United States, 11 per cent; India, 22 per cent; Canada, 33 per cent.

But suppose a shortage in wheat should develop in the next three months, what would be the situation? There is a great surplus in other food crops in the United States, a number of which can be used as substitutes. Wheat does not constitute more than 12 per cent of the normal diet, about the same as poultry and eggs. Meat and dairy products constitute 48 per cent; vegetables, 11 per cent; fruits, nuts, sugar, fish, and other items the remaining 19 per cent. There are larger supplies of corn and other grains, meat animals, dairy products, potatoes, and fruit at the opening of 1915 than for many years. The most important competing products are corn and potatoes. This is shown by the fact that while the normal consumption of wheat is 5.3 bushels, in Maine it is only 4.7 bushels and in Michigan 5. In the wheat-growing states, where wheat is abundant, such as Minnesota, the average is 7.2, whereas in the South, where corn is much used, the average is 4 bushels. Normally about 3 per cent of the corn crop is consumed as food. Of our total crop about 80,000,000 bushels would be used for food, the remainder for other purposes. The remainder could be used for foods and substitutes used for animals. The potato production in the United States averages 3.8 bushels per capita. This year the available supply is 4.1 bushels. The average price of meat animals was 7 per cent cheaper in January than a year ago, butter 2 per cent lower, the price of chickens slightly lower, of potatoes 35 per cent lower, and of apples it was 37 per cent lower.

It would seem that the United States is not likely to be threatened with a shortage of foodstuffs.—United States Department of Agriculture.

BIRDS, BENEFICIAL AND INJURIOUS

Whether a bird is beneficial or injurious depends almost entirely on what it eats. In the case of species which are very abundant or which feed to some extent on the crops of the farmer, the question of their average diet becomes one of supreme importance, and only by stomach examination can it be satisfactorily solved. Field observations are at best but fragmentary and inconclusive and lead to no final results. Birds are often accused of eating this or that product of cultivation, when an examination of the stomachs shows the accusation to be unfounded. Accordingly the biological survey has conducted for some years past a systematic investigation of the food of those species which are most common about the farm and garden.

Within certain limits birds eat the kind of food that is most accessible, especially when their natural food is scarce or wanting. Thus they sometimes injure the crops of the farmer who has unintentionally destroyed their natural food in his improvement of swamp or pasture. Most of the damage done by birds and complained of by farmers and fruit growers arises from this very cause. The berry-bearing shrubs and seed-bearing weeds have been cleared away, and the birds have no recourse but to attack the cultivated grain or fruit which have replaced their natural food supply. The great majority of land birds subsist upon insects during the period of nesting and moulting, and also feed their young upon them during the first few weeks. Many species live almost entirely upon insects, taking vegetable food only when other subsistence fails. It is thus evident that in the course of a year birds destroy an incalculable number of insects, and it is difficult to overestimate the value of their services in restraining the great tide of insect life.

Bees and Their Care

BEE KEEPING IN MONTEREY COUNTY

Written for California Cultivator
By William Hackman

Most of our beekeepers are looking orward to a very profitable season or 1915. There will be a lot of peole here to attend the great show and ney will consume a vast output of alifornia's greatest of all nectars hich is made by the busy little oney bee. Our beekeepers should rive to make everything worth while r the bees in 1915. The loss thus ar through the winter has amounted to very little, either by draft or isease, as the winter has been very ild. The manzanita is now in full loom in nearly every nook where is in any way sheltered from the old winds, and the bees seem to ork upon this quite freely during ie warm part of the day. It is certainly one of the greatest helps the eekeeper has, as nothing stimulates rood rearing more than this first nectar of the season from the manzanita. ext for pollen comes the wild mustard, closely following the blossoming of the manzanita. Then about ie first of April the sage begins to oom out very full and the little oney bee goes right into general usiness for all he's worth.

INTERNATIONAL CONGRESS OF BEEKEEPERS

At the December convention of the alifornia Beekeepers' Association at os Angeles it was decided to hold ie next state convention in San rancisco this fall at such time as ay be decided on by the executive ommittee. That committee this ear is as follows: Harry K. Hill, hairman, Willows, Glenn County; W. . Allen, Ventura County; J. G. Gilrap, Ceres, Stanislaus County. The llowing are ex-officio members of ie executive committee. Prof. Willis ynch, president of state association, tockton; A. B. Shaffner, secretary, os Angeles.

Our committee has conceived the lea of making that convention an nternational congress of beekeepers. his seems to be the only reasonable onclusion, in view of the great Paama-Pacific Exposition in San Franisco to last from February till Deember; and also the Panama-Californ ia Exposition at San Diego, this year. There has never been a more opportune time for a beekeepers' congress of the world. Our committee is busy considering and planning on the best convention ever held, and the time is not yet definitely settled; but it will occur in September or early October.

We make this early introductory announcement to the beekeepers of the world, of every land and clime, of every nation and people, to arrange to meet with us, and to help us in the preparation of a program that has never been equaled.

We want the name of every prominent beekeeper of all countries who will be likely to attend the exposition and who might be induced to take part in a five-day program. We urge early action, that we may make all proper arrangements; and we ask all beekeeping journals to copy this call.

Address all communications to A. B. Shaffner, 4232 W. First Street, Los Angeles, or to the chairman of the executive committee, J. G. Gilstrap, Ceres, California.—J. D. Bixby, in Western Honey Bee.

SIZE OF BEES

Some time ago not a little was said as to getting bees of larger size, in the hope of getting larger crops of honey. Some, however, were of the opinion that increased size does not necessarily mean increased crops. Prof. Graf (Prak. Wegweiser) says that, just as it happens among men, that men under size often accomplish the most, so it is among bees. He has been breeding from the best, and it so happens that his best bees are under the average in size.

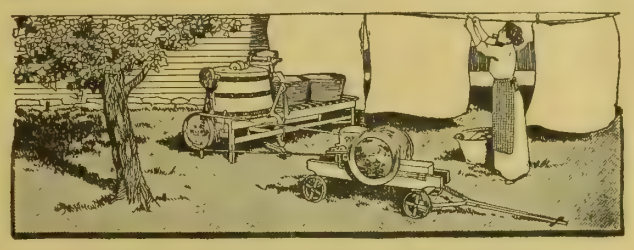
John Deere Farm Implements

John Deere Implements



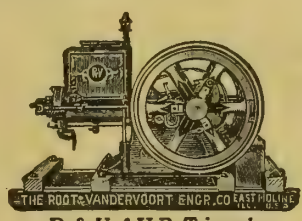
R. & V. Gasolene Engines

New Triumph One Horse Engine. Just the engine for light work about house and barn, such as running washing machine, pumping water and operating other small machines. Saves every member of the family work and worry.

A reliable, efficient, low priced but high grade engine. Easy to start, smooth running, requires no attention when in operation, economical in use of fuel and perfectly safe in and around buildings. All working parts are back of the fly wheel out of the way—a neat outfit in every respect.

R. & V. Triumph Engines for All Farm Machinery

The R. & V. Triumph line of engines is also made in 2, 4, 6, 8, 10, 12 and 16 H.P. sizes, stationary and portable. Every farm can use one or more of these engines to advantage.

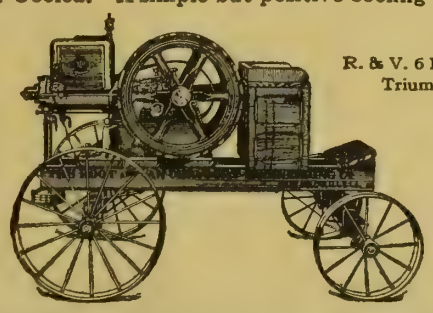


R. & V. 4 H.P. Triumph

They are dependable gasolene engines—always develop rated horse power.

An extra ring over the piston pin prevents scoring and ruining cylinder. This is an unusual precaution for lengthening the life of a gasolene engine. This careful attention to details is followed in constructing every part of the R. & V. Triumph.

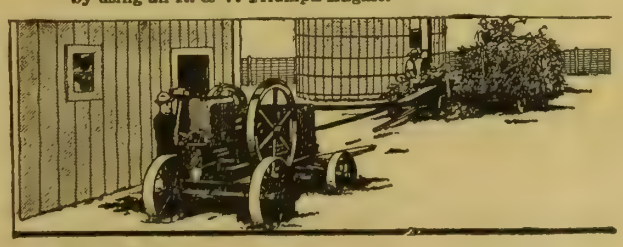
Hopper Cooled. A simple but positive cooling system.



R. & V. 6 H. P. Triumph

The gasolene tank for every R. & V. Triumph Engine is most conveniently and safely located—on practically all of the stationary engines it is in the sub-base.

Write for free booklet "Letting Gasolene Do It." This book tells how you can save time every day in the week by using an R. & V. Triumph Engine.



John Deere Wheel Plows
With Quick Detachable Shares

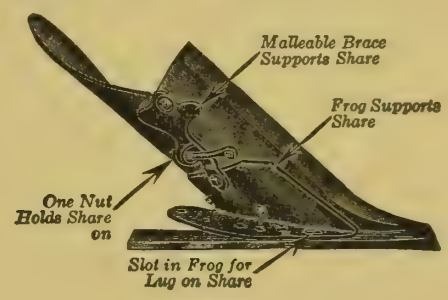
John Deere Wheel Plows, known the country over as "Quality Plows" are now fitted with John Deere Quick Detachable Shares—an exclusive John Deere feature.

These shares are popular with farmers—they make hard work easy.

Superior Features
Unscrew One Nut—That's All

Unscrew one nut and the share comes off—slip share on, tighten the one nut and you are ready for work.

The share can be removed in thirty seconds and replaced in sixty seconds. Takes from eight minutes to half hour to change old style bolted shares.



Here's what John Deere Quick Detachable Shares mean to you:

1. No trouble to change shares.
2. Eighty per cent of time saved.
3. No danger of damaging share.
4. Share is drawn up closer.
5. Share is stronger—not weakened by bolt holes.
6. Resharpened or sprung shares can be drawn into place—no drift punch necessary.
7. No unequal strain on share.
8. No danger of injury to hands in taking share off.

We have beautifully illustrated booklets on the following plows with John Deere Quick Detachable Shares:

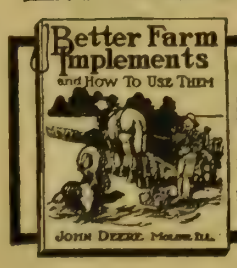
New Deere Sulky and Gang
(High Lift Frame Plows)

John Deere Stag Sulky and Gang
(Low Lift Frameless Plows)

John Deere Two-Way Sulky
(Side Hill or Irrigated Land)

John Deere Engine Gangs
(For Traction Engines)

Write for the booklet above that you want and we will send it to you free.



Better Farm Implements and How to Use Them

FREE BOOK Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, discs harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X-111.

We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

WHEAT

Comparison of wheat prices in 1915 and 1914 is most interesting to the wheat producer and, possibly we may safely add, to the consumer. The United States over an average price of 83.1 cents prevailed in 1914, while in 1915 the price at same date was $1.33. It is also interesting to note that the production of this country this year, together with its holdover from last year, was the greatest ever. - Presumably prices will materially decline during the next few months. However it is to be noted that nearly all countries outside of the war zone are producing greatly increased crops.

FARM MARKETS

The legislature of Idaho has passed, and the governor has signed, a bill calling for the creation of the office of director of farm markets. The director shall be appointed by the governor and it shall be his duty to promote in the interest of the public more economical and efficient distribution of farm commodities. He shall maintain a market news service, including information as to crops, freight rates, commission rates, and any matter which may be of service to the producer or the consumer. In fact, he shall act as a clearing house of information between producer and consumer. It shall be his duty to investigate the methods of commission merchants and others who receive, solicit and in any way handle the produce of farms. It shall be his duty to take legal action if necessary.

CORN

The word, "corn" is bantered about so recklessly and applied to so many different things that it has ceased to have a very definite value in our language. Of course, in a large sense the word means the seed of any cereal or grass, and it is commonly so used in England. It the United States it is usually applied to Indian corn, but in the Imperial Valley "corn" means kaffir or some of the sorghums. Still more objectionable is the practice of adding maize after milo. Milo is in no sense a maize, and this combination of words is without sense and most confusing to anyone who wishes to know what grain is referred to. It seems to us that with the general application of the word "corn" to Indian corn, or the true maize, that this use should be followed in this state. If each locality makes different use of the same terms, it makes a most embarrassing situation to one who would use these words when many sections of the state and the country are to be informed.

RIPE OLIVES

We all ate olives—excuse us, California Ripe Olives. And they were fine, thank you. The Los Angeles Chamber of Commerce and doubtless nearly every other C. of C. in California kept open house and served ripe olives. As we stood near the table from which the young ladies were serving them we heard repeatedly from Eastern visitors, "Well, I never ate olives like that before." With each little parcel of olives given out were "Ten Reasons Why You Should Eat California Ripe Olives."

"Have a delicious flavor.

"Have a high food value.

"Can be given to children in place of candy.

"Can be eaten freely with no ill effects.

"Are an economical food.

"Are a typical California fruit.

"Make delicious salads.

"Are a good brain food.

"Are allowed to ripen on the tree (all fruit is better ripened on the tree).

"Eat them and boost California, Nineteen Fifteen."

PATRIOTISM AND PRODUCTION

The Dominion of Canada is making an appeal to all its farmers to produce as never before. The slogan of this campaign is "Patriotism and Production." In a circular recently issued, the department says:

"Patriotism without production is an empty sound. If ever there was a time when by your deeds you are required to be known, it is now. Now, when the Empire is at war; now, when many of the regular channels of supply are closed; now, when men in millions have been summoned from the paths of industry to the inferno of destruction. In entering upon the campaign in which it is now engaged, the department of agriculture of the Dominion has entered upon a task that should do untold good. It is not that our farmers needed altogether to be prompted to benefit themselves, but that perhaps some of them do not entirely recognize the seriousness of the present and the more than probable critical conditions of the future. If the war were to end tomorrow, there would still be need for every effort in productiveness, for many years must elapse before the devastation that has been caused can be remedied or repaired. Unhappily, the probabilities are that the giant conflict will continue for many months yet, in which case the mind of man cannot fathom or foresee the damage that will have been done to every form of industry, to agriculture in particular, by the waste of life, by the wrecking of property, and by the spreading of desolation. It is in repairing the damage others cause that the farmers are called upon to aid. It is their mother country that cries to them."

By the way, we see no reason why patriotism and production may not go together in America as well as in those countries more nearly affected by war conditions.

LIVE STOCK ASSOCIATION

The American National Live Stock Association ended its 18th annual convention at San Francisco last has served for six years, insisted Friday evening. President Jastro, who on retiring from active work as executive officer. In retiring he assured the members of his interest in the welfare of the association and said that he would continue to do all in his power for the welfare of the cattlemen.

The proceedings of the convention were without special note other than some little feeling was expressed as to freight rates. Members were free in charging the railroads with demanding excessive rates. President Sproule of the Southern Pacific was called on by President Jastro, and he replied that he has no cause to plead, that the public and the railroads "stand on common ground. Neither should ask for special privilege. All we ask is a fair field and a fair deal."

Dwight B. Heard of Phoenix, Arizona, was elected chief executive to succeed H. A. Jastro of Bakersfield. I. T. Pryor of San Antonio, Texas, is the new first vice-president. The other vice-presidents are J. B. Kendrick of Cheyenne, Wyoming; C. M. O'Donnell of Bell Ranch, New Mexico; M. K. Parsons of Salt Lake City, Utah; Wallace Huidekoper of Billings, Montana; Isaac Baer of Meeker, Colorado; W. J. Todd of Maple Hill, Kansas. John W. Springer of Denver, Colorado, is treasurer, and T. W. Tomlinson of the same city is secretary. S. H. Cowan of Fort Worth, Texas, is attorney.

El Paso was selected as the meeting place for the next annual gathering.

The resolutions adopted are as follows:

Demanding import duty on live stock and its products; indorsing the work of the bureau of animal industry and the various sanitary officials of western states for their work in the eradication of "foot and mouth disease epidemic;" demanding more thorough inspection of the wholesomeness of imported meat food products; demanding protection from the federal government for American live stock owners in the republic of Mexico; requesting adequate inspection of live stock and meats imported from Mexico; asking for funds to carry on the work of suppressing infectious diseases; indorsing the work of agricultural colleges; opposing the prohibitive tax on oleomargarine; indorsing the administration of national forests; favoring federal control of public grazing lands; thanking the railroads for certain rate readjustments from Montana westbound; asking for an appropriation for the destruction of predatory wild animals; protesting against the proposed advance in railroad rates on live stock, and asking railroads to readjust westbound rates on live stock.

University of California experts are investigating a new disease affecting pears near Auburn, Placer County.

Agricultural Notes

The American Association of Nurserymen will hold it 40th annual convention at Detroit, Michigan, June 2 to 25.

The Australian government is buying and killing sheep and beef cattle supplying direct to local markets Other measures are being adopted t lower cost of food supplies.

Lemons valued at $1,180,570 were invoiced through the American consulate at Catania, Sicily, for the United States during last year compared with $1,447,514 worth for 1913.

New York celebrated potato week from March 29 to April 3. The state agricultural college proposed the plan urging consumers to buy in large quantities and growers to sell at low figures for that one week.

More than 28,000 square miles of territory were released by the secretary of agriculture on March 1 from the Texas fever quarantine. The release order affects 32 counties in the United States. San Diego County in California is included.

The fruit growers in the province of Mendoza, Argentine, have formed a cooperative society for the sale of fruit in Mendoza and other large cities, so as to give an outlet to the large fruit crop of the Andine regions and at the same time create a market for grapes.

A large demand for cattle has arisen in Russia and Siberia, in consequence of which large exportations from Chosen are taking place. The latest order is for 50,000 head, 20,000 of which are to be Korean cattle, the balance to be supplied by Shantung Province in China.

No European pine trees will be permitted to be imported into the United States after July 1, a quarantine order to this effect having been signed by the secretary of agriculture. This action has been taken to save pine trees from the pine shoot moth which has long done much damage in European forests.

The importation of all Indian corn from Java, India, and parts of Oceania has been prohibited by a recent order signed by the secretary of agriculture. This action has been made necessary by the presence in corn from these regions of a disease known as Sclerospora Maydis, which causes the leaves of the corn plant to turn brown and dry up.

According to the official statement just issued, the inhabitants of Petrograd paid, during 1914, $10,000,000 more than in 1913 for actual necessities of life. The advance in prices was due to the war. The following are the articles that showed the largest percentage of increase in price over the preceding year: Salt, 50 per cent; rice, 56 per cent; groats, 57 per cent; flour, 18 to 20 per cent; butter, 12 per cent; meat, 26 per cent; sugar, 14 per cent; eggs, 3 per cent.

During the past four or five years experiments have been carried on in the southern part of French Indo-China for the purpose of turning to some profit the water hyacinth, which incumbers the waters of Cochin China and Cambodia to such a degree that is has become a menace to navigation. The most extensive and successful of these experiments have been in use of the fiber in the manufacture of rope, twine, matting, paddy sacks, boxes and chairs, sofas, cradles, and other articles of furniture. It has been mixed with silk to form a somewhat stiff but durable cloth.

Agricultural News Notes of the Pacific Coast

Northern California

The Butte County rice exposition will be held at Chico, May 24-29.

Large plantings of Thompson Seedless grapes are being made in Yuba County.

The California Cured Fruit Exchange reports slow demand for dried peaches.

Boys' agricultural clubs are being organized in the schools of Orland, Glenn County.

Several thousand acres of almonds have been planted during the past season at Pennington, Sutter County.

Grass Valley, Nevada, is planning for the shipment of a larger quantity of fresh deciduous fruits than any preceding year.

Butte County's board of supervisors has passed a resolution authorizing the purchase of $150,000 worth of state highway bonds.

Eighteen thousand acres of fine land has been reclaimed near Meridian, Sutter County, and is now being planted to various crops.

The Woodland Cured Fruit Association of Yolo County has affiliated with the California Cured Fruit Exchange for another year.

Farmers of Yolo County are making more persistent effort to eradicate hog cholera which has prevailed for some time in that county.

Poultrymen are calling for a state commission on poultry which shall have power similar to the state horticultural and other commissions.

The San Francisco Chronicle states that every available acre of bottom land in Yuba and Sutter Counties is to be planted to rice this season.

The bureau of correspondence instruction of the University of California shows an enrollment of 2,502 in the classes.

The Yuba County chamber of commerce has installed an information bureau at its headquarters in Marysville for the benefit of visitors who are arriving in bunches now.

A Los Molinos, Tehama County, rancher has just purchased a bunch of pure bred Jerseys consisting of 16 cows and a bull. He has sold all his grade cattle and will give his un divided attention to Jerseys.

The Anderson Creamery Company of Anderson, Shasta Company, is making arrangements to enlarge its plant so that it can produce 6000 pounds of butter per day. This will make this creamery the largest in Northern California.

Farmers of southern Lassen County met recently at Doyle and decided to push the formation of an irrigation district which contemplates the reclamation of 200,000 acres. It will call for the issuance of bonds to the extent of $3,500,000.

Many residents of the Sacramento Valley are disappointed in the exhibit which has been made at the Panama-Pacific Exposition, and more at the returns which the valley is not receiving. A committee has been working on a plan which calls for more satisfactory exhibits.

Central California

It is reported that 20,000 acres of raisin grapes will be planted in Kings County this year.

Merced County is now interested in rice culture and several plantings will be made this spring.

Fumigation work in Tulare County will be done under the direction of county officials this season.

Fresno will next September entertain delegates to the 22nd annual International Irrigation Congress.

An apple blossom festival is proposed to take the place of the Apple Annual this year at Watsonville.

The San Joaquin Sugar Company of Visalia is inducing farmers of Merced County to put in sugar beet acreage.

The Tulare County Protective Association is now interesting itself in the marketing end of the citrus business.

The Dinuba Grange has suggested the advisability of securing a farm adviser for the Alta Irrigation District.

At the recent annual meeting of the Corralitos, Santa Clara County, Fruit Growers' Association L. E. Elliott was elected president.

Fruit growers of the Youngstown colony in Stanislaus County have formed an association to market their canning fruits the coming season.

R. M. Roberts, agricultural demonstrator for the Santa Fe, says that there are 3500 acres of apples and pears in excellent condition in the country about Tehachapi.

Efforts are being made to have Raisin Day, April 30, declared a school holiday by every school in Fresno County. All of Fresno's city schools have a holiday on that day.

Melon growers at Turlock have incorporated under the name Cooperative Cantaloupe Growers. The principal object of the corporation is to handle the marketing end of the business.

Raisin growers of Fowler, Fresno County, have appointed a committee to secure new contracts for the Associated Raisin Company. The committee is meeting with marked success in its work.

Nearly 100 orange growers of Tulare County, at a meeting called recently by the officers of the Tulare County Protective Association, unanimously went on record as favoring a continuance of orange testing and certification of shipping fruit.

The Apple Annual Association, in its recent meeting at Watsonville, elected the following directors for the ensuing year: O. D. Stoesser, J. E. Gardner, W. R. Porter, Mateo Lettunich, Luke Scurich, Geo. W. Sill, J. H. Thompson, E. A. Hall, J. H. Rowe, W. J. McGrath, R. H. Goodchild, E. Steinhauser and C. H. Baker.

The Stanislaus County Cow Testing Association has started a campaign to increase its membership. The following officers have been elected for the ensuing year: State Dairy Inspector C. A. Starkweather, president; J. W. Scott, vice-president. Other officers elected are: Directors, C. L. Morse, W. L. Bowen and E. F. Young.

Southern California

Bean planting has begun in the Garden Grove section of Orange County.

There will be a considerable acreage of beans planted in Imperial Valley this season.

Some dairymen of Orange County maintain that there is an oversupply of dairies in that county.

The Orange County Fruit Exchange estimates that it will handle 1300 cars of Valencias as against 1000 last year.

The Citrus Association packing house at Olive in Orange County is to be constructed and ready for business by May 15.

Twenty-nine carloads of sheep from an Arizona ranch were received last week at Brawley to be fattened on green pasture.

The Tustin Lemon Association of Orange County is putting up a temporary packing house which will hold about 15 carloads of lemons.

The Santa Ana Valley Growers' Association has decided to re-lease its present packing house instead of building as was proposed.

On March 1 the price of milk was reduced by the creameries in Los Angeles County from $2.35 to $2.00 per 100 pounds to the producers.

J. M. Davison of Arlington has been elected trustee of the Poultrymen's Association of Southern California. He will represent the Riverside district.

The Southern California Milk Producers' Association has been organized with a membership of more than 300 milk producers to supply the creameries of Los Angeles.

The annual meeting of the Hemet Cured Fruit Association will be held April 24. During the season just closed 445 tons of apricots were dried and processed by the association.

Seventeen years' litigation has been settled between settlers in the Perris Valley and the irrigation company. Settlement was made by a compromise. This will clear the titles on all land involved.

The La Habra district of Orange County will soon have a new orange and lemon packing house on the La Habra electric line. This association is a new one. About 500 acres of young orchard are owned by its members.

The Poultrymen's Association of Southern California has divided Southern California into five districts to facilitate managing of its business. The centers of these districts are Los Angeles, Gardena, San Garbiel, Pomona and Riverside.

United States Date Inspector Shamblin, together with Bruce Drummond, in charge of the date experiment stations at Indio and Mecca, is making inspection of all date plantations in the valley with the view to conducting a strict campaign against date scales.

Imperial Valley expects soon to receive a shipment of 2,000,000 lady birds to combat aphis in the cantaloupe and barley fields. These will be sent from the state insectary at Sacramento to County Horticultural Commissioner Waite and he will distribute them to the fields.

The Coast

Monmouth, Oregon, will soon have a new cheese factory.

The storage of eggs is very slow in starting this spring in Washington.

Twenty-five carloads of horses were recently sold at auction at the union stock yards at Caldwell, Idaho.

The cattlemen of Williams, Arizona, have voted against the building of drift fences on forest reserves.

The Utah Fruit Growers' Association has made the Utah Farmer its official organ. The Farmer is printed at Lehi.

Wool buyers in the district of North Yakima, Washington, are not finding holders very anxious to dispose of their clip.

A Pure Bred Beef Breeders' Association has been organized among stockmen of the Gallatin Valley, Montana.

Oregon hens claim they have the lead in the International Egg Laying Contest being held in connection with the Panama-Pacific Exposition.

A statement made by dealers operating in the Yakima Valley of Washington shows that there are in that district some 250 cars of apples in cold storage.

It is proposed to build a potato starch factory in Jefferson County, Oregon. The farmers are planning to plant more heavily to potatoes than ever before.

The University of Arizona is starting poultry clubs among boys and girls of the state. L. S. Park of the university extension service is in charge of the work.

Some one is proposing to utilize the wild grasses growing along the Colorado river bottoms for manufacture of rope. This wild hemp is said to make a first class product.

By a recently enacted bill the state of Arizona accepts the provisions of the Smith-Lever bill and appropriates sufficient funds each year to meet the increase provided by that law.

Arizona was well represented at the convention of the American National Live Stock Association at San Francisco last week. Two special cars carried the Arizona representation.

The Lake Chelan district of Oregon is planning to produce a new fruit product in the shape of compressed fruit bricks. Fifty pouds of apples are compressed into a ten-pound brick.

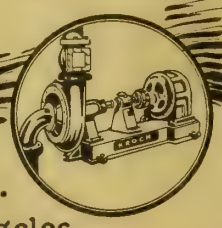
The by-products committee of the North Pacific Fruit Distributors has issued a formal program of work to be undertaken by the cooperating associations represented by its members.

Fruit growers of Colorado have organized a general selling concern which will handle products of the members. It is expected that the organization will handle at least 75 per cent of Colorado's fruits.

The shipping organizations of the Northwest, representing a tonnage of 16,000 cars, have formed an organization known as the Northwest Fruit Shippers' Council. The president of the governing board is H. F. Davidson, of Hood River, who is president of the North Pacific Fruit Distributors of Spokane.

Krogh Pumps

You should take no chances on your water supply — Krogh Pumps will supply all water for the San Francisco Fair. Consider for yourself why they were chosen.

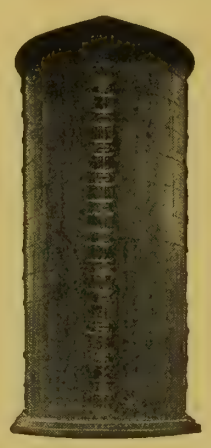


Krogh Mfg. Co.
San Francisco - Los Angeles.

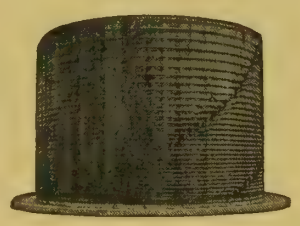
SILOS

BUILT FOR YOUR PARTICULAR NEEDS.
EXACTLY AS YOU WANT THEM.
ALL SIZES AND DIMENSIONS

16 x 36 Redwood Stave Silo manuafactured by us for the Panama-Pacific International Exposition, San Francisco, 1915



TANKS

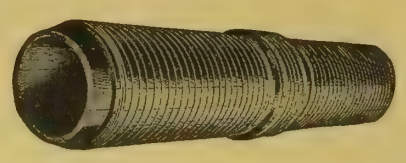


Built to order, to suit all uses and users. Cheaper than metal tanks, last longer. Won't rust. Can be taken down and re-erected without damage. Capacities, 500 to 500,000 Gallons. Towers included if you want them.

PIPE

MACHINE BANDED OR CONTINUOUS STAVE

For water supply—irrigation or power. Cheaper than any other pipe of equal size or capacity. Longer lived than any metal pipe except cast iron.



All our silos, tanks and pipe are designed by engineers to meet every condition. Made in our big factory from CLEAR, AIR DRIED REDWOOD. Selected from a stock of 40 million feet which we carry at all times.

Live Stock and Dairy

LIVE STOCK NOTES

Written for California Cultivator
By Sacramento Valley Contributor

NOTHING should be hauled to market that can be made to go on foot." This is a good maxim to print in big letters, frame and hang over the fireplace.

This means that all rough feed on a farm should be fed to animals, and its liberal construction would include as "marketed on foot" hogs that might be hauled in a wagon to market or dairy products, for both the hog and the dairy cow are "on foot" transformers of grain and forage into animal products of high "per pound" value.

Although the entire grain and forage crop of California could doubtless be profitably converted into meat and milk, a change in the plans of all who are growing barley, wheat and alfalfa could not, and surely will not, take place in one year or ten, probably never—but there are many individual farmers who could gradually work over their plans and year by year equip their places for the care of live stock to consume the feed they produce.

And when a farm is changed over from grain and forage production, the hay and grain to be sold as such, to a stock farm where most of the stock marketed is grown on the place, there will be a big increase in the average income per year.

During the past ten years there has been an increase in the output of all staple farm products except corn, hogs, cattle and sheep, and in the production of meat making animals there has been a marked decrease. In 1899 there were 50,000,000 cattle in the United States, in 1909 only 41,000,000. In the same period the number of sheep decreased from 61,000,000 to 52,000,000, and hogs from 63,000,000 to 58,000,000.

This would make it appear that the production of meat animals for the next decade, and probably for all time, will be one of the best businesses in the world, and particularly so in California's big valleys where climate is favorable to the continuous even growth of animals and where maximum crops of grain and hay can be raised. And where live stock is raised and the manure put back on the land, either by the animals themselves while at pasture, or with a manure spreader, the crops of grain and hay can be made greater year by year and a system of agriculture built up that will endure for generations.

Silage for Horses

Silage is not generally considered as a horse feed. It is first of all a high class feed for dairy cows. Now all of the big feeders of beef cattle throughout the corn belt and well out into the range country in Texas and Oklahoma are feeding silage, and it is considered indispensable by many feeders of sheep.

But the average man, somewhat informed on the subject of feed and feeding, will say without hesitation that silage is not much of a horse feed.

Now comes a report from the Middle West from a prominent horse breeding farm where high class and pure-bred horses are bred and raised. The splendid condition of the stock being commented upon by a visitor, the owner was asked to explain it—if there was any reason except ordinary good care and handling. In reply the visitor was directed to look around behind the barn where he say a silo. He was told that a small amount of silage, four or five or six pounds per head, was fed daily throughout the entire year, as much as a tonic or conditioner or appetizer as anything else, but that it apparently kept the digestive tract in good condition and was an important factor in the general thrift and well being of the stock.

Care must be exercised, however, in feeding silage to horses; it must be clean and free from mould. Mouldy silage will cause indigestion and other troubles.

Give the Mules a Chance

At seasons of the year when there is no work to be done the mules and other work animals are turned out to rustle for themselves. And generally it is perfectly all right that they should be. The mules are better off for the exercise and the variety of feed they get, the place is the better off to have the fields cleaned up somewhat and to have the manure from the stock well distributed over the land, and the time that would otherwise be devoted to feeding the stock and cleaning out stables, if they are kept up, can be used to good advantage at a hundred and one jobs all around the farm.

But—there often comes a time when the feed gets short and the weather a little rainy or rough, when all of the stock, or perhaps only a few of them, begin to go back with their hair standing up too straight and with flesh lost. Then it is that it pays and pays well to take these animals up and give them plenty of good feed and such shelter as they need. For shelter a dry bed in a shed out of a draft is ample in the Sacramento Valley.

It is a fine thing to have the stock out of the way for awhile, but it must be remembered that a time is coming soon when a big day's work will be required of all work animals and when such time comes it is poor economy to hire a man to work a team a day when the team is fit to do only two-thirds of a day's work.

No other grain or good hay that is fed throughout the entire year produces such pronounced results as does that fed in this way.

Danger in Skim Milk

Much disease has been spread through skim milk. Tuberculosis in hogs throughout the principal dairy sections of the Middle West is traceable largely to this source, and now creamery skim milk, contaminated from the product from one producer, is responsible for the spread of foot and mouth disease in Dupage County, Illinois. A farmer in an infected district made light of the disease and took milk to the creamery from a cow suffering from the malady. As the skim milk was not pasteurized and all of the patrons of the creamery took skim milk home to feed to the calves and pigs, 24 farms were soon made seats of infection.

In central Wisconsin, so common has hog cholera in hogs become, where skim milk from the cows is a common feed for hogs, one small pork products concern has great difficulty in securing hogs that are of high quality as far as the meat is concerned and free from all disease. They now obtain practically all of their supply from hogs grown on dairy farms where the cows are all tuberculin tested and where only the skim milk from the cows in the home herd is fed to the hogs. And great care must be taken in these herds to keep them clean. All cows or heifers or bulls that are bought must be tested for tuberculosis, and breeding hogs that are added must come from herds that are known to be disease free.

And in spite of all this skim milk is one of the most valuable feed assets on a farm, and if it is not possible to secure it from sources known to be free from infection, it should be pasteurized or boiled to kill all disease germs. If pasteurization in a regular pasteurizing outfit is not possible, a thorough boiling at home, before feeding, should be given. The same applies to buttermilk.

CALF FEEDING

The proper growth and development of the calf is equally as important as the care of the full-grown cow, for good cows cannot be made out of poorly fed calves. Whether the calf is destined for the dairy or for the bles, the true principle is to in a thrifty growing condi- end is reached. It is ary that the calf be fat—in fact, it is better not to be so. The feed should be such as to produce bone and muscle to form a strong framework with which to produce milk or upon which to lay fat in the time of maturity. The mother's milk, if it be not too rich in fat, furnishes the best food for the purpose, but in our commercial dairying butter fat can be disposed of at a higher price if made into cheese or butter and a substitute offered which is cheaper.

If the calf is to be raised on skim milk as the principal food, it should receive fresh whole milk for the first ten days or two weeks. Then substitute skim for whole milk, a little at first, and increase gradually until, by the time the calf is three weeks old it may receive no whole milk whatever. As soon as this substitution begins add a small handful of wheat middlings to the ration and increase the quantity gradually as the skim milk is increased. Induce the calf to eat dry grain and hay as soon as possible and give the milk simply as a drink. It will be remembered that skim milk is highly nitrogenous, and to make it a perfect food requires the addition of carbonaceous material. Nothing supplies this any better than corn meal, but owing to its high price rolled barley may be used, mixing barley, wheat, bran, and middlings in equal parts and feeding from one to two quarts per day by the time the calf is two months old.

In the case of feeding whey one may begin when the calf is about two weeks old by adding a little to the regular ration of whole milk and increasing the portion, as suggested above with skim milk, until the calf is a month old, when the milk may be taken away entirely. Unlike skim milk, whey is more largely carbonaceous, owing to the removal of the casein as well as the butterfat. Thus the grain ration should contain more protein than for skim milk feeding, and for this reason some linseed oilcake meal should be added to the middlings as soon as the whey is fed. Whenever the calf can be induced to eat the grain dry, give a mixture of two parts each of bran and middlings and one part of linseed meal. The calf develops a stronger digestion if it can be early induced to eat hay and its grain dry, and drink the milk or whey alone. The chief difficulties in feeding whey arise from permitting it to sour before feeding and depending upon it as the sole food. While it may be possible to raise fairly good calves on skim milk alone it should never be attempted with whey, because the latter contains only about two-thirds as much food substance as the former. Both should always be fed sweet. The amount of grain necessary depends upon the quality of hay or pasture to which the calf has access. The hay should preferably be alfalfa.—Jaffa and Anderson, in Bulletin 132, California Agricultural Experiment Station.

WHY PURE BRED STOCK?

A lady unfamiliar with live stock asked the writer this question, "Why is pure bred stock best?"

In the first place pure bred stock is best because a perfected product. It has been selected and bred and every possible improvement introduced and added from time to time in order to supply certain needs of man of an animal profitable in the highest degree.

Every standard breed is a specialist in its line. The dairy cow is like a machine developed for the purpose of converting forage plants and grain into milk and butterfat with the least possible waste. Common stock was the crude working model from which she was produced.

She is a finished product, or perfected machine, whose capacity for manufacturing the above commodities has been increased by hundreds of pounds over the capacity of the original model.

Then we have the beef breeds designed to convert the same plants into another article of food called beef. They are adjusted in a way to divert food into an opposite direction from the milking strains, making equally valuable the different products from the same materials.

Then we have a big machine for carrying heavy loads and moving freight, called the drafter. Another, the light runabout, or pleasure horse. He was once the nation's pride and is still the most admired of all animals. He is a marvelously fine running machine and the nearer he approaches the pure blood the better he is.

A few contend that grades are equally as good as full bloods. While grades are good and quite satisfactory, their main recommendation is the fact that they may more easily and more cheaply be obtained. While it is a fact that grade animals have made a number of world's records, it is also a fact that they were enabled to reach distinction because of the pure blood in their veins. In a few instances, race horses of unknown breeding or supposedly common blood have approached or even set world's records. But, in every instance, on careful investigation of their ancestry, a dominant purple strain is revealed.—Farm Stock and Home.

In securing expensive sires much can be gained by breeders in purchasing desirable animals. The cost of an animal, the best that can be had, might be prohibitory for one man or even two or three men, but when a dozen or two dozen share the cost it would not cost the individual a large amount. Then the cost of keeping could be reduced the same way.

AN IDEAL GREEN FEED SILO

Is not merely a tank or a barnyard building, but is a THOROUGHLY PRACTICAL PIECE OF DAIRY EQUIPMENT.

Over Twenty Years of Practical Experience

in silo building has enabled us to overcome the difficulties in silo construction and to build a silo that will return to you as good ensilage every pound of good feed you put into it.

To experiment will be expensive for you. Why not profit by the experience of over 20,000 users of the

Ideal Green Feed Silo

and order yours now?

A LESSON ON PIGS

In this year's pig raising contest of the boys' pig clubs of North Dakota, the average profits per litter, with pork at 6 cents, were: For the Poland China, $38.10; for the Duroc Jersey, $42.26; for the Yorkshire, $48.33; for the Chester White, $34.30; for the Cross breed, $26.38.

The average profit of the 24 litters that stood highest was $61.04.

Corn, barley and oats were the main feed used. Shorts, screenings, rye and speltz were also used. Nearly all used pasture, two-thirds of them fed considerable milk. The value given the foods were as follows. Corn, 49 cents per bushel; oats, 32 cents; barley, 45 cents; rye, 57 cents; bran and shorts, $19.00; screenings, $10; skim milk, 25 cents per hundred weight; grass pasture, $3.49 per acre. —W. E. Vaplon, State Leader Boys' and Girls' Clubs, Colorado Agricultural College.

BUTTER WON'T COME

Answering a query as to frothing cream in which the butter will not gather, in the National Stockman and Farmer, a writer says:

Difficult churning is usually due to the failure to develop the proper amount of acid in the cream. When cream sours, the butterfat particles unite more readily, and during the winter it is sometimes diffcult to get the proper acid developed. Usually, however, if the cream is held at the proper temperature normal souring will take place.

Separate the cream at once and place it in cans that have been washed and then scalded with boiling water. Keep this cream cold and add other cream to it after it has been properly cooled, until the day before churning. The churning should be done at least once a week, preferably twice. The night before churning the cream should be gradually warmed up to 70 degrees to 75 degrees Fahrenheit and held at that temperature until the next morning, when it should have a slightly sour taste. In order to hold the cream over night it may be necessary to put the can of cream in a tub of water, which should be 75 degrees and if the temperature goes down, a little warm water may be added the last thing in the evening. The following morning the cream should be cooled to churning temperature, and held at that temperature for about an hour, then churned. The churning temperature will depend upon the way the cows have been fed and somewhat upon the breed of cow, usually 60 degrees is sufficient at this time of the year. If, however, the butter comes soon and soft at this temperature, then a somewhat lower temperature should be used the next time, or, if on the other hand, it requires more than a half hour to churn and the butter becomes very hard then a higher temperature should be used. Do not have the churn over one-third full and then churn at such speed that the cream will dash each time.

With this treatment of the cream you ought not to have any difficulty in getting butter.

Occasionally, however, there are cows that do produce abnormal milk, especially if they have been milking a long time without having a calf, or if they are not fed sufficiently. It would pay to give a cow grain in addition to silage. The physical condition of the cow should also be observed. See to it that the bowels are kept in good condition. With sufficient silage there ought not to be any difficulty in keeping animals in a laxative condition. A dose of salts or a bran mash often affects the cows so that they will produce normal milk when they would not be doing so otherwise.

According to investigations a dairy cow will recover for human food about 25 per cent of the dry digestible matter consumed; a hog about 15 per cent, and a steer about 3 per cent. This, togehter with the fact that a good dairy cow will return $2 worth of produce for every $1 worth of feed consumed, should be a covincing argument in her favor.

The cow pays for her board every day if she is the right kind. And the up-to-date dairyman doesn't care to keep any but the right kind.

Are you troubled by rats and mice gnawing your harness? That's because you've used harness dressing containing animal oils which always attract rodents.

EUREKA HARNESS OIL

contains no animal oils,—and rodents won't touch harness that's treated with it. Eureka nourishes the leather fibre—keeps your harness soft, pliable and strong. Have your harness man dip your harness in Eureka Harness Oil. Or buy a can and apply it yourself. It's easy—and it *pays*. Make your harness last longer. Dealers everywhere.

Potato Pointers

By Horticultural Commissioner A. J. Cook in Monthly Bulletin

Very few agricultural products are so worthy to be knighted as the potato. It is a staple food article, and we have only to give its composition to indicate its rare worth. True, it has hardly more than two per cent of protein, yet we know that protein can be greatly reduced if the conserving starch or sugar is in abundance. Potatoes contain 18 per cent of starch. Starch is nature's favorite carbohydrate. In all the past starch has been a coveted food element. We thrive on what has nourished us from our infancy and from the infancy of the race. Potatoes carry only one-tenth of one per cent of fat, the hardest food element to digest, and 78 8-10 per cent of water. We have only to remember this last to gain a higher appreciation of the protein content of the potato. Where else other than in the potato field can we secure such a return per acre? Good husbandry may expect 500 bushels per acre of these nutritious tubers, a wealth of production scarcely equaled in any other field of agriculture.

We see then that whatever strikes at our potato industry is a certain menace to the welfare of the state. It is an alarming fact that our potato production in some of the best potato sections has been reduced to one-third of its former magnitude, and the end is not yet. In the recent past some growers have planted to reap little or nothing. Yet we are free to say that this decline is wholly owing to bad husbandry. Some of our growers, the wise and prudent ones, have produced banner crops, upward of 500 bushels per acre. Others in Oregon, Washington, Idaho, Colorado, Wisconsin and Maine are equally successful. The British Isles, Germany and The Netherlands eclipse even our best spud men in their production. Germany is reported to produce eighty million tons of potatoes annually. This is more than a ton per capita. If this report is correct, it is very suggestive. Is it not wise and worthy, then, to make every effort to improve our cultural methods, that we may reinstate the old-time success in the production of this excellent food product? We can not afford to do otherwise, as good clean seed is greatly in demand, and he who produces this will top the market in the prices he receives for his seed potatoes.

There are two potent causes for the decline in our potato production: diseased seed and infected soil. There are three fungous diseases that are now very prevalent in our state, all of which affect the potato, tubers or vines, or both: the common scab, which disfigures the tubers; the rhizoctonia fungus, which affects the vines and roots so that the growing potatoes secure too little nutrition and fail to develop, thus looking like a bunch of grapes, hence the name "little potato." These often appear above ground. The third is the fusarium wilt, which also blights the vines and the roots and later the tubers, which become diseased and are often destroyed. These last two affections are much more serious than the scab and are the principal factors in the destruction of the potatoes, not only in California but throughout the United States.

Scab and rhizoctonia are carried in the soil which has previously borne diseased potatoes, and so contains the germs, ready to inoculate newly planted seed. This is also true of fusarium wilt. Both these diseases also carry on affected seed, hyphae, or sclerotia, which serve as the seed to spread the destruction. These two evils are alike, in that seed affected by either one yields to treatment, if immersed for two hours in corrosive sublimate, 1 to 1000—1 ounce to 8 gallons of water—or in formalin, 1 ounce to 2 gallons of water.

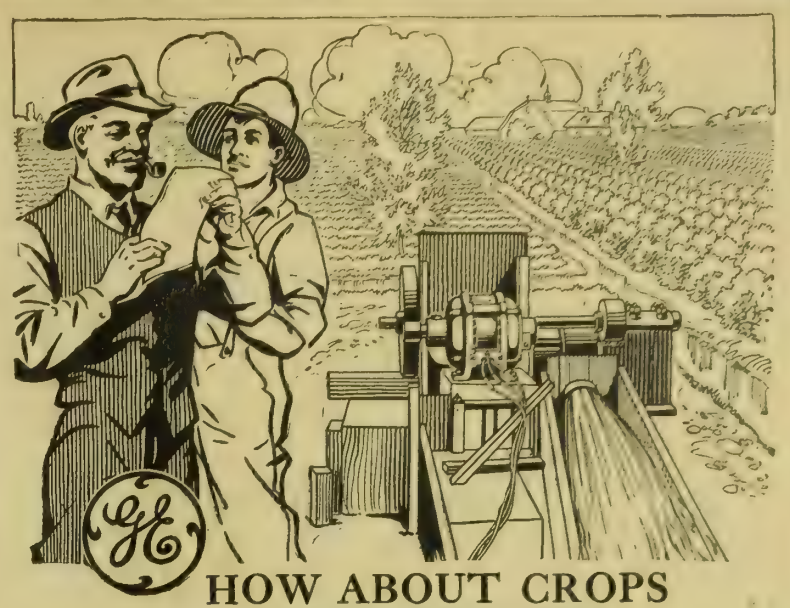
The rough eruptions (scab), so ugly in appearance, quickly reveal the presence of scab. It does not reduce the yield, but so mars the tubers that the price is materially lessened. The thick peel to remove the disease is also a considerable waste.

The destructive rhizoctonia appears as specks of dirt from the size of a pinhead to quite sizable patches. We know that these are not dirt, as their close adherence prevents removal when placed under the hydrant. We can, however, scrape them off with the finger nail without wounding the potato, which we can not do if the spots are scab. When thus removed the potato is not wounded. Of course, scab, which often resembles rhizoctonia, can not be removed without breaking the tissue. We should always treat the potatoes as described above if the eruptive scab or the closely adherent rhizoctonia is present. Indeed, it is always a safe precaution to treat apparently sound seed, lest a very slight infection is present, so minute as to escape detection.

The third fungus, worse than rhizoctonia and far worse than scab, is the fusarium wilt. This blights the vine, kills the roots, stops growth and is fatal to the crop. The vines die prematurely, and the potatoes that survive affection, or are not sufficiently diseased to be observed on the exterior surface, will often show the work of the fungus if a slice is cut from the stem end of the tuber. A discolored spot, usually a ring on the cut surface, indicates that the disease is present and that the seed is unfit to plant. We note then that the presence of fusarium wilt is shown in the meager crop, premature dying of the vines and the discolored spot or ring on a slice cut from the stem end of the potato. Such evidence should lead to rejection of all such tubers for seed purposes. This disease is so prevalent in most parts of the country that even when we find no sign of its presence it is a wise precaution to cut a generous slice from the stem end of the potato before planting.

A tainted soil is as sure to result in fungous affection as affected seed. Such poisoned soils are not quick to lose the toxic germs. It is believed that six years, possibly eight, are required to rid tainted soil of the fungous germs or the presence of nematodes. This explains why a long rotation of crops, six or eight years, so desirable in general agriculture, is imperative in growing potatoes. The crops included in the rotation should be such as would not favor the potato fungi. In Europe some cereal occupies the last two or three years of the rotation. I need not say that rich, well aerated soil, like that of a well-kept garden, good cultivation and abundant water are desirable in potato culture. It pays richly to fertilize heavily. A generous supply of stable fertilizer, nitrates and phosphates in good quantity will pay well. I know a potato

(Continued on Page 407)



HOW ABOUT CROPS THIS SUMMER?

Proper irrigation will more than double your crops—ask your neighbor who has tried it.

Electric motor-driven pumps will solve any irrigation problem. They need no attendant, deliver water steadily day and night and cost but little to operate. Insist on a

G-E ELECTRIC MOTOR FOR RANCH AND FARM

to do your pumping. It will pay for itself in a short time in bigger crops, perfect satisfaction and low upkeep.

A G-E portable motor can be used to drive various farm machinery, greatly reducing your labor bills and insuring you against scarcity of "help".

Your local power company will gladly tell you what G-E motors can do for you; or write our nearest office for booklet No. 3166 on electric farming—the request will place you under no obligation.

RATIONS IN EGG LAYING CONTEST

By V. O. Hobbs, in Charge of Egg Laying Contest at Mountain Grove, Missouri

THERE is no doubt that cheapness and availability of a ration have a big influence in its use. In many sections cottonseed meal is available and is much cheaper than beef scrap. The Missouri station is making a test of the efficiency of cottonseed meal to ascertain whether the protein of cottonseed meal is as efficient as the protein that comes from beef scrap. So far the results from the cottonseed meal rations have been good. Three pens of hens are being used in this test. Two of them are being fed on a mash with the principal source of protein cottonseed meal and one check pen that is fed on a mash with beef scrap as its source of protein.

Here are the rations that are being used:

LOT 1.

	Lbs.
C. S. meal	15
Corn meal	15
Crushed oats	12
Bone meal	8
Cracked corn	42
Oats	8
	100

1:4.5 plus.

LOT 2.

	Lbs.
C. S. meal	15
Wheat bran	15
Corn meal	12
Bone meal	8
Cracked corn	42
Wheat	8
	100

1:4.5 plus.

LOT 3.

	Lbs.
Beef scrap	11
Wheat bran	15
Corn meal	10
Bone ash	8
Cracked corn	47
Wheat	9
	100

1:4.5 plus.

Add salt in the proportion of 1 lb. to every hundred pounds of the ground feed.

The pen fed on ration No. 1 leads last month in egg production by a small margin. In feeding this ration we have used one pint of grain to each ten hens. The fact that the grain ration is wide caused us to reduce the amount of grain that we usually feed so as to force the hens to e at plenty of the mash. They are eating about the same amount of mash as they do grain.

The White Orpingtons have taken the lead in the honor roll as the first in the list of pens for the month of February, and a White Orpington hen, 277, is leading the list of the ten highest hens. The Orpington class has demonstrated that they have the ability to repeat in February as they have walked off with the February honor three times before.

The ten leading pens for the month are all dual purpose fowls. Pen 43 White Orpingtons, Wisconsin, won the cup for February, laying 113 eggs.

The six highest hens thus far during the contest are White Orpington, Barred Rock, White Rock, R. I. White, S. C. W. Leghorn, Buff Orpington.

Feed prices have soared high and times have been hard, but we have never before witnessed such a widespread interest in the poultry work. This interest is not confined to one section, but is nation-wide. The best breeders are reporting a good egg business thus far. We just wonder if the underlying cause is due to the fact that necessity is driving people to discard the non-laying type in order to get stock that will show a net profit on the high-priced feed that they must use. It is certainly no time for guesswork, and we are glad that poultry people and farmers are seeking the

SOMETHING ABOUT THE NEWEST AND BEST BOOK, "POULTRY FOR PROFIT"

Readers of the Press poultry department, who for several years have read the helpful articles on poultry culture by Mrs. Jean A. Koethen will be interested in the announcement that Mrs. Koethen has written a poultry book. The Press is in receipt of a copy of this work, called "Poultry for Profit," and has no hesitation in commending it to either the "backlotter" who keeps a few chicks for his own pleasure, to the fancier who works to the "standard," and to the commercial poultryman who makes a business of poultry culture.

Before its publication the manuscript of "Poultry for Profit" was submitted to practical poultrymen, to experts and simple poultry enthusiasts, and all agreed that it was more comprehensive, more readable and vastly more helpful than any similar poultry book yet published. It covers the widest range, discussing breeds, feeds, diseases, housing, marketing and answers the thousand and one questions that even the expert poultryman sometimes has to ask and the amateur is ever asking.

The new book is adequately illustrated, is handsomely printed and is altogether attractive. It comprises 225 pages and is published by the California Cultivator in Los Angeles. It sells for $1.—Riverside Press.

Tells why chicks die

E. J. Reefer, the poultry expert of 905 Main St., Kansas City, Mo., is giving away free a valuable book entitled "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

truth and laying plans to stock up with the kind that will show results.

This alarm that is being sounded to produce more feed for mankind is the poultryman's opportunity. He has the line of live stock with which he can meet the immediate demand.

We see everywhere the results of the continual hammering of the men enlisted in spreading educational propaganda. The American people are beginning to realize that the poultry business is on a surer basis than ever before and that a man can put his money into it with a better guarantee of success than in former years.

As we watch the trend of the poultry world we cannot help but feel that both fancier and farmer must pay more attention to the egg side of the work. The contests have served to put this feature prominently forward and they are creating a big demand for eggs from strains that can demonstrate ability to perform in the laying house as well as the show room.

Many are taking advantage of this great interest to stress the ability of their flocks to produce eggs when they do not measure up to a high laying standard. There will necessarily follow in the wake of this great interest, men who are willing to misrepresent but on the whole, this great awakening augurs well for the future.

We are of the opinion that the poultry work is getting down to a basis of other lines of farm work in a hurry. In fact, it has more promise than ever before of good earning power on the investment and will earn a safe labor income above the expense.

There are many who could develop suburban lots and others who could buy a suburban acre close to a car line and make a good income from poultry and still keep their regular business in town. Not every fellow who thinks he is called to give his entire time to the work really is, but many can get happiness and profit from poultry as a side line with small investment and not take the risks that a larger investment requires.

A TRAVELER'S VISIT TO AN EGYPTIAN HATCHERY

Here is an interesting bit from an article on the Nile, which first appeared in the Dublin Magazine, and was reprinted in Littells' Living Age, 1844:

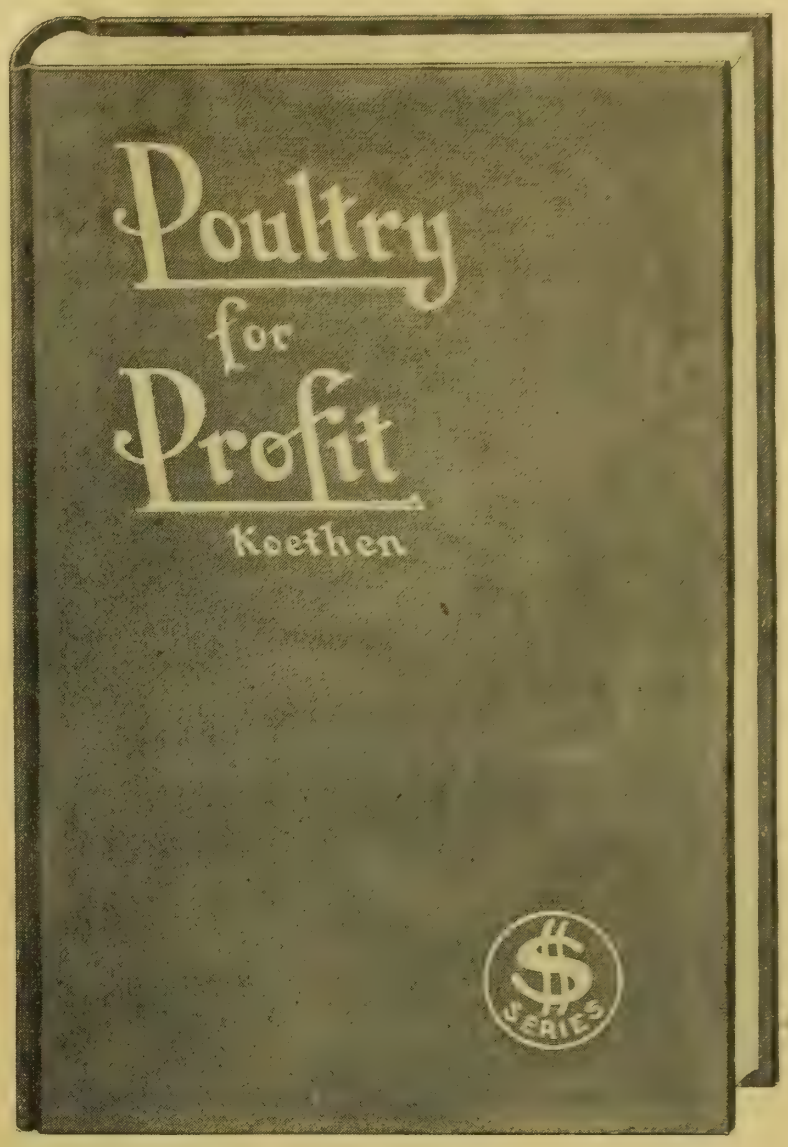
"One of the sights which amused me most was a chicken hatching oven. This useful establishment is at some distance from the walls (of Cairo), and gives life to some milions of chickens annually. It seems that the hens of Egypt are not given to sedentary occupations; having been hatched themselves by machinery, they do not feel called upon to hatch. They seem to consider that they have discharged every duty in society when they have produced the egg—no domestic anxiety ruffles their bosoms; they care not whether their offspring becomes a fowl or a fritter, a game cock or an omelette.

"We entered a gloomy and filthy hut in which a woman was squatting with a dark, little naked imp at her bosom. She sat sentry over a hole in the wall, and insisted clamorously on backsheesh (a bribe). Being satisfied in this particular, she consented 'to sit over,' and we introduced ourselves with considerable difficulty into a narrow passage, on either side of which were three chambers strown with fine mould and covered with eggs, among which a naked Egyptian walks delicately as Agag, and keeps continually turning them with most hen-like anxiety. The heat was about 100 degrees, the smell like that of Harrowgate water, and the floor was covered with egg shells and struggling chickens. The same heat is maintained day and night, and the same wretched hen man passes his life in turning eggs. His fee is one-half the receipt—he returns fifty chickens for every hundred eggs that he receives."

to make the

Poultry Business a Profitable Business

requires a thorough knowledge of the many details connected with Poultry Raising.



the Cultivator Poultry Book

Poultry for Profit

by

Jean A. Koethen, Graduate of University of California

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

An outline of its valuable information——

Making a Beginning	Housing and Yarding	Incubation
Brooding	Feeding	Breeding
Marketing	Sanitation and Hygiene	Fixtures, Conveniences
Diseases and Vices	Ducks and Geese	Turkeys

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

WANTED

We have parties that want farms and ranches improved and unimproved. If you want to sell or exchange your place list your property with us at once for quick results. Write for listing blank and other information. John E. Drendel Company, Inc., 212 Hearst Bldg., San Francisco.

Farms Wanted—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property free. American Investment Association, 12 Palace building, Minneapolis, Minn.

Wanted—To hear from owner of good farm for sale. Send cash price and description. D. F. Bush, Minneapolis, Minn.

Wanted—To hear from owner of good farm for sale. C. C. Buckingham, Houston, Texas.

"Don't worry. Fortune is a dame
You have to woo with smiles.
Whate'er her mood, you must not blame
Nor criticise her wiles.
Trust God in shadow and in sun,
And luck will come your way,
But never, since old Time begun,
Has worry won the day."

Frost—Do you think the auto has an ennobling influence? Snow—Well, speaking personally, we have been fined and refined.—Judge.

POTATO POINTERS

(Continued from Page 403)

grower who applied $50 worth of fertilizer per acre last year and sold his potatoes for $150 per acre more than he received for those grown in like soil not fertilized. In Great Britain and Germany whole potatoes are planted, as a cut surface favors fungous attack; small potatoes are also planted, but only from selected hills which had yielded a large product of the best quality. Also in Europe rather immature seed is favored, and time is gained by sprouting the tubers before planting.

Eelworm and Tuber Moth

This nematode and insect are also both enemies of the potato. Neither is as serious as is fusarium wilt or rhizoctonia. The eelworm is more harmful than the moth and is widely distributed, while the moth is not found except in California and to a limited extent in three or four other states. The nematode has attracted attention in California for only a few years, but the moth has been known for more than twenty years. Eelworms live for years and so are comparable to fusarium wilt and rhizoctonia as destructive soil agencies. They cause an uneven or mammillated surface on the tubers and darken the fleshy part, especially close to the peel. The roughened surface quickly reveals this affection, and eelworm potatoes should never be planted. The tuber moth bores through the tubers and blackens the tissue. Keeping the potatoes well covered during the entire growing season and removing all, even the smallest, from the field as soon as dry after digging should never be neglected. The potatoes should be placed at once in moth-tight sacks, as the moths continue to work after the potatoes are stored, and thus it is imperative to carefully guard against their presence in the sacks, pits, bins, boxes or cellars where the potatoes are stored. The solution of the tuber moth problem only requires great caution.

In order of damage from these several potato enemies we give the following: Fusarium wilt, rhizoctonia—a close second,—eelworm, tuber moth and potato scab.

Summary

1. Plant only on disease-free soil.
2. Plant none but clean, sound seed.

(a) That from hills of great production of best quality of tubers.

(b) That from hills where the vines were green and vigorous to maturity.

(c) That which is entirely smooth and perfect, showing no disease when cut.

3. Treat all seed with either formalin or corrosive sublimate just before planting.

4. Cut off a generous slice from the stem end of the tuber as the seed is planted.

5. Keep growing potatoes well covered; leave no tubers on the ground when dug, and sack, as soon as the tubers are dry after digging, in moth-proof sacks, this to protect against tuber moth.

6. Only plant perfectly smooth seed which will insure against eelworms.

If all of these points are observed, we shall secure a large production which will be in demand at top prices.

"Men who have had backbone have moved the world often before reaching the prime of life. Backbone means other men looking to you; the want of it, your looking to other men. Others may not believe in you, but that 'cuts but little ice,' it is when you do not believe in yourself."

THE MISCHIEF-LOVING CROW

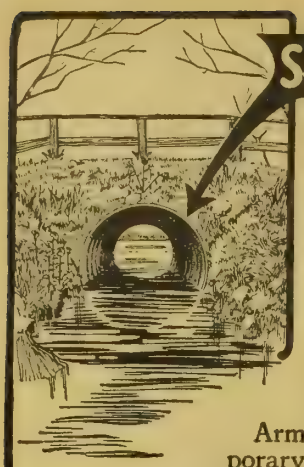
Writing of the many amusing characteristics of the crow, in Harper's, Walter Prichard Eaton tells of the annoying way in which a certain pet crow pestered a totally inoffensive dog and a lamb.

"It was curious to watch his instinct to hide things manifest itself in a hundred odd ways, to the human mind not in the least related to a food-supply. Any small object which was bright and shining particularly attracted him, and he would spend hours attempting to hide bits of broken crockery or glass in the dog's fur or in his ear. Don's ear was a favorite hiding place. Jim would get a bit of crockery in his beak, hop upon the dog's head, drop it neatly into his ear, and then carefully fold the earflap down over the aperture. If Don objected and raised his ear again, Jim would once more grab it and fold it down scolding meanwhile. If Don were wide awake he did not seem to mind this performance in the least, but if he chanced to be sleepy he would get up with a bored air, shake out the crockery from his ear, and with the look of one who says, 'For Heaven's sake, why can't they leave me in peace!' walk away to some other place. Nothing discouraged, Jim would slowly follow along behind him, keeping an eye cocked meanwhile for a fresh bit of shiny stuff (even a bright pebble would do), and, when Don once more lay down, the entire operation would be repeated.

"One could never be certain at these times how far Jim's actions were purely teleological—the exercise in captivity of instincts upon which the endurance of the wild species depends—and how far there was mingled with them an almost human love of teasing. For Jim unquestionably loved to tease. Of that there could no doubt. He knew, too, just as a dog knows, who could be teased and who couldn't. There were two lambs on the place, one a stolid creature, and the one of totally different temperament, highly excitable, in fact, Jim discovered the difference after a single trial. As they were frisking about one day he lit first on the back of one and then on the back of the other, sinking his claws into the wool with a good grip, flapping his wings, and cawing delightedly. One lamb paid no attention to him, but the other immediately took fright and began to buck like a bronco, or rather an animated sawhorse, and then to cavort about the pasture lot. Thereafter Jim confined his attentions entirely to her. He never tried to ride the other lamb, but again and again he would pounce down suddenly upon the poor timid one's back, set up a great flapping and cawing, and speedily enjoy a free ride over a goodly portion of the surrounding landscape."

PROLIFICACY OF POLAND-CHINAS

The Standard Poland-China Record Association resents the statement sometimes made that the Poland-China is not a prolific breed. A circular of the association says: "Upon inquiry to nearly 100 breeders of this breed, asking for the average number of pigs farrowed per sow, in their herd, for a term of three years, the average was 9¾ pigs per sow. One herd had an average of 9¾ for a term of five years, from 40 head. Another had an average of 10 pigs from 25 sows for a term of five years. Others for terms of three and four years, gave averages of 8½ to 10, with high litters of 15 to 18 pigs. This is a good performance, when it is considered that many of the sows making the above averages were just gilts with their first litters."



Safer and Cheaper than Bridges

THE small bridge on a public highway is often a menace to life and limb. It is a source of constant worry and expense. The heavy traffic to which modern roads are subjected is likely to cause the total collapse of an ordinary bridge, blocking travel and entailing damage suits.

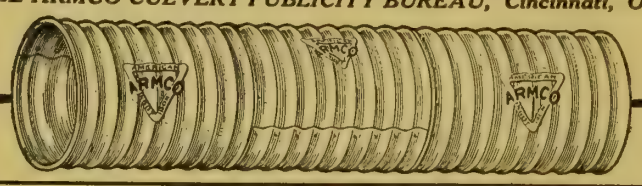
Armco Culverts do away with the use of temporary or uncertain material for culverts and small bridges, cut out the heavy maintenance costs and make travel safe and sure at all seasons and under all conditions. They withstand the floods of spring and the ice of winter. Properly installed they last for immensely long periods without need of repairs or attention.

ARMCO AMERICAN INGOT IRON CULVERTS

resist rust because made of a pure iron, almost wholly free from those foreign substances that cause steel and ordinary iron to rust out and go to pieces. They possess great strength and are tough enough to stand the strain of shifting and settling foundations.

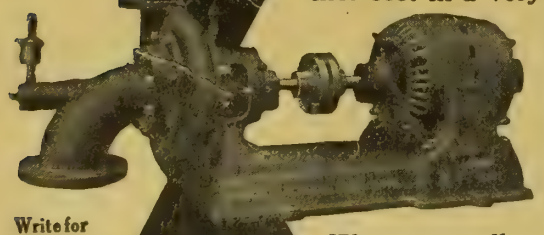
When the drainage problem in your community comes up for consideration, insist on the elimination of troublesome and dangerous bridges and throw the weight of your influence on the side of Armco Culverts. See the Triangle Brand on every section.

There is a manufacturer in your vicinity. Write him or
THE ARMCO CULVERT PUBLICITY BUREAU, Cincinnati, Ohio



"Jackson MADE"

The pump you buy should raise the maximum quantity at the lowest cost per gallon, run constantly without repairs and with the minimum attention. "Jackson-Made" Pumps not only do this, but they are Self Payers because their saving in power and repairs will pay their first cost in a very few months.



There is a "Jackson-Made" Pump that will do the work you require at lower cost than other makes.

Write for Catalog 48A

Write us, tell us your pumping problem—our expert engineers, without cost to you, will help you.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Double Insurance

The agent of our local farmers' mutual fire insurance company is agent for a similar company of an adjoining county. When the risk offered exceeds the limit of the local company he places part of it in the other. Both policies have a clause stating "if any other insurance, whether valid or not is carried upon the property without a special agreement in writing upon the policy or attached thereto, the policy shall at once become void." The agent is entirely disregarding this clause and writing policies in both companies upon the same piece of property without any permits for the double insurance, claiming that it is unnecessary. Does this jeopardize the value of these policies? Could the insurance company compel the payment of assessments against a person holding such policies?

The clause stated is one contained in the standard insurance policy of California and means exactly what it says. In case of fire upon your place it is very probable that any stockholder of either of the companies could restrain payment of loss for breach of the condition of the policy, and therefore it behooves you to see that the agreement for additional insurance is endorsed thereon. In fact it is exceedingly doubtful if a county fire insurance company could take additional or double insurance in this way. As this clause states that the policy is void it is doubtless true that you could not be compelled to pay assessments.

Roadway

I have a homestead and the road has been changed a number of times and now goes across the corner of my field. I got the consent of all the neighbors who use the road to let me plow it up and fence my field. I made a good road around my field (the new road I made is still on my land), the neighbors are all satisfied to go the new road, but one. He said if I didn't put in gates he would cut the wires, and now he won't shut the gates and he tries to get the other neighbors to go through with him.

Unless the road has been legally declared or your neighbor has obtained rights by prescription to the old road, he is a mere tresspasser and you can deal with him as you would with any trespasser.

Laborer Injured

A farm laborer was injured by mowing machine six months ago. Employer paid surgeon's and nurse's bills. Is he further liable under the compensation act, or rather outside of it, for the farm employer is exempt under the provision of that act. Has the commission power over this case? Lawyer for injured man threatens to bring suit. Would it be better to settle if nominal sum will do it?—Subscriber, Ontario.

The employer is not liable for damages suffered by the employee in consequence of the ordinary risks of business in which he is employed or negligence of another employee, unless the negligence was committed in the performance of the duty employer owes by law to the employee or unless the employee causing the negligence was incompetent. The employer is liable, however, when the injury results from the wrongful act or neglect of his foreman having a right to direct the services of the injured employee. The workman's compensation act does not apply to farm labor. The amount which the laborer would be entitled to recover would be entirely within the discretion of the jury and would not be limited merely to surgeons or nurses bills. As none of the facts which give rise to the injury are stated, it is impossible to give futher advice.

Bitten by Dog

If a neighbor's dog on his own land bites you what can be done to the dog? Can you be prevented from killing the dog?—Subscriber, Lower Lake.

A dog may be killed only when actually engaged in mischief. It makes no difference where he bites you, one has no right to kill the dog after the bite. Your only action is a civil one against the owner of the dog for damages caused. The owner of the dog has a right to have dogs upon his premises for the protection of his home and property.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Anonymous

We are receiving so many unsigned letters and the department is becoming so filled that there must be some reduction, therefore we are again compelled to announce that anonymous communications will not be given attention. As soon as a letter is opened the signature is looked for, and if not found—no matter how helpful a question it may be—the waste basket will get it. This is an invariable rule and yet there is scarcely a day that unsigned letters are not received at the office. In some cases these letters have the full address of the writer on the envelope, and it is possible the envelope has been thrown away before this fact is observed, so it is best always, in addition to putting the name on the envelope, to attach it to the letter. We scarcely ever use the name, and certainly will not when it is indicated that name should be withheld.

Again, subscribers will send remittances in a letter and on the same sheet ask a question intended for the editorial department. It will expedite matters if the question or matter intended for the editorial department is written on a separate sheet with full name and address on it. It will then receive immediate attention.

Vomiting from Overfeeding

What shall we do for a calf two months old which has been having as feed a gallon and a half of milk and two tablespoons of calf meal night and morning? It runs in green pasture in daytime and is fed hay at night, and after feeding vomits the milk. It is rather stupid with ears dropped down. It seems to have had too much to eat and drink.—Subscriber, Soledad.

It is rather uncommon for the larger breeds of animals to vomit but they do sometimes. It is occasioned by overfeeding. Reduce the feed by cutting out some of the kinds, either the green pasture or the hay. Mix one ounce of turpentine and eight ounces of raw linseed oil and give a large tablespoon of this morning and evening.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Cottonseed

Is cottonseed good food for hogs and horses?—Subscriber, Imperial.

Experience in the southern cotton states shows cottonseed meal to be a good feed for horses. Two pounds per day seems to be the maximum amount fed in experiments reported at Iowa station. One and one-tenth pounds of cottonseed meal per head daily was as effective in maintaining the horses in good condition as 1.4 pounds of linseed oil meal. The cottonseed meal was fed in combination with corn and oats. Cottonseed meal has the highest proportion of protein of any of our feeds. Alfalfa is also rich in protein. Hence cottonseed meal should not be fed with alfalfa alone. It goes well with grain hay or sorghum or maize fodder if you are feeding such to your horses in Imperial. Some horses do not relish the meal and it may be necessary to mix it well with rolled barley or chopped alfalfa to get them to eat it.

"For hogs, cottonseed meal is not considered a good feed. Experience has shown that they may thrive on it for a while but usually in from four to six weeks some die. Not all die, but enough to remove profits. The Oklahoma station reports an experiment in feeding a grain ration of one-fifth cottonseed meal and four-fifths corn meal in which one-fourth to one-half the pigs died in five to seven weeks. Henry says that "if cottonseed meal is not fed continuously for over 40 days and does not form over one-fourth of the ration, and if the pigs are freely supplied with green forage or grazed on pasture, the risk from this feed is slight."

"Let us hear from Imperial Valley farmers as to their experience in feeding cottonseed products to different kinds of stock.—L. A."

Ration for Sows

My sows have to be shut up without green feed. Which is best for them, maize and water, or milk?—Subscriber, Imperial.

By maize, we presume the subscriber means milo of the dwarf variety which is so largely grown in Imperial. Milo seed has a comopsition somewhat similar to that of Indian corn and a similar, though not equal fattening value. Hence much of it should not be fed to sows that are soon to farrow unless they be very thin in flesh. It sounds rather strange to hear one say green feed is not available in Imperial Valley. If pasture is not at hand for the sows to range on, is it not possible to cut the alfalfa and feed to them green? Succulant food is necessary for best results with pregnant sows and nothing is superior to green alfalfa. If sows are in good flesh alfalfa pasture frequently furnishes them with all the nourishment required.

If it is convenient to cut alfalfa hay finely a good mixture would be for a daily ration for each sow, one quart milo seed, two quarts chopped alfalfa and five quarts of milk. Soak the milo and alfalfa for 12 hours in the milk before feeding. If chopped alfalfa hay is not available feed milo and milk together and keep alfalfa hay where the sows can get at it any time they choose. One quart of milo seed is suggested if the sows are in good or fair flesh. If thin it might be increased by one-half until the sows improve. Beside the above mixture the sows will want water to drink.—L. A.

Callas Not Blooming

My callas do not bloom out full. The bulbs came from a bed which has always given satisfactory bloom. The bloom stalks which come up do not bloom out.—Subscriber, Gridley.

It is almost impossible to recommend treatment in a case like this where particulars are not given. For instance, it is possible that just prior to blooming time the moisture may have been withheld and this prevented the plants giving best results. The calla demands a large amount of moisture. Of course it is barely possible that the roots may be surrounded with exceptionally hard soil. Certainly the shady location is ideal unless the roots of the live oak tree continually sap the ground of moisture and nourishment.

Castor Beans

An inquirer wishes information as to the growing of castor beans in California and the possibilities of profit from their culture. We would not recommend any extensive planting of this crop. We know the effort was made some years ago to establish mills for crushing and extracting castor oil, but the price which the mills were able to pay did not justify the gathering of the seed. The plant at that time grew wild, as it does now, in immense quantities along the Santa Ana river and elsewhere. If there was a market for the beans they would be a very satisfactory crop for the plant grows almost spontaneously in nearly all sections of California and its culture is very simple.

Fertility of Eggs

How many hens should be run with one Plymouth Rock rooster to secure highest fertility?—Subscriber, Gridley.

Eight hens is as many as it is usually considered safe to run with a male of one of the heavy breeds, but one male will sometimes care for 12 or even more. Much depends on the age and physical condition of the birds. Again, the eggs may be fertile and yet not hatch well. I never hatched a larger per cent of chicks than one spring when I ran 12 hens with a yearling cock. This spring, hatching from a pen of seven pullets mated to a young cock I find the fertility good, but the hatchability poor, a condition which I explain by the fact that the hens are too young and have been laying heavily all winter. A male will care for more hens in the spring than in the fall or winter. In the fall four hens is sufficient for best results. Overfat hens rarely lay many fertile eggs, and favoritism plays no small part in securing fertility. The only way to be sure of the fertility and

hatchability of your eggs is to try them and then to remedy whatever conditions seem to be wrong.—J. A. K.

Comment

Mr. G. A. Leach of Pasadena refers to a recommendation made by Dr. Petrie regarding curing of thrush or canker. He thinks a less objectionable and more effective treatment is secured by soaking the horse's feet in hot and cold water. Also, in the treatment of sticktight fleas he would use carbolated vaseline instead of corrosive sublimate, as recommended by Mrs. Koethen.

Unsigned

A subscriber at Morgan Hill sent a communication to the veterinary department which was unsigned. If he will rewrite his request and sign it it will receive as prompt attention as we can give.

Other inquirers as to copyright and other questions should repeat and sign letters.

To Poison Blackbirds

Why not soak some maize in blue vitriol as they used to bluestone wheat in the East? Then let each farmer take his box of poisoned corn to the tules in the river beds. As there are no other birds stay in the tules I don't think any damage would be done?—A. G., Brawley.

In feeding the skim milk, the greatest danger lies in overfeeding the calf. Five or six quarts a day is all that a calf should have until it is three or four weeks old.

CONCRETE FLOORS

Too much care cannot be exercised in preparing the foundation for a concrete floor. This should always be well drained and firmed, to a depth of from six to eight inches below the concrete.

At the Colorado Agricultural College we find that it pays to thoroughly tamp this foundation before putting on the mixture. If the soil contains a great deal of clay, it may be necessary to remove part of it and to fill in with broken stone, gravel, or cinders to within four or six inches of the proposed finished surface, depending on the thickness of the floor. Blind drains of coarse gravel or tile may be laid from the lowest points in the excavation to carry off any water that may accumulate beneath the structure.

For the construction of the ordinary stable or barn floor, which is not to carry any great weight, the following proportion is to be recommended for the concrete base: 1 part cement, 2½ parts clean, sharp sand, and 5 parts of loose gravel or broken stone. This should be finished on the surface with a 1 to 1½ inch layer of a mixture of 1 part cement and 1½ to 2 parts of clean, sharp sand. The total thickness of this floor must be from 5 to 8 inches, depending upon the load it has to carry.

For engine foundations, floors or driveways over which heavy loads pass, the following proportion is to be recommended: One part cement, two parts sand and four parts broken stone or gravel.

For all large floors it is advisable to place the concrete in sections not to exceed six feet square. This may be done by placing a two-inch plank of a width equal to the desired thickness of the floor on edge as a box in which the concrete is tamped until water begins to show on top. Make several of these forms, holding the plank in place by means of stakes driven into the under surface. These stakes should be driven on the outside of the form so they may be easily removed after the concrete has set and the planks have been taken out. Fill alternate forms at first, tamping the concrete thoroughly, especially the edges. On the same day, as soon as the concrete has set, remove the crosswise plank and fill in the forms not filled at first. Mark the side plank to show exactly where the points come.

The finishing coat should be spread on before the concrete has set. To make this of uniform thickness it is best to place either one or one and one-half inch wood strips, as desired, on top of the concrete over which a straight edge may be run. Smooth with a trowel for a smooth surface, or with a wooden float for a rough surface. Groove exactly over the joints of the concrete so as to bevel the edges of the block.

Do not trowel the surface too much until it has begun to stiffen, as it tends to separate the cement from the sand and injures the wearing surface.

The floor should be constructed with slope enough to carry all liquids to certain points from which it may be drained.

Protect the new floor from the direct rays of the sun, currents of air and frost, and keep constantly moistened for several days. Water is very important in the curing of concrete constructions and must be used liberally.

Use nothing but the best cement that can be obtained. The sand should be clean, sharp and not fine; it should be free from loam or clay, as these will tend to destroy the adhesive quality and retard the setting of the cement. Use clean, pure water for mixing. Mix thoroughly. Tamp thoroughly. Water thoroughly. —H. M. Bainer, Professor Farm Mechanics, Colorado Agricultural College, Fort Collins.

Say, what's the use o' bein' a kid,
An' mamma's treasure, an' sich as that,
When all the cookies an' things is hid,
An' her a sayin' they're hid from the cat?

USE CARE IN BUYING SUDAN

Horticultural Commissioner F. W. Waite of Imperial County is issuing to his people warning regarding the purchase of Sudan grass seed. He writes us that his action is because of Sudan and Johnson grass being so closely allied, especially as to the seed, that he fears where it may have been grown near to Johnson grass there is danger of hybridizing and possibly introducing a pest. From his warning we quote:

"The United States department of agriculture says that Sudan grass is a drouth resistant hay plant, that demand for information has come from all sections, but more especially from Southern states where the need of a desirable hay grass has been acute since the advent of the boll weevil forced diversification of crops. I wish to call attention to the fact that Sudan grass resembles Johnson grass in all ways excepting root system, and the fact that they belong to the same family as our milos makes it a question whether its use will be advantageous enough to overcome the risk of Johnson grass being introduced. All the sorghums hybridize very readily, making it very easy to cross Sudan grass with Johnson grass should there be the least mixture of seed used, and the same is allowed to blossom.

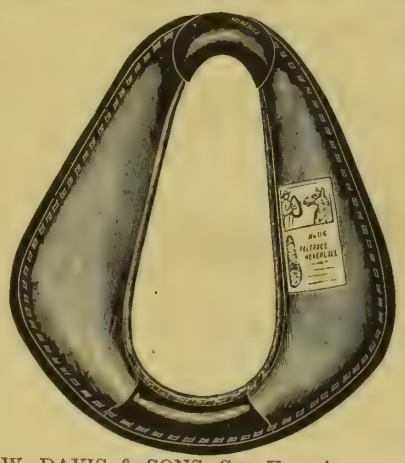
"The seed looks the same and will require expert examination to prove that Sudan grass seed is not Johnson grass seed.

"With all the other sorghums and alfalfa doing so well in the valley and plenty of water it is a question if Sudan is needed."

BAD ODORS DON'T CAUSE DISEASE

"That certain strong smells kill disease is as ridiculous as the belief that certain strong smells produce typhoid or smallpox," says Dr. H. W. Hill of the Minnesota Public Health Association. "Goats are often kept about stables to drive away glanders. The strong smell of the goat, it is believed by some, disgusts the glanders germ! On a par with this absurd superstition is the story, heard from time to time, that onions ward off smallpox. Our forefathers had a profound faith in asafetida, because of its evil smell, and a century ago hardly a prescription was compounded without the addition of this harmless and usually wholly inert gum. We have learned something in the last century or so however, and no longer dread bad odors as causes of disease, nor trust to them as cures. It is a curious fact that many of the most deadly gases have little or no odor, or a far from unpleasant one, while many vile smelling gases are comparatively harmless."

SORE SHOULDER INSURANCE



If you could get insurance against your horses becoming sore-shouldered when most needed, you would take it at any reasonable price.
Why not take it FREE by using
W. DAVIS & SONS'
Horse Collars
"Felt-Face" .....each $5.00
"Cushion" Collars.....each 3.00

This "Cushion" Collar is a combination of leather and canvas, guaranteed to cure sore shoulders and "stand the racket."

The "Felt-face" collar is all-leather, first-quality of oak-tannage, hand-thonged throughout. It has a facing of felt under the leather face, producing a soft yet firm surface against which the animal pulls.

It is natural for any manufacturer to say that his collars are "the best," but it is only about "FELT-FACE" collars that letters like this are written:

W. DAVIS & SONS, San Francisco.
Gentlemen:—I sold the Red Bands Orchard Co. two Felt-face collars about a month ago for two sore-neck mules which are all healed up now. They came in today and ordered one dozen. Please send me soon as possible 1½ dozen, from 17 to 22-inch. Very truly,

NOW IS CHRIST RISEN

By Nancy Byrd Turner

Now is Christ risen from the dead!
Now brightening from sea to sea,
The wistful land is garmented
In ancient beauty wondrously.
Here flaunts a vine, here shakes a horn,
Here rings a blossom's fragile bell.
Here buds a rod, 'twixt night and morn,
Like Aaron's miracle.
So deep the heart of earth is stirred,
Far down, its humblest hoarded seed
Thrills to the echo of the word
That Christ is risen indeed.

How should a violet lift its face,
Safe resurrected, perfect, fair,
And He who fashioned all that grace
Lie dust beneath it there?
How should a trembling tendril stir,
A slender sword-thrust cleave the sod,
And He bide in a sepulcher—
Their Lord and God?
Nay, but an age ago unfurled
One dawn, from out a rock strong riven,
In an old garden of the world
The white, white Flower of Heaven!

O ye who mourn, new graves beside,
That same deliverance shall be
For them, our last great Eastertide,
That shook the slope of Calvary.
O ye who doubt nor understand,
Who see the guarded tomb alone,
For but a prayer an angel's hand
Will roll away the stone.
O ye who know, the dark is fled,
The day is on the hills again;
Since Christ has risen from the dead
There is no death! Amen!

THE BELLS OF ST. MARK'S

By Evelyn Snead Barnett

"IT'S a pretty old bell," the senior warden remarked at last.

"It's jes' sixty years old next Sad'dy," promptly responded Uncle Horace.

"You have a good memory," Mr. Atmore said.

The sexton ignored the remark. "Yes," he continued, "sixty years old next Sad'dy. I was thar when they cast her. You were thar, too, Mr. Hunt—yo' pa had you by the hand, and you wa'n't more'n knee-high to a buck. It was at Hurter's foundry—that's gone long ago. We were all notified that they was ready to cast the bell, and we went to see it done. The big kittle was jes' on a level with the flo', and we all crowded roun' it—the furnace, you unnerstan', was down in the cellar. It was gittin' dark and we thought they'd never be ready. Then the foreman he say sump'n to Doctor Hamerton, and the doctor felt in his pockets, and took out a big handful of silver and throwed it into the redhot kettle. Then every last one did jes' the same. And I,—even in those days they was beginnin' to call me miser 'cause I tried to save—as I was a darky, I came last, and they were all a-lookin' at me, and my father was goin' to quit bein' sexton on account of the misery in his legs, so I jes' took every cent I had 'bout my clothes, and in it went. There's nothing wrong with the bell, gentlemen," Then turning to Mr. Atmore, he added, fiercely, "She may not be the latest fashion, but she rings clear, 'cause she's got a heap of silver in her, and she's a sight better than the tinklers they make nowadays."

Then the old fellow strode from the room; and although it was fully quarter of an hour too soon to begin ringing for afternoon service, he pulled the bell so vigorously that little Mr. Griener, in his shop on the other side of the street, ran out to see where the fire was.

But in the very midst of its protesting clamor, the new again triumphed over the old, and the bell was condemned.

On Easter morning the new bells were to be heard for the first time. They had been tested singly and softly, but had never been permitted to show their real merits. A crowd gathered early on the sidewalk and in the church to hear them.

When the hands of a neighboring clock pointed to a quarter of eleven, the crowd ceased talking and gazed upward. Punctually the bells began. They were indescribably sweet, but plaintive—almost sad. In one clear stroke the smallest bell sent a challenge to the middle bell that was returned in notes of mellow harmony, while the big bell purred a low-toned accompaniment.

It was fine, but it was not satisfying. Mrs. Bonner, an invalid, listening only a square away, wondered that she could not hear. Mr. Poak, who was waiting for the bells to summon him to church, continued to read his book until it was too late to go. Mr. Chauncey told his wife that since it was after eleven o'clock, she could take the cotton from her ears and open the windows; if the bells had rung, they must have stopped by that time. "Why didn't the bells ring?" was a question that many persons asked one another.

Inside the church, a decorous murmur went up from the congregation after the first few notes. When the service was over, many of the members expressed dissatisfaction. Horace alone blinked his owl-like eyes and smiled in undisguised pleasure.

"Natur'ly," he said, "ef they put a organ up in the sky they can't expect people down on the earf to hear it."

Hardly had the last member of the congregation left the church before he locked the doors and was off. During the afternoon Mr. Greiner, standing in the doorway of his shop on the other side of the street, saw a heavy wagon with a covered load drive into the alley on the north side of the church.

"There's the boss rigger from Hefty's with two of his men and tools!" he called to his wife in the back room. "Maybe they're trying to find out what's wrong with the bells before evening service."

When night fell, Uncle Horace was nowhere to be found. His nephew, who came to take his place, reported that his uncle had felt badly at not having a bell to ring,—the first Easter for sixty years,—and had gone to visit some relatives in the country.

No crowd gathered as in the morning. A solitary workman in his shirtsleeves stood on the curb, and two boys teased a cat in the alley. The policeman came up, glanced at the church, then went on. Inside the church there were only a few young couples.

The bells began as prettily as before—the sweet silver-throated bell,

Ants in the Pantry?

Do Not Suffer From This Annoyance any Longer

Many women suffer all kinds of annoyance from a house overrun with ants, believing there is no relief available, because they have tried various remedies without success.

All such women will be interested to know that certain and quick relief from this annoying pest is now at their disposal. A baker and candymaker in Los Angeles—driven almost to distraction by a store overrun with ants—prepared a paste which seems to have almost supernatural powers in dealing with these aggravating insects. It rid his entire shop of ants in one day; indeed, so successful did it prove that it was deemed advisable to place it upon the market for general use, in order to supply the widespread demand which was almost immediately created.

It is put up under the name of Kellogg's Ant Paste and can be obtained at all good druggists. Try a package today, and your ant troubles will be a thing of the past.

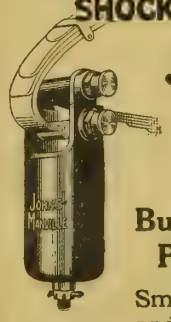
JOHNS-MANVILLE SHOCK ABSORBER



$15

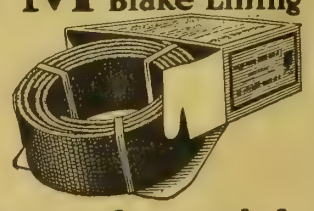
PER PAIR

Built Right and Priced Right

Smooths out the ruts and bumps in every road. Does away with the vibrations which shorten the life of every automobile part. A *real* shock absorber in performance as well as in name.

Fits any spring up to 2¼" wide. Adjustable to any weight of car. Attachment simple—no special knowledge or special tools required. Supplied with spring perch for attaching to Ford cars.

J-M Non-Burn Brake Lining



Economy Commends It Safety Demands It

Over half a century's specialization in Asbestos products has taught us how to make good brake lining.

And by this we mean brake lining that not only insures *safety* by proving dependable in every emergency, but also economy because it outlasts ordinary lining.

J-M Non-Burn Brake Lining is made from pure, long-fibred Canadian Asbestos, tightly woven and reinforced by strong brass wire. It will not burn on the steepest, longest down-hill grade. It is impervious to water, oil and gasoline.

Sold in cartons containing cut pieces of exact size for the brake bands of all popular makes of cars.

If your dealer can not supply you, write us direct. Send for Booklets.

the tuneful middle bell, and the big bell with its low-toned bass. After a pause they repeated this harmony.

Then something happened!

A smile of recognition lighted Mrs. Bonner's pale face. She raised her head from the pillow and asked for her prayer-book, in order that she might follow the service. Mr. Poak laid down his book, seized his hat, and was off. Old Mr. Chauncey, who had not been to church in six weeks, called to his wife to know why she was keeping him waiting. Mrs. Chauncey, tying on her bonnet as she ran, had hard work to keep up with him.

From all quarters they came. The young minister, who from the door of the vestry-room had gazed with a sinking heart at the sparse congregation, looked at first puzzled, then amazed.

Wonderful to relate, the old bell that had been sold for scrap-metal, and that he thought had long ago been melted up, was ringing!

The new bells were still at work. Again little silver-throat made itself heard; then the tuneful middle and finally the humming bass. But instead of the expected pause, there sounded the loud boom of the old bell. And that sound changed the whole character of the ringing. It made it continuous, it made it cheerful, and by a strange coincidence, the note of the old bell was in perfect harmony with the three new ones.

On the stone flagging the people were swarming; their faces were filled with astonishment and awe. Some showed superstitious terror. The Pied Piper himself could not have been more exigent than the old bell was. The workman in his shirt-sleeves regarded each new arrival with interest, and chuckled quietly.

The minister called for a lantern, and with two of the church wardens, mounted to the tower. The three new bells were there—no more. Since the regular boom now seemed to come from the earth, the men went down into the basement. They found nothing. When they came up and went outdoors, others joined them, and with the rector leading, and the grinning workman bringing up the rear, the crowd started round the building. Down the alley they passed, through the side gates and into a small rectangular piece of ground between the wings of the church and the Sunday-School Chapel. There the mystery was solved.

An Easter moon just one day past the full showed Uncle Horace pulling vigorously at a thick rope. At the end of the rope, suspended from a double trestle about five feet high, was the old bell. Garlands from the morning celebration festooned its brim; streamers of ribbon fluttered from the hanger; some of the banners with faded text were planted at the sides, and along the crosspieces of rough timber a row of candles flickered.

The old man nodded casually to his visitors, and continued to ring as if the action were an every-day occurrence. But his air of unconcern was short-lived; the new bells ceased ringing, and he found himself performing a solo before an unusual audience. It was then that his composure fled. Uncle Horace climbed stiffly from the ladder, approached the still vibrating bell, and laid his old gray head against it. His eyes filled with tears, but he was defiant.

"Gen'l'mun," he said, "it's my bell now—I bought her, and nobody da's-en't take her away from me. And what's mo', when I want to ring her—she'll ring."

Evidently the crowd was in sympathy with him, for there were murmurs of assent. The minister himself showed by his look that at last he realized that a church-bell could be more than a thousand pounds of metal. He walked up to the old sexton and laid a friendly hand upon his shoulder.

"Well, Horace," said he, "it seems you have discovered what ails the new bells—something lacking in the way of balast—eh?"

The old man brushed his sleeve across his eyes. "She ain't in nobody's way, doctor," he said, pleadingly. "You won't make me move her?"

Mr. Swing was not a man to do things by halves. "No," he said, "now that she is here, she can stay; moreover, she must ring. Since you have things so conveniently arranged, I think you will have to divide the service with

Timely Advice to Mothers

For Children's Lunch

All healthy children require something to eat now and then between meals. The careful mother, solicitous for her little one's health, shrinks from giving them too much cake, cookies, and similar dainties which most children appear to like best. The most satisfactory substitute—one that is thoroughly wholesome and nourishing—is good home-made bread thickly spread with Karo Syrup. Nothing can take the place of Karo for this purpose. It is clear and sweet as honey, without the cloying quality which makes honey distasteful to some, and unwholesome if eaten freely. You can give the little tots Karo spread thick on bread without the slightest hesitation. They will not only relish it keenly, but will actually thrive upon it.

You can also use it as an accompaniment for waffles and griddle cakes, as well as in the preparation of puddings and gingerbread, while the candies made from it are pure and delicious.

If you have not yet tried Karo Syrup, order some from your grocer today and make the children happy—just as thousands of other mothers are doing all over the country. Insist, however, upon Karo—it costs no more than ordinary syrups, and is superior in every way.

Learn Trap-Shooting

THE sport for farmers, their wives, sons, and daughters. Every farmer has a shotgun, but few are good shots. Every woman should know how to use a gun for the protection of herself and her home.

Trapshooting at clay targets solves both problems and provides no end of outdoor sport.

the new bells—in fact, you had better do all the work until they are doctored. Do you agree with me, friends?"

The assent was unanimous. Afterward, the crowd pressed round Uncle Horace to congratulate him, and to examine the bell. When at last they had all gone to attend the tardy service, the old man spied the workman in the shirt-sleeves.

"Boss," he said, "I sho'ly is obleeged ter you. You done a good job—her bolts is as tight and she sets as steady as if yo'd had a month's notice for puttin' her up."

The rigger grinned. "I kind of guessed you couldn't bear to give up the bell by the way you kept hanging round the foundry, asking questions. But you've come out better than I thought you would."

"I knowed what I was about," replied the old man, with a twinkle in his eye. "Jes' let me give you a piece of good advice, boss: The best way to break a young colt is to drive him with a old horse."—Youths Companion

EASTER LUNCHEON

Written for California Cultivator
By Isabel Cottle

Color Scheme—Yellow and White

Daffodils or yellow tulips, with ferns may be used for flowers, or even the wild yellow mustard is graceful and sunny. A pretty effect is secured by using yellow crepe paper under lace doilies. Tiny yellow chickens for favors, each holding in its bill an egg-shaped place card painted in yellow and white, are effective.

Menu

Mint Cocktail
Chicken Croquettes with Mushroom Sauce
Bird's-nest Salad Finger Rolls
Angel Parfait in Rolled Vanilla Wafers
White and Sunshine Cake
Candy Eggs
Coffee

Chicken Croquettes

To one and one-half cups thick, white sauce (six tablespoons flour, four tablespoons butter, one and one-half cups liquid), add three cups chopped cold-cooked chicken, three-fourths teaspoon salt, one-half teaspoon celery salt, speck cayenne pepper, two teaspoons lemon juice, and if desired, a few drops onion juice. Mix well, set in the refrigerator until very cold, then mould with the aid of a chicken croquette mould into tiny chickens. Egg and crumb and fry in hot fat. Veal may be used in place of chicken if desired.

Mushroom Sauce

Make two cups medium white sauce (four tablespoons flour, four tablespoons butter, two cups liquid), using part cream and part chicken stock. To this add two cans of the button mushrooms. Season well and just before serving add one tablespoon minced parsley.

Finger Rolls

Mix and sift twice one quart flour, two tablespoons sugar, one teaspoon salt and three tablespoons baking powder. Cut in one-fourth cup shortening, mix to a soft dough, using about one and one-half cups equal parts milk and water. Toss onto a floured board. With the back of the spoon pat it out to about one inch in thickness, taking care that there is no flour on the top of the dough. Soften four tablespoons butter, cut into small pieces, spread on the top and press into the dough. Fold one-half over the other and pat out to about one-half inch in thickness. Cut into strips three inches long and about one-half wide, and bake in a hot oven.

Bird's-Nest Salad

Color Neufchatel or cottage cheese a delicate green with green coloring paste. Mould into the shape of robins' eggs and lay in a nest of shredded lettuce, three to a serving. Sprinkle with coarse black pepper and serve with French dressing.

Angel Parfait

Boil together one cup sugar and one-half cup water until it threads. Beat the whites of three eggs until stiff and dry, adding one-half teaspoon cream of tartar when the eggs are foamy. Pour the syrup slowly onto the whites of the eggs and continue beating until cold. Add one tablespoon vanilla and one pint heavy cream, whipped stiff. Put into moulds and let stand for three hours, packed in equal portions of salt and chopped ice.

For an attractive way of serving the above make vanilla wafers, roll as cornucopias, fill with the parfait and lay on a dessert plate with a daffodil beside it.

Rolled Vanilla Wafers

Cream one-fourth cup butter, add gradually one-half cup powdered sugar and cream in one-fourth cup milk, adding a few drops at a time. The mixture should be smooth and creamy. If it seems to curdle too much milk has been added at a time. By beating well it will become smooth again. Then add seven-eighths cup bread flour and one-half teaspoon vanilla. Spread the mixture very thinly on an inverted buttered dripping pan, smoothing with a broad-bladed knife or spatula. Mark in three-inch squares and bake in a slow oven until delicately browned. When done draw the pan to the front of the oven and with a sharp-pointed knife run along the crease, separating each wafer. With the point of the knife raise the edge of each wafer and roll either in cornucopias or cylinders, cornerwise or straight across. This must be done while the wafers are very hot, otherwise they will be too brittle. If they become brittle while handling put back in the oven and reheat. Have the knife and plate ready to hand so that not a moment will be lost after the process of rolling has begun. It may seem difficult at first to handle the hot wafers but with a little practice it will become easy.

Various Uses for Cornstarch

Interesting Facts Regarding This Delicious Food Product

The average housekeeper would be greatly surprised at the wide range of uses developed for cornstarch in the preparation of various foods and delicacies. In fact, it has become an indispensable adjunct to present day cooking. Every housekeeper, therefore, should become thoroughly familiar with its use.

For instance, in making pastry, cakes, etc., by simply adding cornstarch to her regular bread flour in the proportion of one part cornstarch to three to five parts flour (according to the amount of gluten in the bread flour she is using) the housewife can prepare a pastry flour of the finest quality—one which will insure a soft, fine texture to the pastry, and eliminate the tendency to toughness prevailing where straight wheat flour is used.

Most pleasing results can also be obtained by using cornstarch in the making of custards, shortcakes, waffles, chocolate eclairs, and dozens of other delicacies—but to insure the results desired, it is absolutely essential that the best quality of cornstarch be used. Housekeepers all over the country who obtain the best results with cornstarch recipes always depend upon Kingsford's. This brand is carried by all modern grocers, and costs no more than ordinary kinds. Order a package of Kingsford's today, and ask for their book of recipes.

EASTER EGGS

Mothers with little children always have Easter eggs to color. An easy and satisfactory method is to use the aniline dyes that come especially prepared for this purpose. If directions are followed there will be good results. The name and date, which will greatly delight the child, may be written on the egg with a pointed stick dipped in melted lard, before placing in the dyestuff. When removed, all will be colored except the writing.

For young people who enjoy coloring the eggs for the Easter frolic there are many little home ideas to vary their brilliancy. The egg dyes give the rich plain colors, and the fancy papers to wrap around them, which may be purchased at the stores, are the usual mediums, but do not give a very large variety.

Bits of ribbon, silk, calico and flannel, outside skins of the onion, coffee grounds and a bit of bluing will do wonders if rightly handled in coloring eggs.

Take the egg, wrap the onion skins around it with the strip of blue ribbon

HAY

Under date of March 27, Scott, Magner & Miller say:

Receipts of hay for the past week were 2166 tons. This is quite a decrease from 2982 tons of the preceding week. Trade throughout the city remains light. Fancy grades of red oat or wheat hay sell without difficulty, but all other grades remain dormant. Alfalfa has been arriving in greater quantities. There is a fair demand for this commodity.

Fancy Wheat Hay (light bales) .... 11.00@12.00

Citrus Fruit Market

LOS ANGELES, March 31, 1915.

The general tone of the orange market is much better. Prices are yet but little advanced, but the fruit is arriving in better condition; there are less discounts and all stock is being cleaned up. Probably at least 15 cents more is being averaged this week than last. Everything is going forward iced now. It is probable that Orange Day and the general advertising campaign in connection with it has been a material factor in the strengthening of the market.

There is little change in the lemon market though, like oranges, the tone is generally stronger.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 13,700 cars, lemons 1727, total 15,427. To same date last season, oranges 15,352, lemons 863, total 16,215. From Tulare County to date: oranges 5,162, lemons 179, total 5,341. Last season, oranges 4,618; lemons 30, total 4,648. From Northern California: oranges 627, lemons 1. To same date last season, oranges 398, lemons 5.

NEW YORK, March 29.—Thirty-eight cars navels, one budded, four navels and bloods, three navels and tangerines, two navels, bloods and tangerines, one navels and lemons, and three cars lemons sold. Market strong, little higher on fancy, choice, poor stock unchanged. Lemons firm. Weather fair.

CHICAGO, March 29.—Health Department officials have notified dealers that green and moldy strawberries will be condemned, and Florida shippers have been warned to send only ripe berries, honestly packed, hereafter. Chief sales were at 35@40 a quart, a shade higher for fine Niekomers. Oranges, boxes, California navels, 1.90@2.40; Floridas, 2.00; very few on market. Lemons, boxes, Californias, 2.00@2.25. Grapefruit, boxes, 1.75@2.25. Apples, firm, active sales, boxes, western stock, Delicious, 2.25@2.75; barrels, Northern Spys, 3.50@4.50. Kumquats, 15@17 per quart. Pineapples, crates, 2.50@3.00.

ECONOMIC IMPORTANCE OF ROADS

Successful competition of the commercial auto truck with the steam and electric railroads in the hauling of short distance freight and passenger business is given as one reason for extensive road improvement, in the report of the joint congressional committee on federal aid to good roads. Discussing this phase of the subject, Hon. Jonathan Bourne, Jr., chairman of the committee, says:

"A great system of rural transportation would be developed, with rates regulated by actual competition, open to rich and poor alike, as no expensive privately owned terminals, roadbeds, tracks, or equipment would be required. The good wagon roads would be open everywhere to the use of everybody, and the equipment, relatively inexpensive, would be within the means of many.

"This suggestion as to the use of rural roads by commercial auto trucks and buses, is not merely a product of imagination. In several instances gasoline propelled buses are now competing successfully with city or interurban electric lines, and where the haul is but a few miles transportation of freight by auto truck is found cheaper and more satisfactory than transportation by rail.

"In the case of the short haul the saving in handling and in time more than counterbalances the lower rail rate. Instead of loading the commodities on a truck, unloading at the local railroad station, where they must be loaded upon the cars, hauled to the near-by city and then unloaded and again loaded upon a truck and hauled to the consignee, the user of an auto truck who has a hard surface road available loads his products once, hauls to the door of his consignee and unloads, saving not only the handling, but the time, the inconvenience of issuance of way bills and receipts, and avoids damage to goods or deterioration while in transit.

"We believe that permanent highways will result in very considerable adoption of auto truck hauling in preference to rail transportation where the distance is within a half day's run."

ALFALFA SEED

California is getting a reputation for growing good alfalfa seed, and we doubt not in the near future it will become a vastly greater industry than at present. There is one concern, that of the V. A. Peterson Alfalfa Seed Comqany at Arbuckle, which this year has shipped something over 600,000 pounds of clean seed, this principally to farmers here on the Coast. Bear in mind this is only one shipping concern of the Sacramento Valley.

CHEAP OUTFIT FOR TREATING FENCE POSTS

A small but satisfactory tank for the open tank method of treating fence posts can be made from one of the galvanized steel barrels used for shipping oil and gasoline. These barrels are 36 inches high by 32 inches in diameter, and by removing one of the heads with a cold-chisel, or otherwise, a tank 34 inches deep remains.

This tank is heavy enough to serve the purpose of post-treating and may be supported upon two iron cross-bars built into the sides of a brick or stone work fireplace. Such a tank will hold about 10 or 12 posts of ordinary size at one time. One of the best preservatives is coal tar creosote. The posts should be seasoned and the creosote heated to at least the temperature of boiling water with the posts in it. By leaving the posts in the creosote while it cools down a good degree of penetration should be secured with most of the quick-growing soft woods, like cottonwood, poplar, elm, and the split cedar posts found on the market. The temperature of the creosote may be roughly determined by hanging a small tin can of water in the tank, and when the water boils the proper temperature has been reached.

The process of treatment may be hastened by keeping the creosote in the tank hot and removing the posts after an hour's immersion into an open barrel of cold creosote for another hour while a new batch of posts is being heated in the tank.—B. O. L., Colorado Agricultural College, Fort Collins.

EASTER EGGS

(Continued from Page 413)

and sew it up in a thin piece of muslin. Do another with red ribbon and another with green. Throw coffee grounds in the water and boil fifteen minutes. When done wipe with a buttered cloth. Others should be boiled in the bluing water. You will quickly see the combinations made.

Another scheme, if there is much cooking going on for the festival season, is to take a dozen eggs, make a needle hole at either end and blow them. When the shells are all empty they may, with deft fingers, be dressed as brownies, nuns, and almost any character. Their faces should be painted and feet be given them on which to to stand. They can then be used as most attractive dinner cards.

By way of variety paint some of the edges with gold and silver paint, dip others in a solution of gum arabic and then in diamond dust, wrap some in colored calico that is warranted to fade and boil for half an hour.

Baskets may be arranged in nest form by using tissue paper cut in fine strips. All sorts of dainty receptacles may be concocted from boxes, crepe paper and a bottle of paste. Children love these preparations, so let the little ones have a share in planning for this beautiful festival season.

Texas expects to market 5000 carloads of onions this season.

The Name Behind the Goods

Judge Your Car Year-After-Next

Time is the big test that your car must meet. No matter how well it performs the first year—it is next year and the year after that tell the story of service or disappointment.

The time really to judge the CASE "25" is at the end of the third or fourth year. Then you will fully understand why we are so particular to build mechanical perfection into every CASE car.

Our catalog tells in detail of the many parts of this car where we spend just to keep your cars out of the repair shops and to give you complete confidence and satisfaction in your investment.

Least in Price—Greatest in Value

Of the popular-priced cars the CASE "25" costs you least, we maintain, because we include extra accessories to the value of $110.25. Our price is $1350—less 5 per cent if cash—and the CASE comes equipped with Extra Tire and Tube on Rim with Tire Cover, Weed Non-Skid Tire Chains and 8-Day Clock.

These items are necessary—particularly for country driving. Other cars do not include them. Deduct their value—$110.25—from the CASE price, and then compare it with other cars.

CASE cars offer an extra value because we can afford to put more money into their materials and workmanship. We save on selling expense where others must spend, for CASE cars are sold by the same world-wide organization that handles the entire CASE line of farm power machinery. And this saving goes into the cars in added value.

Send for Catalog and learn about the CASE—"The Car With the Famous Engine."

Case "25" Complete $1350—5% Discount If Cash

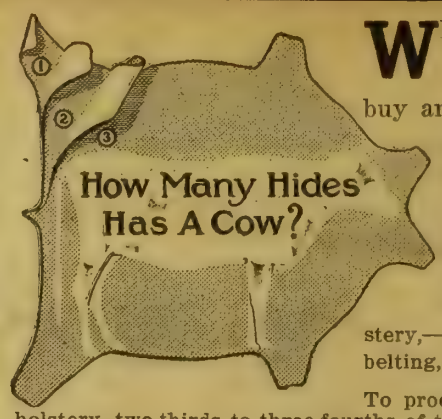
San Francisco — 15th and Kansas St.



WHO "should worry?"

You, if you expect to buy an automobile, or if the one you own is upholstered in coated "split leather" that is rotting and splitting, and giving your car a generally disreputable appearance.

A real cow only grows one hide,—too thick for upholstery,—suitable only for shoe soles, belting, etc.

To produce genuine grain leather upholstery, two-thirds to three-fourths of this thickness is split away,
To save the by-product, some manufacturers split it into two or more thin sheets, coat and emboss it to make it look like grain leather.
Hence two-thirds to three-fourths of all leather upholstery is coated splits.

Threshing California Limas

Great Strength with Light Weight;
High Speed Motor with Great Power;
Low Center of Gravity with Usual Road Clearance;
Flying Wedge Lines With Least Wind Resistance;
Luxury with Economy.

5 Leading Oakland Superiorities

Oakland

A City Car for the Farm

THE discriminating car owner in the country demands, and is entitled to, the same grace and beauty—the same speed and power—the same luxury in equipment and finish—that the car owner in the city demands.

Beyond these the car owner in the country must have *safety* and *strength* in extra measure because of the unusual demands made upon his car by reason of a variety of road conditions.

Possessing these valued features of safety, steadiness, dependability, strength—along with graceful lines and speed and power—the Oakland is the ideal car for the farm.

SAFETY is certain because of the Oakland's low center of gravity—with usual road clearance.

STRENGTH is happily combined with light weight.

COMFORT is assured on the worst of roads by the splendid Oakland spring suspension—it cradles the shocks.

Speed and Power are gained by means of a high speed motor of unusual quality and balance—and body lines of the Flying Wedge type which permit the car to cleave the air.

All these points mean supreme service, luxury and every-day economy. Let an Oakland dealer *prove* it to you. Write for catalog.

Oakland Motor Company
Pontiac, Michigan

Fours and Sixes—Speedsters, Roadsters and Touring Cars—$1100 to $1685 f.o.b. factory. Oakland specifications are a good standard to measure all cars by. Write for catalog with full descriptions and illustrations that show the cars as they are.

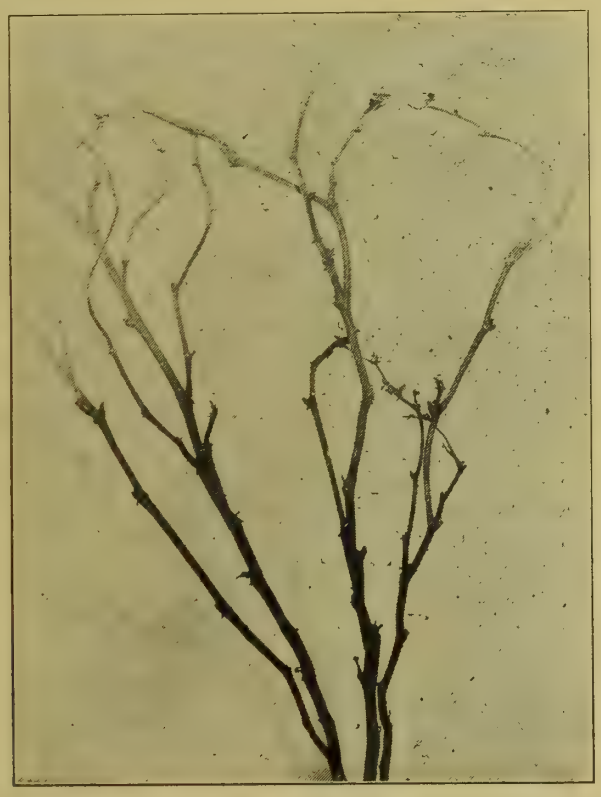
Planting and Growing of Beans

The Production of Beans Has Greatly Increased in This State During the Past Few Years. Southern Coast Counties Produce More Limas Than All the Rest of the Country. Limas are More Than Half of California's Bean Production. Practical Hints on Growing Field and Garden Beans

WITH all of California being the "greatest ever," she often neglects reference to one of her products which is making her famous. This product is the humble Lima bean. No section of the world produces this bean in such quantity and of such quality as does California. In the year 1914 this state produced 1,550,000 sacks of Limas. All the rest of the United States combined does not equal this production and two-thirds of it is by one of California's smaller counties. Ventura's production last year considerably exceeded 1,000,000 sacks. Another one of California's smaller counties, Orange, produced nearly 200,000 sacks. Only three other counties are a factor in Lima production; these are Santa Barbara, Los Angeles and San Diego, each producing in the neighborhood of 75,000 to 80,000 sacks. The island of Madagascar sends to this country a few beans, but the only serious competitor is Manchuria. There have been large importations from Asia and this may in time constitute a "yellow peril." Meantime each year sees our bean acreage increasing.



During Very Hot Weather Common Beans Drop Their Flowers Without Setting Seed.

Other beans which are largely produced in California are, Large Whites, Small Whites, Pinks, Bayous and Black-eyes. The weight of a sack of beans is variable; a sack of Limas is 80 pounds, while the smaller beans may run as high as 92 pounds per sack.

The planting of beans in this state during the coming season will doubtless greatly exceed that of any former season. This paper has never had so many inquiries as to production in different sections as this year. The state has been planting from 140,000 to 150,000 acres each year. To give an idea as to where each variety is produced, in addition to the Limas grown in the southern coast counties: Large Whites are produced in the Sacramento and San Joaquin Valleys, with a very few in the central coast counties; Small Whites almost entirely in the central coast sections, though southern coast counties produce about 11,000 sacks. Pinks are produced in the Sacramento and San Joaquin valleys, close to 200,000 sacks in each section, and central coast sections produce about 38,000 sacks. Bayous are entirely produced in the great central valley. The greatest producer of Black-eyes is the San Joaquin Valley, 80,000 sacks; the Sacramento produces about half as much and the southern coast counties about 50,000 sacks.

A new bean which we believe will yet add to California's fame and wealth has been brought to public notice of the Southwest by the Arizona experiment station. This is a bean which has been grown for centuries by the Indians and one which will stand the hottest of desert conditions. We refer to it as a bean, although we note that Bulletin No. 68 of the University of Arizona college of agriculture experiment station has the title, "Southwestern Beans and Teparies," but Bailey's Cyclopedia puts it in the same class with beans and gives its botanical name as Phaseolus acutifolius.

This bean is hardly as handsome as the Small White, usually termed the Navy. Its color is more likely to be greenish or sometimes a greenish brown, but with the careful breeding and care which will be given to it by experiment stations and others interested in it we believe that as fine an appearing bean will be produced as the Small White. It has a flavor which is very attractive, and while correspondence with many of the larger commercial concerns of the coast develops the fact that it is unknown in the market, we believe a market will be created for it as soon as it is produced in quantity.

Geo. F. Freeman, in Bailey's Cyclopedia of Horticulture, writes as follows on "Yields and Culture."

Yields and Culture

"The superiority of the Tepary over other beans for planting in the Southwest is exhibited in its greater productivity when grown under similar conditions. This statement is not only true in irrigated sections, but even more marked in regions devoted to dry farming. In nine experiments in Arizona covering almost every condition of soil, culture and water supply, and extending over three years, the average yield of the Teparies has been slightly more than four times the average for varieties of the Kidney bean. These greater yields are due to the ability of the Tepary to germinate quickly in the presence of a low moisture content of the soil, with the resulting better stands on dry lands. The Tepary is also able to withstand protracted seasons of drouth without permanent injury, returning to full vigor immediately when the rains come. Other beans do not possess this ability to a marked degree. The Tepary is also inured to the greatest extremes of summer temperatures and will bloom and set seed any month from May to November. On the other hand, when the blooming period of common beans happens to fall within a season of extreme heat, the buds will for the most part drop without setting pods. For these regions the Tepary is a more sure and dependable crop, often giving fair returns when beans are a total failure. With an ample supply of water, good soil and other conditions favorable, Teparies should yield 700 to 1200 pounds per acre. However, 1500 pounds per acre have been reported from the Colorado Valley near Yuma. Under dry farm conditions, yields of 450 to 700 pounds have been reported. On irrigated lands Teparies may be planted in southern Arizona any time from the early spring when danger of frost is past until August 10. The best crops, however, are secured by early planting, March 20 to April 1, or by midsummer planting, July 12 to 25. In dry farming they are planted any time from the 10th to the 15th or 20th of July."

Regarding bean culture, the soil preferred is a rich sandy loam. We are aware that it has been the custom to refer to extremely poor soils as too poor even to grow white beans, so that the bean has a reputation of standing for poor soil and more or less neglect, but it well repays good care and planting on good soil. As

Citrus and Tropical Fruits

A NEW ORANGE EXTRACTOR

Written for the California Cultivator
By J. Eliot Coit

AT this time of large production and modest prices everyone interested in the citrus industry is thinking of by-products and new ways to conserve the fruit. While the manufacture of unfermented orange juice has been tried and considerable experimenting is still being done, the product is not yet considered entirely satisfactory. Meanwhile it is well to call attention to the fact that oranges, when carefully handled, are much less perishable than grapes or pineapples, the two fruits from which bottled juices are most largely made. Oranges will keep for a month at least, and if properly stored, for four or five months. Freshly extracted juice is far better than any processed or bottled juice.

Lemon juice diluted with water has always been used fresh and has given satisfaction. Why is it then that the use of orange juice as a drink is so rare? One reason may be found in the fact that while every housewife has a wooden lemon squeezer or a glass reamer, these will not work satisfactorily with any but the smallest sizes of oranges. Medium-sized or large oranges have to be squeezed by hand, which is awkward, unsanitary, and "messy" at best. One's appetite is not stimulated by observing the extraction of orange juice by the old method.

Recently, however, a new utensil has appeared in the bazaars and ten-cent stores, which solves the problem and, unless I am mistaken, is destined to play an important part in the increase in consumption of oranges. It is known as the glass orange reamer and is shown in the illustration together with the glass lemon reamer which has been available for several years. With this reamer all the juice may be extracted from a large orange quickly and easily without wetting the hands.

Everyone interested in the citrus industry should secure one of these utensils and acquaint himself with the delights of fresh orange juice. The Fruit Growers' Exchange might include this in their list of premiums to advantage. No matter how thrip-scarred or spotted the oranges may be, the juice is good. Right now when there are so many eastern visitors in Southern California is a good time to do missionary work for the sake of a wider use of fresh orange juice as a healthful and delightful daily drink. Try a glass before breakfast in the morning.

THE NEW LARGE ORANGE REAMER AND THE SMALLER LEMON REAMER

THE GOVERNMENT AND THE ORANGE INDUSTRY

Written for the California Cultivator
By Martha L. Baker

For the past few years those engaged in the orange industry in California have found it anything but a profitable business, but now (thanks to Uncle Sam) the tide seems to have turned, the outlook is hopeful, and it appears that the reputation once borne by California oranges will be fully restored. Even the real estate agents report increased activity in the sale of orange lands and the exchange of groves. And this is how it all came about.

California has three separate and distinct citrus belts, that in the northern part of the state centering around Oroville, that in the southern part of the state with Redlands and Riverside as the principal shipping points, and that in the central part of the state which comprises a large area in eastern Tulare County and which has been extended southward during the last few years into Kern County. It is of the last mentioned belt that I shall speak more directly, as it was here, upon the request of the Citrus Protective Association of Tulare County, that the government was led to take definite action in behalf of the orange growers, which resulted in the establishment of a bureau for investigations and experiments conducted under the department of agriculture.

With a poor crop for the year 1911-12, followed by the freeze of 1912-13, and this in turn followed by a large crop for 1913-14, but bringing prices hardly sufficient to cover the actual cost of production, the growers were in despair. Upon the suggestion of a few, who had long held the idea that the fruit was being shipped too green, (just another case of "the early bird getting the worm," the "worm" in this case being the highest price), investigations were made all along the line. The manager of the California Fruit Exchange was sent on an extended trip of investigation throughout the East during the early part of 1914.

The results of all investigations focused themselves into two words, "immature fruit." For while the first oranges on the market would bring a fancy price, simply because they were the first, the taste did not encourage further orders; and so the sour and immature fruit, although artificially colored by sweating, became a drug on the market and sold only at the lowest figures. But how to ascertain the maturity of the fruit was a question more easily stated than answered, and

NOTT & CO. 112 So Los Angeles St. Los Angeles

here is where the United States government stepped in to lend a helping hand.

Having an office already established in Los Angeles for experimental work in citrus by-products, a branch office and laboratory was opened in Porterville, Tulare County, for the purpose of further investigations and tests in an effort to establish some basis or standard whereby to judge the maturity of the fruit. E. M. Chace, a man well informed on all phases of this work, having had a great deal of actual experience both in this country and Sicily, was chosen to head this bureau. With several chemists and helpers to assist him, constant work was done in the Porterville laboratory from early in the fall of 1914 until the end of the season, about February 1. And while as yet the experiments are not considered complete, for according to Mr. Chace it will require at least one more season's work to ascertain a final method for judging the fruit, yet a very great deal has been done to build up and assist the orange industry in the state and in this district particularly.

The "Eight to One Test" (one part acid to eight parts of soluble solids) as a temporary standard whereby to test the fruit, was suggested by the government chemists, and the same was rigorously and conscientiously conducted by the officers of the Citrus Protective Association, assisted by the managers of the various packing houses. Of course there were a few obstreperous growers who at first objected to the government interfering with their business, but who now concede it to be the very best thing that could have happened.

And so every car of fruit that left the local yards has borne a certificate of inspection. And by the way Porterville claims to have shipped the biggest single trainload of oranges sent East this season. This train, consisting of 53 cars, was approximately half a mile long. There were on it 21,200 boxes of golden fruit, valued at $45,000.

The federal aid rendered the orange growers has been of inestimable value and will mark a turning point in their business. Preventing the shipment of immature fruit and sending to the eastern markets the naturally ripened fruit, sweet and luscious, has created a demand for California oranges. The prices have been fairly good considering the stringent financial condition prevalent throughout our country during the past year. In fact had it not been for the good quality of the California fruit the prices undoubtedly would have fallen quite low, as oranges are looked upon as a luxury, not a necessity.

And now that the government has helped to solve the question of mature fruit for the growers, they are hoping for further aid pertaining to the important matter of transportation, whereby the fruit may be sent more directly from producer to consumer.

Further proof of the impetus given the citrus industry in California through the government investigations and experiments is the recent announcement of the organization in Los Angeles of a cooperative company subsidiary to the California Fruit Growers' Exchange, to be known as the Exchange By-Products Company. The object of this company will be to keep off the market the inferior lemons and to use the unmarketable part of the crop by diverting it into by-products such as citrate of lime and oil of lemon. Practically all of these two products are now being imported into our country from Sicily. The development of orange by-products will be undertaken later.

Deciduous Fruits

HOW TO FIGHT VINE-HOPPER

NO other insect pest does so much damage to the vineyards of California as the grape-vine-hopper. To aid the vineyardists to fight this tiny pest the University of California has just published a bulletin by H. J. Quayle, associate professor of entomology, of the staff of the citrus experiment station at Riverside, in which he tells how to make and apply a spray, consisting of a pint of 40 per cent black-leaf and a third of a gallon of liquid soap (or else two pounds of hard soap) to 200 gallons of water. This has been found very effective in killing the nymphs or young. Material sufficient to spray one acre of vineyards costs about three dollars.

The first signs of injury from this pest are a mottling of the leaves with gray and green. Then the leaf turns silvery, then yellow and brown, then it drops from the vine. This loss of leaves prevents the grapes from maturing properly and prevents the canes from ripening normally for the next year's wood, which means that the vine may be more or less stunted in growth. It is only when the hoppers grow extremely numerous, however, that enough injury is done to warrant treatment. It is the warmer interior valleys in which the grape-vine-hopper thrives most, and it seldom becomes injurious in the coast valleys nor in Southern California, except in the reclaimed desert region.

It is somewhat helpful to turn sheep into the vineyard in the fall to eat the leaves, thus reducing the number of insects the next year. Early plowing is also of some slight aid if practiced generally in a district.

The adult grape-vine-hoppers are almost impossible to kill by spraying, but the young quickly succumb.

This is Circular No. 126 and can be obtained free by writing to the College of Agriculture at the University, Berkeley.

From this bulletin we quote:

Control of the Overwintering Adults

"Turning sheep into the vineyard in the fall to eat the leaves results in causing the hoppers to go to their winter food plants a little earlier and also deprives them of shelter in the accumulation of leaves in the vineyard. A clean vineyard in the winter season has fewer hoppers than one in which there are more or less green growth and bunches of dry grape leaves.

"Plowing in the early spring and turning under the green growth and dry leaves does not destroy the hoppers, but does drive them to the borders or to neighboring fields. The result then of both sheeping and early plowing is to drive the hoppers elsewhere for food and shelter, but there is no assurance that many of these will not return to the vineyard when the vines come into leaf. A few may be destroyed or starved, and the efficiency of such a practice as plowing and sheeping will depend largely upon how generally it is carried out in a district.

"To kill the overwintering hoppers either during the winter or in the spring when they first come onto the vines, and thus destroy them before they multiply and do damage, would be the best solution of hopper control. Thus far, however, no generally satisfactory method for such control has been found. A three-sided screen box operated to capture the adults on the vines when the shoots are six to ei inches long has been used with succ in many cases, but it is not satisf tory for all styles of vine pruning a involves too much hard labor to s many California vineyardists. Exp ments carried on last spring in spr ing into a canvas canopy attached the spray-rig failed to kill a suffici percentage of the adult hoppers. this apparatus the vine and the wh interior of the canopy was thoroug charged with the spray, but the win hoppers proved to be too resistant any of the materials that could be u with safety to the vine. In view these objections to the control of adult hoppers, spraying for the yo or nymphs was carried on later in season.

Spraying for the Nymphs or Young

"As will be noted above the ad hoppers are almost impossible to with a spray; on the other hand young are very readily killed by proper spray. The chief difficulty i get the spray on the under side of the leaves where the hoppers are, there is the further objection t many of the eggs which are within tissues of the leaf, as well as adults, which are also present, are affected by the spray. In spite these drawbacks, however, spray for the nymphs will pay when the h pers are excessively abundant. destruction of the young greatly duces the number already present well as the succeeding generation.

Materials

"A number of different sprays w tested, but only the one found m satisfactory will be discussed h The spray found most efficient in ing the young, as well as most neu to the grape foliage and berry, blackleaf 40 per cent and soap in following amounts: Blackleaf 40 cent, 1 pint; liquid soap, one-third lon, or hard soap, 2 pounds; water, gallons. If liquid soap can be cured it obviates the necessity of b ing. The hard soap, preferably wi oil, is cut in thin slices and disso in hot water. Where soap is adde the blackleaf the spray carries spreads better, but too much should not be used or a spotting of berries will occur."

TOBACCO SPRAY

Aphis of various kinds seem to showing more persistency than e A few million of them killed off at end of the year means many o millions not destroying our c later. There is probably nothing ter than a good tobacco extract perhaps, more correctly "Black 40." This is a concentrated solu of nicotine sulphate and accompli good work where applied in t We believe it is usually used in proportion of about one part to of water but bear in mind the a are only killed by contact and brood which hatches over night neeed another dose, perhaps not tomorrow but at least by another w If this persistent work is carrie early in the season it will save m work in the future.

The agricultural experiment sta of the University of Illinois has is Bulletin 174, devoted entirely to m aphis. In treating a plot contai one-eleventh of an acre 18 gallon solution were required. This w be practically at the rate of 200 lons per acre.

By the way it is possible that Illinois station will send copies o bulletin to Californians who are terested if they will send postag cover. The station is locate Urbana.

PAINTS $1.50 GAL.

—You can buy paints cheaper from us than any other dealer in the West. We buy in large quantities and sell for the lowest prices. —Standard House and Floor Paints, $1.50 per gal.

—Standard makes of varnishes at 25% off regular prices.

Black Graphite Roof —per gal..... 50c

Standard Roof Points—red, green, gray— per gal..... 85c

Shingle Stain, made from pure ground colors —per gal..... 50c

Everything in Paints, Wall Tints, Brushes, etc., at big savings to you.

Dutch Kalsomine 4½c per lb.

$30 WALL BOARD $19

—The finest grade of wall board to be had. Compare this price with what most dealers ask. Made of three layers of moisture proof fibre with asphaltum between, or you may choose the cream white fibre board.

—Easy to lay and costs but $19 per 1000 sq. ft.

BARBED WIRE $1.85

Galvanized American Special Light Barbed Wire, in 80-rod reels, at $1.85 per reel.

Heavy Galvanized Waukegan Barbed Wire at $2.40 per 80-rod reels. Compare these prices with your local dealers. Remember we ship direct and guarantee satisfaction or your money back.

WIRE FENCING at Half Price— Per rod..... 35c

Extra heavy Field Wire, 6-inch galvanized mesh. Perfect condition; 55 inches high, 20 rods to the roll. This is just about half price. Don't pass up this big opportunity. Send us your order, your money back if you are not satisfied.

GALVANIZED POULTRY NETTING 42½c

2-inch mesh, all heights—150 lineal feet in a roll—per hundred sq. feet— full rolls 42½c

1½-inch mesh, in full rolls — per hundred sq. ft..... 55c

1-inch mesh, in full rolls—per hundred sq. ft..... $1.00

Any of this netting may be had 12, 18, 24, 30, 36, 48, 60 or 72 inches high.

"STANDARD" ROOFING PAPER

—A Splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement, nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet $1.15

2-ply, double-sanded, per roll of 108 square feet $1.40

3-ply, double-sanded, per roll of 108 square feet $1.65

1-ply, "King" smooth, per roll of 108 square feet..... $1.25

2-ply, "King" smooth, per roll of 108 square feet..... $1.50

3-ply, "King" smooth, per roll of 108 square feet..... $1.75

Send for free sample. Remember we ship direct to you.

OREGON PINE $8 TO $15

Good new rough Oregon Pine lumber, all sizes, at $8 to $15 per thousand.

Oregon Pine lath, 4 ft., new, $2 per thousand.

Best grade Slashed Grain Oregon Pine, sanded finish, $37.50 per thousand. This make a beautiful interior finish.

These prices will give you an idea of how our lumber department can save you money. Send in your lists and let us give you our price delivered.

SASH AND DOORS

—1-light sash, 40c and up.

Casement windows in pairs with 2 lights, $1.25 up.

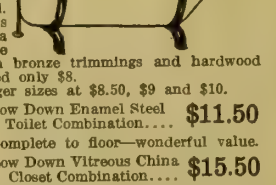
Screen doors, $1.25 and up; strongly made of best sugar pine.

A lot of 7-ft. Colonial doors, made of best sugar pine, at $1.50 and higher.

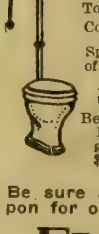
Prices on other material in this line are similarly low.

THIS SPECIAL STEEL ENAMELED BATH TUB $8

One of the greatest bargains we ever offered! Made of best galvanized 24 gauge steel. Outside is finished in a rich sky blue enamel with bronze trimmings and hardwood edge. Priced only $8.



Other larger sizes at $8.50, $9 and $10.



Low Down Enamel Steel Toilet Combination.... $11.50

Complete to floor—wonderful value.

Low Down Vitreous China Closet Combination.... $15.50

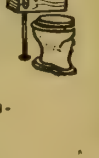
Special value—worth $22.50.

Big value in High Tank Toilet Combinations .. $10.00

Complete to floor—a bargain.

Special Bankrupt Stock of Kitchen Sinks.

All sizes— up from..... $1.00



Best Quality Porcelain Lavatories; every one guaranteed— $10 down to. $3.75

THE COMING APRICOT CROP

It has been the custom of the Cultivator to secure from all sections of the state so far as possible reports of the year's apricot crop as early in the season as possible. Of course it is too early to form very definite conclusions but we will be glad to hear from every section of the state. Let every subscriber of the Cultivator who raises apricots write us giving an estimate. This will prove of value and aid growers materially in determining prices for crops.

Following his former custom one subscriber has already sent us his estimate for his section. This is from W. G. Marchus, San Pasqual, San Diego County.

We have almost a complete failure in apricots this year, less than we have had for eight years.

Trees blossomed well but nearly all dropped. I hope every apricot section will report through the Cultivator that we may know what the crop outlook is.

CANADA THISTLE ERADICATED

Many farmers in their efforts to kill the noxious Canada thistle abandon their efforts with success in sight and the thistles soon recover, says H. R. Cox in Farmers' Bulletin No. 545 which the department of agriculture has recently sent out.

The man is of far more importance than the method in eradicating this weed, which is a pest from Maine to Kansas and in the Pacific Coast states. While the South is not liable to be affected, there seems to be danger of its spreading into the Rocky Mountain states. So serious and so general have its inroads proved that in 25 states the thistle is proscribed as a noxious weed and the law directs its killing or destruction in such a manner as to prevent the maturing and dissemination of seed.

Canada thistles can be eradicated in a comparatively short time with little or no loss in the use of the land provided the following rules are observed:

Deprive the thistles of their tops continually, thus exhausting the roots. The top of the plant serves much the same purpose as the lungs of an animal, so that if the plant is continually deprived of that it must soon die. There is no one best method of keeping down the tops. Each field must be handled according to circumstances. Usually some form of clean cultivation is the best either with a crop or by bare fallow.

Outline a systematic plan of attack. Keep the plan in mind at all times and follow it faithfully.

Alfalfa, clover, the grasses, millet, sorghum, hemp, buckwheat and small grains are all crops adapted to the purpose of smothering the Canada thistle. They restrict the top growth of the thistles by shading them and also crowd the roots. Alfalfa is probably the best for this purpose. The land should be occupied by such crops at all times so that the thistle may have no chance to recover. This method is of most value in giving the weed a setback which renders easier the work of clean cultivation which should follow.

The method of salting the thistles in pastures is adapted to small patches accessible to live stock, especially sheep. In their efforts to get the salt the stock nibble the thistles and trample them to death. It seems best to let them grow until they start to bloom and then cut off the tops close to the ground and apply a small handful of salt to each shoot that springs up. Permanent eradication of this weed by plant poisons has not proved very practicable.

Thistles that occur on waste lands may be prevented from maturing if their tops are cut off just as the blossoming starts. Two cuttings a year are usually necessary to prevent seeding. Thistles in such locations, however, can be entirely eradicated if the work is thorough. Various types of cultivators equipped with knives or sweeps that are effective in cutting off the tops of Canada thistles are shown in the new bulletin by the department's agriculturist.

ECONOMICAL MACHINERY

Has it impressed itself on your mind as a practical man selling farm crops in the form of milk through the medium of cows' manufacturing apparatus, that possibly some of this animated machinery needs overhauling and closely examining? A new machine, running more economically, may save a manufacturer its cost several times over in a very short while. So if your cows were regarded in this light, some might be found to be very economical producers, and possibly the less said about the capacity of others the better.

Some cow-testing figures given to the dairy division, Ottawa, by dairy farmers prove that some breeds of cows produce milk at a feed cost of $1.45 per 100 pounds, while close by are other herds whose average feed cost of production is only 80 cents per 100 pounds of milk. Again, between two cows in the same herd the cost of feed per pound of butterfat is frequently found to vary as much as from 23 to 49 cents.

What is of importance to the average dairyman is this fact, that cow testing helps to put each cow in the herd on a good paying basis very quickly. A simple plan of weighing and testing each individual cow's milk soon discovers if any unit machines in the milk-making factory are not in good economical running order. Then plans are laid for keeping the type of cow that makes $20 or $30 or more clear profit above the cost of feed. Does each one of your cows do that? It will pay you to find out.—C. F. W., Dommion Department of Agriculture.

LIGHTING APPARATUS

When your electric lamp burns with a red color, and not white, as it did when it was put in, it is played out. A lamp burning thus should be replaced to save money. It is consuming more current than it should for the light it is giving and so is costly.

Unless one of the latest tungsten or tantalum types, no lamp is good for more than about 600 hours on the average. The latest and best will last much longer. It is a peculiar fact, however, that inexperienced people think the electric lamp is like the old kerosene lamp—good for a lifetime, barring accidents. They do not stop to think that with the kerosene lamp the wick finally burned away and had to be replaced. The filament of the electric lamp performs the same function as the wick. Consequently it, too, burns out; but after a much longer use.

Gas Appliances for Home

Many useful gas appliances for the household have come about through competition with electricity. It has long been possible to press a button and turn on and light jets in a chandelier; but now a water heater can be installed which operates when the hot water faucet is turned on and ceases when it is shut off. The flow of hot water is instantaneous.

For the chafing dish or coffee pot an attractive Bunsen burner is attached to tubing which supplies gas from a near-by pipe. Pull sockets, turn on and light a jet just as electricity is turned on. There is also a style of student lamp gas fixture in which the flow of light is regulated by turning the knob in the bottom of the fixture.—Cleveland Plain Dealer.

Last year 48 counties in Kansas did not send a single criminal to the penitentiary, 87 did not send a patient to the insane asylum, 53 were without prisoners in their county jails, in a dozen counties no jury was called to try a criminal case. Kansas has more students in colleges and universities in proportion to population than any other state. Kansas has the lowest death rate in the world and the lowest percentage of illiteracy in the United States.

Choice Ornamental Evergreen Trees and Shrubs

Fine specimen plants can be supplied either balled or established in tubs and boxes, also in our new cement tubs. Ask us for our new list of these fine plants for immediate effects.

OLIVES

Our new "Bulletin on the Olive" gives valuable information about this industry. It is free for the asking. Bear in mind that we have a fine assortment of these trees still to offer. Our prices are right.

CITRUS TREES

If you have not already arranged for your citrus trees this season we can offer you the finest stock on the Pacific Coast. Our assortment is complete in varieties and sizes.

Write for our special quotations.

TRACTOR FEATURES Win *CASE* Supremacy

Since the very invention of the traction engine, the name of *CASE* has stood for unchallenged supremacy. In power plowing, as in every other field, *CASE* Steam, Gas and Oil Tractors have won through actual performance.

Cost per acre plowed is one common method of comparing tractors. Countless working tests and public contests have proven *CASE* superiority here.

Working speed is the second big consideration in a tractor for plowing. *CASE* holds records for the greatest average number of acres plowed per hour.

Lasting quality is the third and greatest consideration in choosing a tractor. *CASE* would win on its lasting quality alone, even if it did not lead in the other two big points. Durability is the one greatest *CASE* consideration.

CASE 40 H. P. Gas and Oil Tractor

20 Years In the Making

CASE does its own experimenting—and at its own expense.

This world's champion oil and gas tractor has never been defeated, because it was mechanically correct before the first machine was sold.

This type of tractor represents years of experiment by the leading motive power engineers of the country.

A *CASE* for Every Purpose

CASE Gas and Oil Tractors are as superior in their class as *CASE* Steam Tractors always have been in the steam class. Made in 60 and 40 H. P. for Oil or Gas, 25 H. P. Gas, and from 30 to 110 H. P. for Steam.

CASE Tractors and *CASE-RACINE* Tractor Gang Plows contain exclusive features that you must have.

Free Information

Interesting illustrated catalog describing *CASE* power-plowing equipment will be sent upon request. A postcard will bring it.

Some tomato growers are making excellent profits by training tomatoes to single stems. The plan is especially desirable when only a small area of land is available for cultivation.

Small Fruits Vegetables

BERRY JUICE "KEEPS"

AMONG other remarkable qualities loganberry juice has the property of retaining its freshness for several weeks without any sterilization whatever, according to recent investigations conducted by Professor C. I. Lewis, horticulturist of the Oregon agricultural college. About the first of July Professor Lewis took considerable quantities of loganberry juice, without heat, sweetened it to taste and poured it into bottles which he set away in the basement rooms of the horticultural building. The bottles were not sealed, nor was the temperature of the room cooled below normal. At the end of six weeks an examination of the juice showed that its appearance was unchanged and that fermentation was just beginning to set in. Upon tasting, the juice was found to be sweet, with no more than just a "sparkling" taste to enrich its flavor. Professor Lewis considers its self-sterilizing power very unusual and destined to make it a popular beverage wherever loganberries are grown.

WINTER RHUBARB

We have always felt that the shipping of winter rhubarb would some time become an important feature of California small farming. It has been tried for many years but for some reason the market has not taken to it as keenly as we would like. At one time there were several hundred acres planted about Pomona and other sections and carload shipments were made. We believe the stock was objected to in part because of its small size. The ordinary Crimson Winter, which is reproduced from seed, has shown too large a proportion of very small stalks. There has been a great deal of effort toward securing a larger stalk of equal quality to the ordinary Crimson Winter, and this has resulted in the Giant Winter Crimson which is being received more satisfactorily. Lee Brothers of Covina are shipping to Eastern cities an attractive "Fancy Quality and Honest Pack" brand. Regarding Lee Brothers' work the Covina Argus remarks:

"Mr. Lee says that he is well satisfied with the results from rhubarb this year and will put in ten acres of the plants for the coming year. He expects to plant out all available space on his Covina ranch. The Arcadia ranch is on Baldwin Avenue, about two miles east of the Monrovia car line.

"For several years Lee Brothers have been working up a trade in a special brand of rhubarb, which is purchased by the hotels in the big cities of the East. The soil of the Covina valley is especially well adapted to the growth of this popular pie-plant. The Lee Brothers say, however, that it took several years to perfect a method of growing and marketing that would bring a profit in the business."

PRODUCTIVE VEGETABLE GROWING

This is the title of a book just off the press by John W. Lloyd, professor of olericulture at the University of Illinois. While it was prepared primarily as a text book for students in schools and colleges, still it is eminently useful and practical for the gardener, whether he be working for home use or on a large scale for commercial purposes. The author has discussed thoroughly the principles underlying the successful practice of gardening in all its phases. His descriptions of methods are so full and so clear that any intelligent person may follow them. At the same time the reader is not burdened in the least with too much detail. Leading chapters are on factors influencing quality; seed, plant food and moisture supply; the use of glass; soil preparation and planting; insect and disease control; the home vegetable garden; harvesting, marketing and storing for winter use.

In the discussion of the various vegetables Professor Lloyd has made an admirable classification which is based on the all important requirement of temperature. His two main groups are cool season crops and warm season crops. Under the former are three subdivisions listing cool season crops that quickly reach maturity, cool season crops that usually are transplanted and cool season crops that will endure summer heat. Under warm season crops are two subdivisions listing those usually not transplanted and those that require transplanting. The need of such a classification for the student who is trying to learn the culture and uses of each garden crop is apparent. But it is equally useful to the farmer who has not given much thought to his vegetable garden, for with a glance at the list he knows what to plant and when, and saves much time and avoids many a failure.

The farmer receives excellent advice in the plan of his garden, which is to give the garden ample space and plant in long rows wide enough apart to cultivate with a horse. The farmer has a maximum of land and a minimum of labor for gardening. Thus he should so lay out his plantings that he can do most of the weeding and cultivating with a horse. The city man is the opposite. He has a minimum of land and a maximum of labor (for exercise and pleasure), thus he must intensify on a small plot.

The author modestly states that the book is written from the viewpoint of the "corn belt" but from my knowledge of the country I do not hesitate to say that it will be found valuable anywhere east of the Rockies. Even as a Californian I have learned much from it in a few hours' reading. Any one interested in gardening on this coast and who has the means will find the volume fully worth a place in his library. The author has had a long experience as a grower, experimenter and a teacher, and what he says about vegetables is interesting reading. The book is well illustrated, 193 illustrations in all, and has an attractive makeup throughout. It is one of a series of farm manuals edited by Dr. Kary C. Davis, and if all the series are as good as Professor Lloyd's they are sure to find a large place in our schools and colleges and in farmers' libraries. The publishers are the J. B. Lippincott Company of Philadelphia, and the price is $1.50.—Leroy Anderson.

"WINTER RHUBARB, CULTURE and MARKETING"

By

Reginald Bland

A complete manual of field culture for this valuable crop, filling an important vacancy in Agricultural Literature. Chapter titles are: **Rhubarb and Winter Rhubarb, Selection of the Location, Preparation for Planting, Planting, Culture, Picking and Packing, Marketing, Propagation and Development.**

This new book will be useful to successful growers; invaluable to beginners, to prospective planters and to those who may have been unsuccessful; Interesting and Instructive to all.

The strenuous pioneering years are over. Recent developments have brought new life and impetus to rhubarb culture. One company, shipping from 200 to 250 cars annually (over 90 per cent of the total California production), says, "We now have more customers on our books than we have rhubarb"—and only a few of the big eastern markets have been supplied. Every one who wishes to profit by this great opportunity should have the sound, practical instruction and advice to be found in

"Winter Rhubarb, Culture and Marketing"

In cloth 50c; in paper, 25c; postpaid.

THE ORNAMENTAL GARDEN

Written for the California Cultivator
By Ernest Braunton

NOW that the most active garden season is with us some will begin new gardens and others will overhaul and replan the old one. In doing this work do not forget the first and fundamental consideration — to preserve open lawn centers. A front yard cluttered up with trees and shrubs is never attractive. The simpler picture is the stronger one. The lawn should be left as large and as unobstructed as possible. Many planters, having at their disposal but a small front lawn, usually (and unfortunately) bisected by a cement walk to the front door, feel it incumbent upon them to completely fill the two limited areas by planting some large-growing palms, usually two Phoenix Canariensis. Having thus planted it is quite impossible to stand in the center of your landscape and see about you, as you should be able to do, a fine variety of plant life.

Those who have lived in the Mississippi Valley or in states farther East will doubtless recall seeing little openings or natural clearings in the woods, consisting of one or many acres. Though in the midst of the forest, the floor or greensward remains inviolate, not a tree or shrub upon it. Grass and herbaceous flowering plants form the cover or carpet; bushes and larger shrubs edge it about; next small trees; and then the forest giants frame the whole, making a perfect amphitheatre, a miniature landscape, perhaps, yet complete in every detail. Then may the joyous discoverer stand in the center and see all about him the varied wonders of the local native vegetation. Many a time and oft, in boyhood's happy days, has the writer been overjoyed with the finding of such beauty spots and has stood spellbound and awed by the overwhelming beauty of the scene. Would that puny man could build gardens of equal charm!

Allow your lawn centers to remain open and clear that the whole yard may appear as large as possible; generous, yet well and fittingly framed with plants, shrubs, and trees on all sides. If you must have a large, spreading palm on a small lot, place it at the side of the house, well toward the rear, or, better still, in the back yard where it may also serve as a shade tree. Yet even there the same rules properly should obtain that govern the planting in front. Better to use fan palms, if you must have palms, or plant the more beautiful cocos plumosa, of which we have some quite hardy varieties. Avoid, if possible, cutting your front lawn in two equal parts unless a purely formal effect is desired. Rather have the front walk well to one side and thus gain a larger single lawn. This procedure will also allow a graceful, sweeping curve in the approach to the front entrance, a pleasing variation from the usual inartistic straight-from-gate-to-door plan.

Fertilize Roses Now

In nearly 30 years' residence in Southern California I do not recall a year when the month of March produced so few roses as has the one just gone by. Even the few roses that did come were very poor flowers. As the trouble is universal we must ascribe it to climate. But the troublous period is believed to have passed and a good spring rose crop will still be enjoyed. See that your roses are well fed now and no more trouble will be experienced. On the contrary, the outlook is promising, but food is needed. Well-rotted animal manure is as good as anything that could be applied to a rose bed. If thoroughly decomposed, do not be stingy of supply for you can not hurt the roses with an excess. Fresh manure may be used, but keep it away from the stems of plants.

Flowering Acacias

The most glorious blossoming period for acacias is now past and the season's observation but confirms the good opinion I have always held of Acacia dealbata, as either street or garden tree. It is much superior to Acacia Molissima, which generally blooms a week or two later and has globular flowers of a much lighter hue. The tree is also slower of growth than is A. dealbata. Otherwise the trees appear quite similar to anyone but a plant sharp. Plant A. dealbata freely; it is hard to beat for street use, also hard to find this year. It should be heavily pruned each year for the first five years after planting on the street and do not be afraid of too much pruning.

A Shrubby Acacia

While harping on acacias, it may be as well to call attention to the value of a shrubby species, A. cultriformis. This excellent plant is one of the most ornate, whether in flower or out. Its specific name means "knife-leaved," though the designation is decidedly far-fetched. The leaves are triangular and closely resemble a large size of glaziers zinc "points" used to keep panes of glass in place before putty is applied. They are also a zinc-gray. The flowers are as beautiful as those of any acacia, though not so large as those of A. pycnantha, but of the same rich deep golden hue. To make a compact bush the plant should be "headed-in" once each year, as soon as the blossom period is passed, or just at present.

Soap Powder for Scale

Some time since I recommended a washing compound for use as a spray for all scale insects, and now inquiries are arriving wherein the correspondent wishes to know what it is and where it may be procured. As it is the most effective scale wash used in my garden (one pound to five gallons of water, the handlers of the compound should "get busy" and freely advertise the same.

Have a grape arboor at the back door. Make it of rough boards if you choose. Nature will take care of the beautifying. The grapes will more than pay for the cost of the material and the labor, and it will be a thing of beauty and a joy all summer to the hot, tired housemother. She can set up her table and bring her kitchen work out to its grateful coolness, and, with the aid of a portable canning outfit, she can even put up all her fruit and vegetables under its protecting shade.

An Overproduction of Apples ?

The present demand for apples in the United States, including those used for export, is placed by the Department of Agriculture at 55,000,000 barrels. If that many apples were raised in this country there would be no overproduction. Figures from the Department of Agriculture show there has been an average annual decrease of 25 per cent in the apple production during the last nine years. The serious shortage that exists for apples is attributed largely to the dying out of the old orchards and the insufficient plantings of new ones.

The Yucaipa Valley, eight miles from Redlands, altitude 2400 to 3000 feet, is the place to plant an apple orchard, and this is the time of year to visit Yucaipa and see what you would have if you had planted four years ago. It is not too late to make a start.

Come to Redlands and let us take you to Yucaipa and show you our five, ten and twenty acre tracts at $285 per acre, on very easy terms. One share of stock in a Mutual Water Company with each acre.

Redlands & Yucaipa Land Co.

Gasoline Engine

Will pump over 1800 gallons of water per hour against an 80-foot head.

Will grind 3 bushels of shelled corn or small grain per hour.

Will shell 20 to 30 bushels of dry corn per hour.

Strength, weight, durability, workmanship and fuel economy, all guaranteed by Fairbanks-Morse quality.

Fairbanks, Morse & Co.

Warehouses in 30 large cities, where delivery can be made and car-lot rate of freight only, added.

PLANTING AND GROWING BEANS

(Continued from Page 419)

to moisture, it will endure some lack. Many crops are grown in this state without irrigation, and many growers maintain that irrigation does not give sufficient increase to justify the additional cost, but care must be observed to preserve every drop of the natural rainfall. Bean raisers who have had years of experience begin soil preparation with the first fall rains. Deep plowing is given and each rain is followed by a light cultivation. This firms the sub-soil and puts the surface in the best condition for the seed.

The time of planting cannot be given accurately for each section because each section has its own conditions which must be studied. The southern coast counties usually plant Limas during the month of May. The first reuisite is that the soil be thoroughly warm. Some growers prefer the earlier planting, but if an April shower compacts the soil the crust which is formed after the rain prevents the young shoot from coming through and also endangers rotting of the seed. The later planting also enables weed destruction and lessens the amount of hoeing required.

As to planting, there are drills that are adapted to all sizes of seed. The distance apart of the rows is 30 to 40 inches and usually eight or 10 inches in the row, though some Lima bean growers prefer cultivating both ways.

The cultivation is more with the weed cutter type of cultivator than with the chisel tooth. Harvesting is done by the use of a knife or steel blade fastened to the bottom of a sled and run just underneath the surface. After the cutting with this tool, which is usually a home made one, the beans are forked into small piles and allowed to cure until time for threshing. Often the threshing is done with the regular grain thresher, with a portion of the teeth in the cylinder removed, though there are regular bean threshers now being constructed which are superior. Often, however, the beans are tramped out in the good old way on the threshing floor, which is a smooth spot at one side of the field. This is sometimes done with animals only, but usually with some implement similar to the ordinary disk cultivator. One objection to this form of threshing is that if a storm comes up the beans are more liable to be injured than where threshed and sacked direct from the machine.

On cover page is shown the old-time threshing machine method of handling beans.

Mr. H. L. Musser adds a few words as to bean culture.

By H. L. Musser

Southern Salifornia is eminently a bean growing section; the acreage is even on the increase. About 20 years ago Ventura County was the recognized home of the Lima and enjoyed a monopoly of the great industry, but the demand grew beyond the Ventura supply, and the land lying between Los Angeles and the ocean was tried and proved to be suitable for growing Limas. Now some 20,000 acres of land within Los Angeles County is annually planted to the common Lima, and every acre of Limas is grown without irrigation.

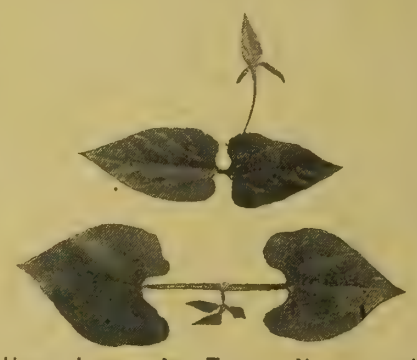
General Culture

The ground is plowed in the fall as soon as the crop has been harvested; then harrowed several times during the winter season, so that the soil will not become baked, crusted, or packed —but like a loose mulch. It thus retains its moisture throughout the summer.

In April or May the beans are planted with a bean planter, two or four rows at a time. This planter is fashioned after the corn planter, with plates made purposely for beans. There is a new planter which does the work correctly and more ecconomically, inasmuch as it drops a certain number of seeds any desired distance apart. The correct distance for Limas is eight inches apart in rows 30 inches apart, dropping 50 to 60 pounds of seed per acre.

Black Eyes, Pinks, and the Small White beans rank next to the Lima in commercial importance. The cultural instructions are about the same as for the Lima, but the beans are smaller and require a less number of pounds to the acre—say 30 pounds of Black Eye's, 40 pounds of Pink's and 30 pounds of the Small White on rich land that can be irrigated; but ten pounds less per acre should be planted where they cannot be irrigated.

If the soil has been irrigated and thoroughly pulverized just prior to planting, only one irrigation is necessary to mature a good crop. This should be done just after the bloom has fallen; then cultivate as soon as the soil will permit.



Upper Leaves Are Tepary, Narrow and Pointed With Short Stems. Below, Ordinary Long Stem Bean.

Sometimes mildew appears on the vines; this should be anticipated. The fields should be watched closely, and at the first evidence of it, the entire field should be sprayed with the best grade of powdered sulphur. This is easily accomplished by driving through the field with a wagon having an alfalfa or barley seed sower attached; with this the sulphur can be sprayed broadcast. This should be done on a calm morning. Sulphur will not cure, but will prevent mildew; therefore, the importance of applying the remedy at the first appearance of the disease. Sulphuring has rarely been necessary with the commercial crops, but it is attended to faithfully by the gardeners who wish to prolong the life of the vines.

The Tepary

A word about the Tepary bean: This is new to the commercial world, but it is of such excellent flavor that there is little doubt but the Tepary will advance in importance to rank with the Lima. It is a native of the desert, will grow on the mesa lands or indeed on any kind of soil without irrigation. If there is sufficient moisture to germinate the seed, this bean will mature a crop within 60 days from time of planting.

For commercial purposes irrigation is detrimental because the beans will then mature irregularly, with the result that you will have fully matured and half matured beans all mixed together, producing a second grade article.

It requires from 10 to 20 pounds of seed to plant an acre. The quantity should be determined by the richnes of your soil; the richer the soil, th more beans may be planted.

We advise planting so that on

How to Contro Grape Mildew

Finely divided sulphur is known t be effective for grape mildew contr when it can be kept properly sprea over the surface of the foliage an canes. Obviously then the logic treatment is to apply this sulphur a a liquid spray. Another point to b remembered is, that the more finel divided the sulphur the more uniform the covering and the more adhesiv the spray the better will be the r sults obtained. Also a liquid spra may be effectively applied to the u dersides of the leaves and on th canes where it will do the most goo ATOMIC SULPHUR dilutes readily i water, remains in good suspensio spreads well over the surface of fol age and canes, is adhesive and give the right results. The sulphur more finely divided than in any dr forms of sulphur and the greater a hesiveness gives protection over longer period of time; one applicatio being sufficient and doing more goo than two or three dry application Use 12 pounds to 100 gallons of wate and spray the vines soon after growt starts and before blooming. (Atomi sulphur is also best treatment know for mildew on fruit trees and orn mental plants.) Full information gla ly furnished free on application to W. Foster, Entomologist, Gener Chemical Company, 201 Sansom Street, San Francisco, Cal.

ne will grow every six inches in ows two feet apart. When planting is bean on the desert where hot inds are liable to come, set the rows that the winds will sweep them om the end and not at the side of ie row. In this way the end vines ill protect the rows.

The Tepary bean promises to be a reat boon to the homesteader and ie who is pioneering under the des- t act. The homesteader must pro- uce a crop; the Tepary will do it. he pioneer must have an income as on as possible; therefore, without ater for irrigation, the Tepary will ithin three months bring him an in- ome of $30 to $40 per acre, and his nd is at once a valuable asset.

The year of 1915 will prove one of nportance to the now waste lands of ie Southwest. More than 1,000 acres ill be planted to the Tepary; this, ith an average yield of 1,000 pounds er acre, will produce 500 tons, or 5 carloads, at a valuation of three ents per pound, which means $30,000 the growers with an outlay of about ne-sixth—and all possible within a w months' time. Then too, this ean comes on the market ahead of ll others and should the market be are, the price would be higher than ie above estimate.

The Tepary has a record of having ielded 3,000 pounds per acre. It hould be harvested as early after aturing as possible because of the endency of the pods to pop open in ie field thereby losing a large per- entage.

Nitrogen Bacteria

This should be applied in every in- tance where beans are to be planted n soil that has not previously grown crop of beans or some other legume. t is inexpensive and will insure a rop on poor or new lands, where ithout it failure would be certain.

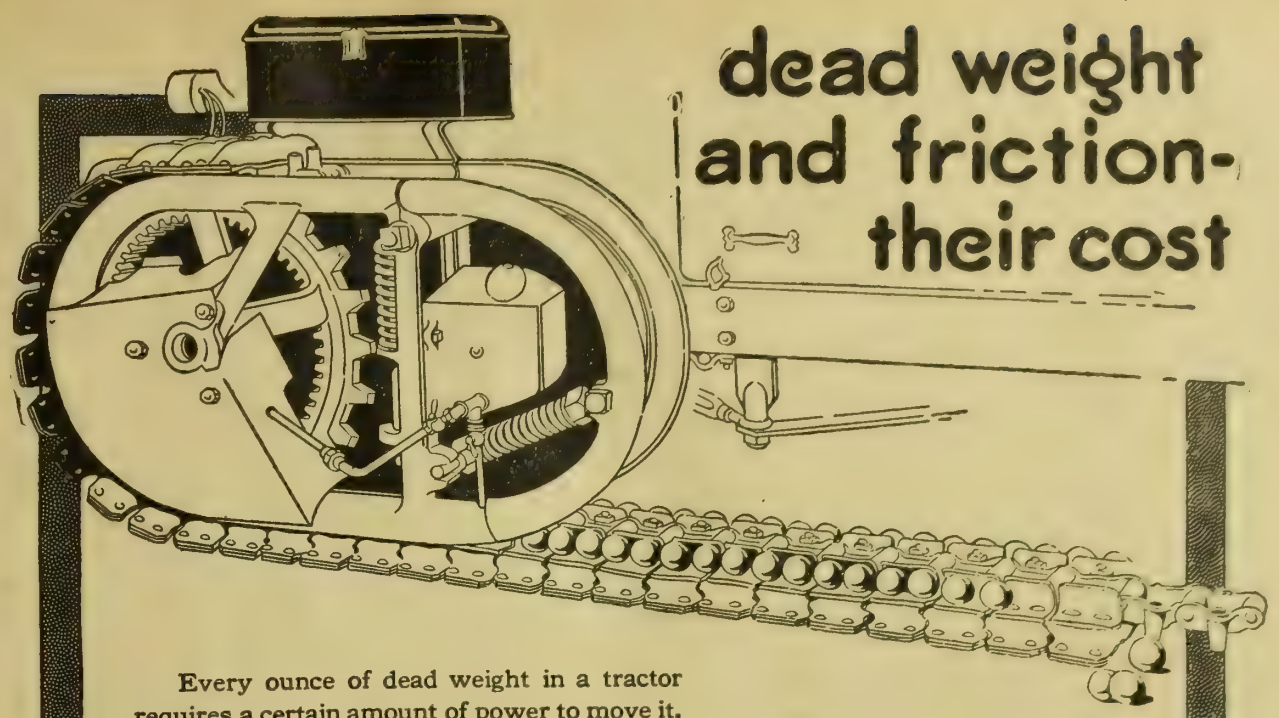
GARDEN BEANS

Written for California Cultivator
By D. F. Reichard

THERE are beans and beans and still more beans of which if you wish to know as to their origins, botanical relations, etc., we refer you to he encyclopedia or Henderson's Handbook on Horticulture or The Vegetable Garden by W. Robinson. Here we are particularly concerned bout the garden or edible podded eans, which include those used in he green condition as snap or string eans, shell beans and garden Limas. Edible pod beans were all origin- lly of a vining habit and natives of warm continent, doubtless South merica. With the development of he dwarf growing varieties which ma- ure in a shorter season, their habitat s being extended until now we have s one of our principal bean growing ections the states of Idaho, Montana nd Michigan.

In California the conditions for bean rowing are as nearly ideal as can e asked for. From the frostless or ermal districts near Los Angeles ome the first beans of the year dur- ng February. These are the product f seed planted during November and ecember previous. The varieties sed are almost without exception the anadian Wonder for green beans and ie Ventura Wonder Wax for the yel- ow or wax pod beans. The area for rowing these winter beans is limit- d, while the market is more limit- d on account of the necessarily high rice of the product. The Canadian Vonders are used for general plant-

(Continued on Page 447)



dead weight and friction- their cost

Every ounce of dead weight in a tractor requires a certain amount of power to move it.

Every bit of friction in bearings or in the meshing of gears is a drain on the motor—a power leak.

The tractor is designed to pull loads. Dead weight and friction cut down the amount of power delivered at the drawbar. The expense of developing power to overcome that dead weight and friction is a total loss—a non-productive investment.

In The Yuba Ball Tread Tractor, high-grade steel is used, instead of weaker and bulkier material, to cut down dead weight.

THE YUBA BALL TREAD TRACTOR

High-duty roller and ball-bearings are used instead of babbitt or bronze to reduce friction.

The tread is an enlarged ball-bearing.

Cut and hardened gears of very high-grade steel, having a special tooth shape which gives a perfect rolling contact instead of the usual sliding contact, are used in the transmission. Every part is kept thoroughly lubricated without requiring the operator's constant attention.

There are many other points which are enumerated and explained in our booklet, "The Yuba Ball Tread Tractor."

Irrigation Forestry

GATE STRUCTURES FOR IRRIGATION CANALS

MOST of the gate structures in American irrigation canals a few years ago were of wood, but more recently concrete, both plain and reinforced, has come into common use. Wood has the advantage of cheapness and of easy handling and the disadvantage of rapid depreciation, while concrete which has the advantage of permanence is more costly. The kind of material used, as well as other features of gate structures, varies in different irrigated regions of the West. One section often uses features especially adapted to it of which other sections, that could use them equally well, are ignorant. The United States department of agriculture is endeavoring to bring together such designs for gate structures as are adapted to many localities so that each locality may profit by the practices of others, and has just issued a new bulletin (No. 115) entitled "Gate Structures for Irrigation Canals," intended to be of assistance to engineers and others with technical knowledge of the subject.

The purpose of all the gates considered in the new bulletin is the control of the flow of water in the ditches or canal systems. Headgates and floodgates regulate the water entering the system from the source of supply; check gates regulate the water while within the canal; sand and waste gates control the water which is to be turned out and wasted; and branch canal, lateral and delivery gates regulate the water turned out to branches of the system or to users.

Small and medium-sized structures are for the most part described in the new bulletin, as it is believed that most of the problems confronting the engineer located in isolated regions of the West relate to this class. The bulletin should also be of value to directors of mutual water companies who are themselves irrigators and who are called upon to pass upon questions of construction and maintenance.

Since the bulletin is prepared for engineers and others who are familiar with gates and gate structures, it does not attempt to treat the subject fully, but merely gives examples of structures which serve the purpose for which they are intended better than many others in common use. Local conditions control many features of gate structures, and the descriptions given relate to existing structures in actual use, which it is believed will prove suggestive and can be readily adapted to other conditions by local engineers and ditch owners.

Wood or Concrete?

One of the important questions dealt with is that of the materials to be used for gate structures. Shall they be of wood or concrete? The best practice, according to the department's investigator, seems to make a structure of combined wood and concrete, using concrete for the parts that are inaccessible and not easily replaced, and wood for the accessible parts which can be replaced easily. Local conditions affecting the relative prices of these materials will also help to determine which material should be used.

Because of the high cost of water rights, and the inability of settlers to make the payments required, there is much to be said in favor of the cheaper wooden structures for original construction with a view to their replacement with more permanent structures of concrete, as the wood decays. This will lessen the first cost and will bring the heavier cost after the lands have been put under cultivation. The use of wood has the further advantage that in case of mistakes in either the type of structure or the location it is not so costly. It frequently happens that structures are found to be placed too high or too low, or they are too small and not of the best type. A few year's experience in their operation will demonstrate these facts after which a more permanent structure of wood or concrete may be put in.

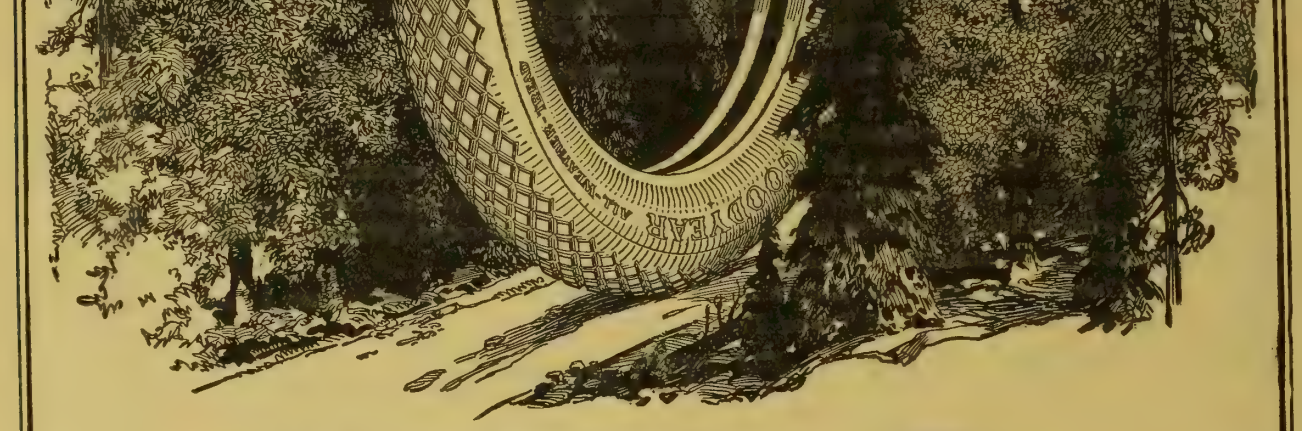
However, if the failure of a structure will result immediately in great damage to the canal system or to crops, only the most nearly permanent construction should be used at first. If the failure merely means the replacement of the structure itself the cheaper construction may profitably be put in first.

The new bulletin contains 61 pages and numerous plates and figures illustrating structures that have already proved practicable. The new bulletin is strictly a professional paper and of little interest to the farmer in general, but the attention of the engineers and directors of farmers' canal companies in the irrigated sections of the West is invited to its contents. The bulletin may be had free as long as the department's supply lasts by those who may find it profitable to use.

ALFALFA IN THE SOUTHWEST

One of the best additions to alfalfa literature is Bulletin No. 73 of the agricultural experiment station of the University of Arizona. It is written by George F. Freeman and very fully touches upon soil conditions required for best results with alfalfa.

"The greatest value of alfalfa lies quite possibly in its contribution to the soil of nitrogen and organic matter which prepares the way for most other crops and which assures us of well-nigh everlasting fertility for our agricultural soils. In this favored region, therefore, the misgivings of agricultural philosophers stand disproved; the defeats of agricultural commerce are forgotten; the costly ingenuities of humankind are discounted; and the quiet agencies of nature, properly understood and utilized, assure us that our days will be long in the land which our patience has reclaimed."



The Maximum Tire

Yet Price Reductions for Two Years Total 45%

Since the beginning there have been two policies on tires. One has been to skimp tires to make the price attractive. The other has been to secure lowest cost per mile.

Goodyear started many years ago to build the best tire possible. We went to extremes. We created a department of experts—costing $100,000 yearly—just to find ways to build tires better.

We created the Fortified Tire.

That means a tire protected against trouble in five exclusive ways.

These features were costly. For a long time, these Fortified Tires cost users one-fifth more than other standard tires.

Jumped to the Top

Yet Goodyear tires, despite the price, became the largest-selling tires in world. They have remained so ever since.

Their success is amazing. Last year we sold about one Goodyear tire for every car in use. Yet we have a hundred rivals.

Then came price reductions.

Multiplied output brought down our cost. Rubber and fabric also came down. Within two years we made price reductions totaling 45 per cent. Our last one was on February 1st.

Tires Never Skimped

Yet never in one item have we skimped these tires. Every year something has been added. And we still are spending $100,000 yearly to find ways to better them.

They still excel in these ways:

In our No-Rim-Cut feature. In our "On-Air" cure, which saves countless blowouts. That alone costs us $1500 daily.

We form in each tire hundreds of large rubber rivets to combat loose treads. In each tire base we vulcanize 126 braided piano wires to make the tires secure.

Our anti-skid tread—the All-Weather—is made double-thick and tough. That combats wear and puncture. The grips are sharp and resistless.

GOODYEAR
AKRON, OHIO

Fortified Tires

Fortified Against
- **Rim-Cuts**—by our No-Rim-Cut feature.
- **Blowouts**—by our "On-Air" cure.
- **Loose Treads**—by many rubber rivets.
- **Insecurity**—by 126 braided piano wires.
- **Punctures and Skidding**—by our double-thick All-Weather tread.

You need these protections, and you ought to get them. They mean less trouble, more mileage, less expense. Men all around you are enjoying these savings. Ask them what they mean.

This quality tire at today's quantity price is the greatest value in Tiredom. Any dealer will supply you.

General Agriculture

LIVE WELL!

Written for the California Cultivator
By A. L. Bancroft

DOES it stand in the minds of the farmers, and all who live on acreage in California, that they are entitled to the very best living that the land affords, and that the best in California is the best in the whole world? The city and the town have some attractions in the way of entertainments and social gatherings that the country does not afford, but the farmer's table can average greater attractions than can be had in congested places.

Where man can live pleasantly fruit trees will grow and thrive and the farmer's home orchard should be the best possible in every particular, in variety and quantity, under existing conditions, and his home vegetable garden and flower garden no less so. On his table at every meal during the whole year should be found the best of spoon fruits, by which is meant sliced fresh fruits, and berries in their seasons and the best of cooked, dried, glassed or canned fruits at all other times. Fresh vegetables of one kind or another are also available the whole year. And with an abundance of good fruit and vegetables any one can live well with but very little animal food.

With good preparation of the ground, fertilization from the barnyard, cultivation and irrigation, and with intelligent pruning and care, he can have the very best. Vegetables fresh from the garden are much better than those wilted ones, days old, that have been hauled over the hot dusty roads for many miles.

Small fruits would naturally be much nicer when picked fresh from the home garden than when bought from the wagon of the peddler. Then the flower garden will supply what cannot be had from the vegetable man.

Taken as a whole the product of the home orchard, vegetable garden, small fruit patch and flower garden will cost much less to grow than to buy and be infinitely better and more of them available for family use, and would therefore be used more freely. Even in some exceptional cases, should the cost be more, would the results not be better and worth more? There is a pleasure and satisfaction to be derived from the cultivation of home table and house supplies that will more than compensate for some of the outdoor work by the men, women and children of the family.

Even if the place for your garden is not garden soil, make it so. Not much land is required for a family garden. With stiff adobe, a few loads of alluvium from the banks of the creek, with the scrapings from the barnyard and stable manure spread thickly over the patch, plowed in deep and well disked, will make of it what it should be. One treatment of this kind with top dressings occasionally will last for a long time.

Eggs, poultry, spring lamb, Belgian hare, and good veal should not be overlooked; and even sucking pig on rare occasions is the farmer's due; and what is due to the farmer it is his duty to have and use. The tenant farmers of England, as a rule, live better than the owners of farms do in America.

When the children are of a suitable age some of the home-grown supply business might be turned over to them and the family buy from them, and also let them sell to others. Such a course will add to their business ideas and education and interest in home enterprises to a wonderful degree.

With good roads and a good road car the town and town attractions are not so unattainable as they once were. We are coming into our own in many ways; let us not overlook any of them.

In market terms a "broiler" is a bird weighing from one and a quarter to two pounds when dressed; a "spring chicken" is a young bird weighing between two and three pounds, dressed; a "stewing chicken" weighs three to four pounds, dressed, and a "roaster" weighs four or more pounds, dressed.

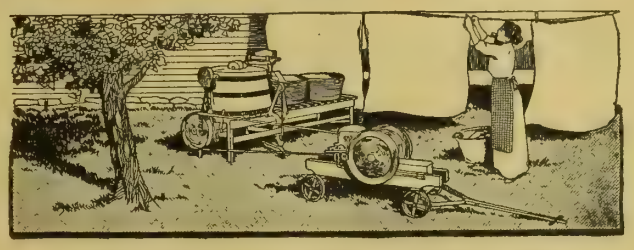
John Deere Farm Implements

John Deere Implements



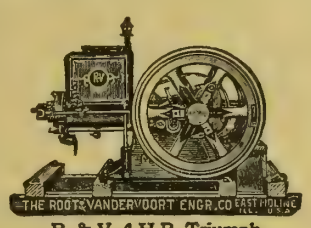
R. & V. Gasolene Engines

New Triumph One Horse Engine. Just the engine for light work about house and barn, such as running washing machine, pumping water and operating other small machines. Saves every member of the family work and worry.

A reliable, efficient, low priced but high grade engine. Easy to start, smooth running, requires no attention when in operation, economical in use of fuel and perfectly safe in and around buildings. All working parts are back of the fly wheel out of the way—a neat outfit in every respect.

R. & V. Triumph Engines for All Farm Machinery

The R. & V. Triumph line of engines is also made in 2, 4, 6, 8, 10, 12 and 16 H.P. sizes, stationary and portable. Every farm can use one or more of these engines to advantage.

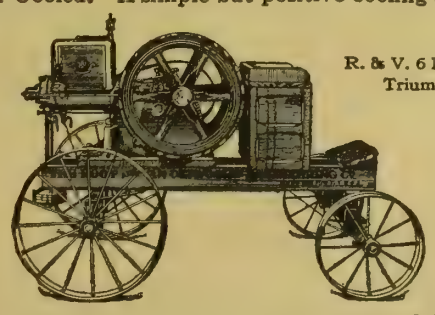


R. & V. 4 H.P. Triumph

They are dependable gasolene engines—always develop rated horse power.

An extra ring over the piston pin prevents scoring and ruining cylinder. This is an unusual precaution for lengthening the life of a gasolene engine. This careful attention to details is followed in constructing every part of the R. & V. Triumph.

Hopper Cooled. A simple but positive cooling system.



R. & V. 6 H. P. Triumph

The gasolene tank for every R. & V. Triumph Engine is most conveniently and safely located—on practically all of the stationary engines it is in the sub-base.

Write for free booklet "Letting Gasolene Do It." This book tells how you can save time every day in the week by using an R. & V. Triumph Engine.

John Deere Wheel Plows

With Quick Detachable Shares

John Deere Wheel Plows, known the country over as "Quality Plows" are now fitted with John Deere Quick Detachable Shares—an exclusive John Deere feature.

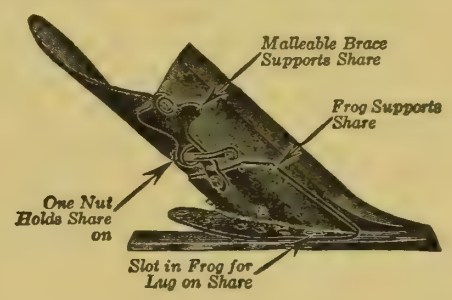
These shares are popular with farmers—they make hard work easy.

Superior Features

Unscrew One Nut—That's All

Unscrew one nut and the share comes off—slip share on, tighten the one nut and you are ready for work.

The share can be removed in thirty seconds and replaced in sixty seconds. Takes from eight minutes to half hour to change old style bolted shares.



Here's what John Deere Quick Detachable Shares mean to you:

1. No trouble to change shares.
2. Eighty per cent of time saved.
3. No danger of damaging share.
4. Share is drawn up closer.
5. Share is stronger—not weakened by bolt holes.
6. Resharpened or sprung shares can be drawn into place—no drift punch necessary.
7. No unequal strain on share.
8. No danger of injury to hands in taking share off.

We have beautifully illustrated booklets on the following plows with John Deere Quick Detachable Shares:

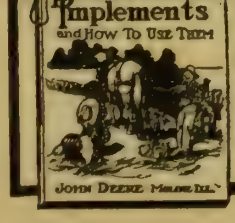
New Deere Sulky and Gang
(High Lift Frame Plows)

John Deere Stag Sulky and Gang
(Low Lift Frameless Plows)

John Deere Two-Way Sulky
(Side Hill or Irrigated Land)

John Deere Engine Gangs
(For Traction Engines)

Write for the booklet above that you want and we will send it to you free.



Better Farm Implements and How to Use Them

FREE BOOK Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, discs harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X-111.

ARIZONA REJOICES

The liberal rains of the past season have visited so much of blessing generally and in particular have so filled to overflowing the Roosevelt reservoir that Arizonans are calling upon the world to come and help in giving thanks and celebrating. April 15 is named as the day. The reservoir is now a lake 28 miles in area, large enough to float the navies of half a dozen nations. Over a million-acre feet of water! Enough to last the Salt River Valley for three years or more. This is the result of the building of the Roosevelt Dam. Stored water is now on hand in sufficient volume to insure crops and prosperity on 200,000 acres for several seasons.

This is the reason for the big celebration which has been planned to take place on April 15 at the Roosevelt dam when it is expected the water will be overflowing the spillways. The vice president of the United States, the Hon. Thomas R. Marshall, will be in Phoenix and will take part in the celebration with many other notables who have been invited to attend. The trip to the dam, 80 miles from Phoenix, will be made by hundreds in cars of every make and description.

POULTRY FEDERATION

Geo. H. Croley of San Francisco is doing some good work for the Federated Poultry Association of California. Poultrymen generally realize that, under present conditions of prices of feeds and prices of products of the poultry ranch, unless poultrymen stand together to secure the greatest good for the industry, many connected with it will go to the wall. One feature for which the federation is now working is an appropriation from the state legislature which may be used to encourage the poultry industry. Mr. Croley writes us that the bill introduced by Mr. Bonde of Sebastopol is in the nature of an emergency measure which will give poultry interests certain support in case the agricultural bill fails to pass. Regarding this bill and this appropriation Mr. Croley writes: "The appropriation is not sufficient to accomplish a great deal, but we must regard it as a nest egg."

Many appropriations have been made to aid agriculture and horticulture, but never anything specifically for the poultrymen, yet even the fruit interests of this state are hardly greater than are those of the poultry industry.

BEANS

Never has this paper received so many requests for information as to culture of beans of different kinds as this year. There is apparently a feeling that the demand for staples will be great, and we doubt not nothing will command better market than will California beans. This state has a record for producing beans of the finest quality, and the famous Boston baked are doubtless famous by the fact that they are usually grown in California. California ships immense quantities of beans to Boston. California beans show lower content of moisture than nearly all Eastern grown beans.

As to market, it is not always the best, but cooperative organizations by disposing of the greater part of the crop are maintaining a fairly stable condition. It appeared a few months ago that the Lima Bean Growers' Association was disintegrating, but we believe that now all differences have been harmonized and the association will be stronger than ever. If the association is strong it assures fair returns to the grower. Growers of other kinds of beans may well follow the example of the Lima people and perfect organizations for the handling of their crops.

A. P. A. IN CALIFORNIA

Chief Lively of the department of live stock of the Panama-Pacific International Exposition is pounding with sledge hammer blows in his effort to secure the next annual of the American Poultry Association for San Francisco sometime during the coming summer or on the dates suggested by Director Lively, November 18 to 28, which is the time of the poultry exhibits at the exposition. This organization has been in existence for 40 years, and not once in that time has it ever held a session on the Pacific coast. So Mr. Lively has adopted the slogan, "Once in 40 Years." It rather appeals to us that if the American Poultry Association desires to be of widest influence that "Once in 40 Years" is hardly often enough to hold this association on the Pacific coast. It seems that the ballot is to be taken early in the present month. Of course it goes without saying that California members will vote in favor of the California meeting, but those who have friends in the East who are members should write and urge that a spirit of fairness be shown toward the Pacific coast in this matter. Mr. Quisenberry, who is director of the Missouri experiment station and also a member of the A. P. A., has been placed in charge of the poultry exhibits at the exposition, and this recognition extended by the management of the exposition should certainly aid in securing a favorable vote from the majority of the members. We are told that Nashville and Atlantic City are both making a great pull to secure the meeting.

CITRUS MARKET

In the discussion of the high cost of living of course it is common to pass the responsibility on to the other fellow. In the matter of marketing citrus fruits the same line of argument is followed. Naturally the retailer claims the jobber has the big end, the jobber passes it back to the railways, the railways to the producer and the producer in turn points to the retailer. It seems to us that the producer has rather the best of the argument when it is shown that the retailer is getting 33 per cent of the consumer's dollar while he himself gets but 26. But here the producer must consider that much of the 33 cents is for service, such as delivery, and is not profit.

For example in buying a dish of prunes on the Southern Pacific diner one pays 25 cents for somewhere in the neighborhood of a dozen prunes. Two cents per prune would look exceptionally good to the producer who is getting not far from two cents per pound, but Southern Pacific cream and sugar and, more than all, service must be paid for, and the service is such that the payment is usually willingly made.

But regarding the high prices in Eastern retail markets. Mr. Young in his article on Page 389 last week referred to oranges in Kansas City retailing at 40 and 50 cents. On this point a bit of investigation has been made, and an average of prices at the best stores in Kansas City—this does not include fruit stands and push carts—was found to be as follows: Oranges, 96's to 126's—these are the grades usually placed in the front windows as especially fine drawing cards and the ones from which we are apt to take our estimates—were selling at 35 cents to as high as 50 cents. 150's—this is the average size—were running 26 cents to 40 cents per dozen; 176's, 20 to 25; 200's, 18 to 22; 216's 15 to 20, and 250's to 288's, 15 cents and under.

In some markets immense quantities of California oranges are selling today at 12 and 15 cents, and consumers in various parts of the East have reported that they never secured such good oranges at such low prices as this year.

Note, as we say above, the grocer displays his finest and largest stock at the front door, while the great bulk of the fruit which goes to the trade is in the back room from which deliveries are made. There is one thing to which the producer must give more attention, and this is the matter of service. If the jobber or the retailer is to be put out of business by the producer delivering direct, then the producer must assume the expense of service such as the high-class retailer gives.

The Cultivator's life depends upon the integrity of the producer's dollar being maintained, and it is vital that the producer should have a reasonable showing when the consumer's dollar is divided up. But it is equally as vital in discussing this question that we lift ourselves away from our orchards and put ourselves in the markets where our fruit comes into competition with fruit from all other sections. We must look at the conditions we have to meet if we proceed with marketing our own fruit.

In the time of business depression when many, we may say all, kinds of business are fighting for existence we producers must move cautiously in any effort to better our condition.

COVERS THE GROUND

I take more pleasure and get more good from the Cultivator than from all others put together. In fact the Cultivator covers the ground so well that I have cut out most of the other papers.—E. K. Grant, Wasco.

Agricultural Notes

Florida Valencias are reported as starting to move to market.

152,903,000 bushels, or 17.2 per cent, of the 1914 crop, against 151,809,000 bushels, or 19.9 per cent, of the 1913 crop on farms March 1, 1914.

Sugar produced in Hawaii during the year ending June 30, 1914, amounted to 612,000 short tons, the largest output ever recorded for that territory.

Now comes Minnesota with a "Potato Week" to be observed April 5 to 10. If recollection serves, New York celebrated the preceding week. Who's next?

Apple exports from both western and eastern ports were 24,000 barrels less than the preceding week, owing to lack of transportation facilities. London received the bulk of these shipments.

The level of prices paid producers of the United States for the principal crops increased about 2.5 per cent during February; in the past seven years the price level has increased during February 1.6 per cent.

The United States department of labor has established a national labor bureau where farmers and farm helpers may register. Application blanks may be secured from the nearest postoffice and forwarded free to Washington if returned to postmaster or rural mail carrier.

Berry boxes need not be marked with net weight of contents. The United States department of agriculture has just anounced suspension of the new container law as applying to berries and small fruits for the coming season, that is, until November 1, 1915. It is the view of the department's solicitor that no marking of quantity of contents is necessary upon the crates or boxes of any berries or small fruits.

The average time of steamships from Pacific coast ports to England is about one-half what it was before the opening of the Panama canal. Grain ships arriving at British ports from San Francisco and Portland since the opening of the canal have averaged 48 days for the voyage. The best record made was 34 days. Last season (1913-1914) most of the grain went by sailing vessels around the Horn. Their voyages averaged 136 days.

The Southern Railway, quoting from the annual report of its agricultural agent for 1914, says that in 12 months the field agents of the company have given advice to about 100,000 farmers. The average yield of cotton per acre on fields cultivated in accordance with their advice was 1,255 pounds of seed cotton, as compared with 513 pounds in other fields: Average yield of corn 40.8 bushels, as compared with 18.4 bushels in fields where their advice was not followed. Even in boll weevil territory many farmers averaged a bale or more of cotton per acre.

There is no immediate demand in Russia for American cotton. Large amounts purchased some time ago have not arrived and purchasers prefer to await their arrival before giving additional orders. The congestion at Archangel and on the Siberian lines is paralyzing private business. One shipment of cotton was removed from Archangel by sledges. The government taxed this cotton 2.50 rubles per pood (3.6 cents per pound), claiming that it was subject to the domestic war tax because not shipped by rail. This incident is retarding imports.

Agricultural News Notes of the Pacific Coast

Northern California

Butte County has planted over 25,000 olive trees during the past season.

Napa County dairymen are considering the advisability of forming a cow testing organization.

The University of California has many requests for qualified managers of large farming properties.

The Agricultural Club of the state farm school visited recently various ranches near the school at Davis.

The Placerville Fruit Growers' Association is building a 40 by 70 packing house which will cost about $1200.

Pear growers along the Sacramento River have been giving thorough sprayings to prevent ravages of thrips.

The Yolo County Swine Raisers' Association is doing some magnificent work in its efforts to wipe out hog cholera.

Horticultural Commissioner Harney of Yuba County is waging a fight on yellow scale of citrus trees near Wheatland.

Manager Tucker of the California Almond Growers' Exchange estimates an exceptionally large tonnage of almonds this year.

Fruit growers of the Sacramento River district are uniting in a campaign of advertising their fruits in Eastern markets.

Berry growers of Olinda, Shasta County, have formed an organization to take charge of marketing the coming season's crop.

State Horticultural Commissioner Cook is inaugurating his campaign of examining all incoming seeds or plants from Eastern states.

Woodland, Yolo County, hopes to be chosen as the location of a great milk cendensary. It will call for the investment of about $25,000.

The irrigating system supplying farmers near Los Molinos, Tehama County, has been improved by dredging and cleaning of ditches.

Swine raisers at Walnut Grove, Sacramento County, are combating an epidemic of hog cholera which has spread to nearly all herds in that section.

A hog breeder at Lodi recently had a number of pure-bred hogs returned to point of shipment in Missouri because of quarantine against foot and mouth disease.

The Ladies' Silk Culture Society of California, which has a plant located at Rutherford, Napa County, has a most attractive exhibit at the Panama-Pacific Exposition.

The state compensation insurance fund wrote during 1914 compensation insurance requiring the payment of $545,161. The operating expense was eight per cent and 15 per cent of the premiums is being returned to policyholders.

An interesting meeting of the Napa County farm bureau was recently held at Napa and report of a committee made that it was not advisable at this time to purchase warehouse for use in marketing products of the members. Another point discussed was the naming of ranches and having signs bearing owner's and ranch names.

Central California

Fresno is raising a $10,000 Raisin Day fund.

Wheatville, Fresno County, will plant 160 acres to rice.

Fresno merchants have distributed over 36,000 Raisin Day stamps. April 30 is the date.

The annual meeting of the Alta Cured Fruit Association was held at Dinuba last Saturday.

The Cooperative Cantaloupe Growers of Turlock have filed articles of incorporation at Modesto.

The light rain which fell early last week in all sections of the valley gave assurance of a big grain crop.

A Holstein breeder at Modesto has just sold a bull to the Carnation Stock Farm in Wisconsin for $1000.

The Tulare County free library is supported by an appropriation of $14,000 and is doing some magnificent work.

The Dinuba grange at a recent meeting began pushing a campaign for securing a farm adviser for that district.

Watsonville is now shipping Pajaro Newtown Pippins to London. The valley has shipped nearly 4000 cars this season.

A cooperative creamery has been organized at Los Banos and a $40,000 plant is contemplated. Nearly 3000 cows are already signed up.

Twenty pure bred Merino rams were last week shipped to the Hawaiian Islands by Charles Kimble, one of the largest ranchers in the San Joaquin Valley.

Raisin growers of Kerman, Fresno County, were addressed by the president of the Associated Raisin Company and its general manager last Saturday.

A raisin meeting was held at Kerman Saturday evening, April 3. President Giffen and Manager Madison of the Associated Raisin Company addressed the growers.

Outside of county nurseries are planning to test the Tulare County ordinance which demands a $5000 bond as guarantee that infected vines will not be shipped into that county.

Kingsburg, Fresno County, is now assured of a cooperative cannery which will be affiliated with the Porterville and other coopeartive canneries in one central buying and selling agency.

The San Joaquin Valley Counties Exposition Association, at its recent annual meeting elected George C. Roeding of Fresno, president; John P. Irish, Stockton, vice-president, and C. H. Edwards of Merced, manager.

A new citrus fruit exchange has been organized in Tulare County. This will increase the cooperating fruit in that county 15 per cent. The new organization will be known as the Lindsay-Merryman Citrus Fruit Exchange.

Professor Stubenrauch of the University of California and C. W. Mann, head of apple inspection of the Pacific Coast of the United States department of agriculture were in Watsonville last week looking over cold storage apples. They talked with growers on causes of brown rot in storage apples.

Southern California

Prices received for Imperial Valley asparagus have been very satisfactory.

Poultrymen of Southern California have organized a cooperative egg marketing concern.

The driving club at Hemet, Riverside County, held its spring matinee Friday, April 2.

As yet the Panama Canal is not proving of as much value to citrus growers as was anticipated.

Poultrymen of Arlington, Riverside County, are generally uniting with the Federated Poultry Association.

Imperial Valley has just shipped 1000 bales of cotton to Japan. This completes a 4000 bale shipment.

People of Imperial County are planting their greatest cantaloupe acreage. It will be not far from 1800 acres.

Contract has been let for the construction of the county highway between Perris and Hemet in Riverside County.

Southern California counties are planning for ornamenting borders of all state highways that have been constructed.

One hundred and sixty acres of land is being cleared at Encinitas, San Diego County. The entire tract will be planted to beans.

Hemet, Riverside County, recently made a shipment of a carload of canned olives. These were practically all from one ranch.

The Riverside Portland Cement Company recently fired a charge of 60 tons of dynamite to break up limestone in the hill near Riverside.

The first shipment of Bermuda onions to reach the Los Angeles market this season were sent in by a Calexico grower. There were 25 crates in the shipment.

The El Monte Walnut Growers' Association is laying plans for the erection of a walnut packing and shipping house in El Monte. This association is a member of the State Growers' Association.

County Horticultural Commissioner Waite of Imperial County is urging all melon growers to distribute ladybirds. He is now distributing over 7,500,000 of the little friends of the melon grower.

Cantaloupe growers of Imperial Valley are entirely at loss as to the attitude of the government in its anti-trust campaign. They fear they will not be allowed to market cooperatively their season's output.

Brawley, Imperial County, will produce over $50,000 worth of green peas this season. The growers are contemplating the formation of a cooperative marketing concern. The sixth full carload was recently forwarded to Chicago.

Manager Powell of the California Fruit Growers' Exchange advises caution in the enacting of laws to regulate shipment of immature or frosted citrus fruit, as he says there can be no wise legislation on citrus standards until the department of agriculture shall have completed experiments now under way.

The Coast

About 1000 acres of cantaloupes are being planted in the Salt River Valley of Arizona.

The agricultural college of New Mexico is giving short courses in home economics.

Texas has been finding difficulty with its early onion crop because of continued cold season.

Fishery grounds off the coast of Oregon are developing great possibilities in halibut supply.

The Oregon State Hop Growers' Association recently organized at Salem has a membership of 600.

The disturbances in Mexico have caused a shortage in stock of sisal fiber used for binder twine.

Walla Walla, Washington, swine raisers are not producing enough stock for their own home use.

A Tucson, Arizona, boys' corn club winner 18 years old, made a showing of $64.90 net profit from one acre of ground.

North Yakima and other points of Washington report a season much later than last year in nearly all fruit districts.

Cattlemen of Greenlee County, Arizona, have formed an association. A. H. Slaughter is president and Wade Hampton, secretary.

Dairy cattle of the agricultural college of New Mexico are being rigidly tested and several have been admitted to advanced registry.

Apple growers of the Hood River district are contemplating receding from the North Pacific Cooperative Marketers' Association.

The Aravaipa Cattle Growers' Association, Arizona, has voted to join both the State and American National Live Stock Associations.

Utah County in the state of Utah is planning a big campaign against potato and grain diseases under direction of County Agriculturist A. B. Ballantyne.

May 5 has been fixed as the date for dedication of the Dalles Canal, Columbia River, Oregon. It will give free waterway from the Pacific Ocean 479 miles to Lewiston, Idaho.

The Southern Arizona fair held recently at Phoenix called out a great exhibit of productions of the southern part of the state and an exceptionally strong exhibit along educational lines.

Stockmen of Mora, San Miguel and Guadaloupe Counties of New Mexico have organized an association to protect its members against cattle rustlers who have been very active the last few months.

Growers of the Wenatchee Valley of Washington are cooperating to secure a loan from Seattle banks to move the 1915 fruit crop. A $500,000 loan is asked for, the maximum amount to each grower to be 30 cents a box.

A conference of state veterinarians of Arizona, New Mexico, Texas, California and the Northwestern states was held March 23 at San Francisco to discuss uniform quarantine regulations on live stock shipped from the foot and mouth infected states of the East.

DE LAVAL

Cream Separators are by far the most economical

Real economy is never short-sighted. It never confuses PRICE with VALUE.

PRICE is what you pay for an article.

VALUE depends upon the amount and quality of service the article gives you.

You get by far the greatest actual VALUE for your money when you buy a De Laval — BECAUSE it will give you much better and longer SERVICE than any other separator.

From the standpoint of its greater durability alone the De Laval is the most economical cream separator to buy, and when you also take into consideration its cleaner skimming, easier running, greater capacity and less cost for repairs, the price of the "cheapest" machine on the market is most exorbitant compared with that of the De Laval.

And there is no reason why you should let its FIRST COST stand in the way either, because the De Laval may be purchased on such liberal terms that it will actually pay for itself out of its own savings.

A De Laval catalog to be had for the asking tells more fully why the De Laval is the most economical cream separator, or the nearest local De Laval agent will be glad to explain this and many other points of De Laval superiority. If you don't know the nearest local agent, simply write the nearest De Laval main office as below.

Live Stock and Dairy

FEED THE PIGS

As soon as we see a bunch of hogs, old and young, shifting for themselves, as they do on many farms, or at best getting only a taste of corn to help them keep up the struggle until the corn crop is made, we think of Maud Muller sighing over what might have been.

Those shoats might have been farther on the road to market and worth so much more if they had been given a chance to convert each day a few more pounds of corn or mill feed into growth. They would most willingly have returned double, and possibly triple, value for the few pounds extra of feed. It takes very little more above the food of support to make market growth, and in that little more is where we get profit in growing shoats. The profit is not in the food of support, as we may find by feeding a pig as long as we like just enough to keep it holding its own. At the end of the period the pig is no heavier than when we began this unprofitable test, and possibly its growtb is so checked that we will have expended more time and feed for the future gains than those gains could have been made for before this long suspense of growth.

It takes a lot of good feed to fill out the lines of a shoat that has long been on such short feed and get him back to the form of thrift that he showed when he left his mother to shift for himself. No man ever saw a pig making profitable growth or doing a fraction of what he is capable when his hair is dry and standing every way, his belly girth double that of heart or flank, as many a shoat shows today, and all because of lack of a little more feed.

Because corn is high and mill feed very high is no adequate reason for withholding the little of it to keep the pigs thrifty. It is the thrifty pig that pays. The thrifty pig is getting enough to satisfy his appetite at least, once a day, with the chance to add to it from the range allowed him.

We hear a great deal about testing cows by weighing the milk of each day by day to find the ones that pay and the ones that do not. If the slack feeder of shoats, or believer in self-shifter, would weigh such pigs once a week or month, and the feed given them, he might learn something to pay him well for his trouble. There is just as much need to check up pork makers as to check up dairy cattle to find unprofitable management. Professor Haecker said somewhere there is more need of checking up owners of dairies than the cows. The same may be said of owners of hogs. Too many act on the theory that the least care and feed is better than the best care and generous feed.—P. C. Holme in American Swineherd.

Austria has decreed that every acre must be utilized for production. Wasting land is the worst form of extravagance.

Live stock is the foundation of permanently successful farming today, as it has always been.

The farmer who conserves his best stock for breeding will profit greatly in the future.

FOUNDATION STONES FOR SUCCESS IN AGRICULTURE

VETERINARY SCIENCE

By Clarence M. Haring, Professor of Veterinary Science

Men and animals are subject to the same physiological and hygienic laws.

A proper balance of work and food maintains animal health.

Sanitation is essential to the prevention of disease.

All infectious diseases are due to living organisms.

Contagious diseases may be prevented by destroying or preventing the dissemination of the specific organism.

Immunization is desirable when other means of prevention are impracticable.

Prevention always pays; curative treatment may pay.

It is more economical to prevent disease than to cure it.

Wherever animals are gathered in large numbers extra precautions must be taken to prevent disease.

Most germs are harmless, many bacteria are helpful.

Living bacteria, or germs, are present nearly everywhere, one exception being the tissues of healthy animals and plants.

Working young horses before their bones are matured is a frequent cause of later unsoundness.

Constant vigilance is necessary to keep a herd of dairy cows free from tuberculosis.

Health in man often depends on health in beast.

Infants may contract tuberculosis from the milk of diseased cows.

The responsibility of the owner of diseased stock does not end at the border of the ranch.

The consumer who buys milk on the basis of cheapness may expect to get a dirty product.

Demand clean milk from healthy cows.

THE PIG CREEP

Mr. E. K. Grant of Wasco writes: "The article in your live stock department of March 18 describing pig creep is certainly a good one. I have several panels 16 feet long made of 5—1x4 strips, the bottom cracks are only about 3 inches and the top one 8 inches. In making a pig creep I use three of these panels, fastened to the fence with baling wire, forming a square. By turning one of these panels upside down the wide crack will allow the small pigs to get in and keep out the older ones. This leaves a 1x4 strip along the ground which keeps old hogs from rooting under and also keeps the pigs from pushing their feed under the panel where the older ones can get it. Any time it is necessary to catch the pigs call them into the creep with some feed and turn the panel right side up, and you have the pigs without fuss or trouble. These panels are so handy in so many ways that a hog raiser can't afford to be without them."

HOW MANY SHEEP PER ACRE?

Regarding the acreage of alfalfa required to feed a band of sheep, it would seem that seven lambs could be fed five months on each acre. The basis for this estimate is secured from the amount of hay required for feeding sheep and an estimated yield of about five tons of alfalfa hay per acre. It is possible that you have a heavier crop of alfalfa and that you could carry more animals, but I would place 14 as a maximum from May 1 to October 1.—R. H. Williams of Arizona Experiment Station.

RECORDING COW QUALITY

In many dairy sections in Canada it is quite possible, judging from official figures, to find a herd of cows producing milk at a feed cost of only 62 cents or less per hundred pounds, while on a farm two miles away milk costs perhaps 90 or more per hundred for feed. And on that farm where milk costs more may often be found some dairy requisites, such as a pure bred dairy sire, good ensilage, etc. Other requisites may be lacking, well rounded dairy judgment, cow quality.

Solid and lasting success is attained more easily and more quickly by the intelligent use of dairy records. This is just common sense selection of paying cows instead of the indiscriminate boarding of "just cows." The individual cow of good promise is quickly and unerringly spotted by the use of simple dairy records and fed for better production at less cost, while the antique souvenir, useless as a profit-maker, is beefed because she lacks ability to prooduce milk at a reasonable cost for feed.

The man who raises his own calves can take quick strides in building up a good herd, for he keeps only his best cows and knows just what he has. The man who sells, often sells his best cows for a song (this is the plain history of some world-champion cows) just because he does not know what good cow quality he has; dairy records would have informed him.

A matter of ten minutes per cow per month spent in recording will put surprising, most illuminating results before any herd owner, indicative of great possibilities at present dormant in his dairy cows.—C. F. W., Dominion Department of Agriculture.

CALIFORNIA SWINE BREEDERS

The annual meeting of the California Swine Breeders' Association will be held in the Hall of Congresses, at the Panama-Pacific Exposition grounds, on April 23, 1915, at 9:00 a. m.

Mr. H. L. Thatcher will speak on "Auction Sales and the Hog Business," and Dr. Bert J. Cady, of the United States department of agriculture, on "Hog Cholera and Its Control."

The rest of the program is not as yet complete, but will include one, and perhaps two, instructive talks by well-known speakers.—J. O. Thompson, Secretary.

LUNGWORMS IN HOGS

Lungworms are one of the most common parasites of swine. They are thread-like in appearance, brownish-white in color, and vary in length from three-fourths to one and one-half inches. They are found in the finer divisions of the bronchial tubes, mixed with mucus which is secreted in abundance as a result of their presence.

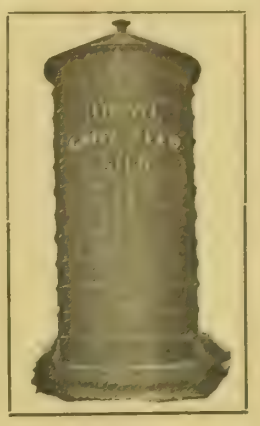
When in small numbers they cause but slight damage and are most often overlooked. Young hogs often become badly infested and death frequently results in pigs poorly cared for. In slight cases coughing is most pronounced. In those badly infested, coughing, diarrhoea, weakness, and lack of thrift, (symptoms sometimes mistaken for cholera) are most pronounced.

Treatment as a rule is worthless on account of the inaccessibility of the parasite and the difficult method of application.

Prevention is the only ground on which we can expect to control this trouble. As moist yards afford a good place for the development of the eggs, the yards should be located on

AN IDEAL GREEN FEED SILO

Is not merely a tank or a barnyard building, but is a THOROUGHLY PRACTICAL PIECE OF DAIRY EQUIPMENT.



Over Twenty Years of Practical Experience

in silo building has enabled us to overcome the difficulties in silo construction and to build a silo that will return to you as good ensilage every pound of good feed you put into it.

To experiment will be expensive for you. Why not profit by the experience of over 20,000 users of the

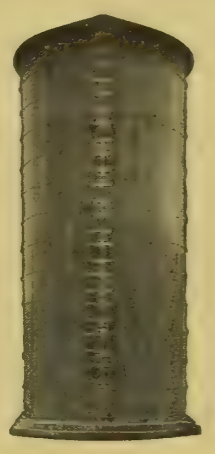
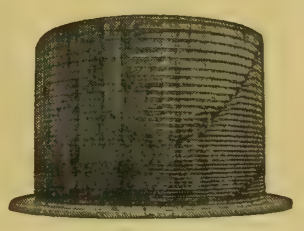
16 x 36 Redwood Stave Silo manuafactured by us for the Panama-Pacific International Exposition, San Francisco, 1915



TANKS

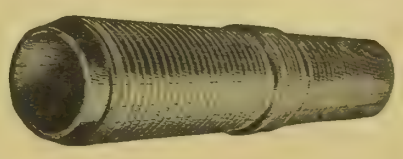


Built to order, to suit all uses and users. Cheaper than metal tanks, last longer. Won't rust. Can be taken down and re-erected without damage. Capacities, 500 to 500,000 Gallons. Towers included if you want them.

PIPE

MACHINE BANDED OR CONTINUOUS STAVE

For water supply—irrigation or power. Cheaper than any other pipe of equal size or capacity. Longer lived than any metal pipe except cast iron.



All our silos, tanks and pipe are designed by engineers to meet every condition. Made in our big factory from CLEAR, AIR DRIED REDWOOD. Selected from a stock of 40 million feet which we carry at all times.
